The Florida State Fair will be held at Jacksonville November 19-22; general manager, G. S. Henly.

An interesting display of French fruit was shown at the Pan-American Exposition September 24, being sent by the Syndicat Central des Primeuristes Francaise. It was the desire of the senders that the fruit should be shown at the meeting of the American Pomological Society, but it did not arrive in time. The fruit consisted of five distinct lots and comprised nine varieties of grapes, three varieties of apples, nine varieties of pears, five varieties of peaches and one variety of muskmelon. It was shipped by mail from Paris, September 12, leaving Havre by steamer Aquitaine, September 14, reaching New York September 21. The time consumed in transit —11 days—was, unfortunately, too long for the requirements of melons and thin-skinned grapes, and these fruits consequently arrived in bad order. Certain thick-skinned grapes, including Black Alicante, Boudales, Angelino and Director Tisserand, and all the pears and apples, came in excellent condition, and were found to be very fine examples of their respective varieties.

The dates for farmers' institutes to be held in New York State the coming Winter are now being arranged by the director. About 1,200 applications are on file, and while this is more than three times as many meetings as can be held, there are still some sections of the State from which no applications have been received. If our readers care for meetings in their respective localities, and will send an application at once to F. E. Dawley, Director Farmers' Institutes, Fayetteville, N. Y., the application will be considered, and if there is an opportunity for holding the meeting it will be placed. Quite a number of new speakers have been placed on the list this Winter, and the present outlook points to a most successful series of meetings.

The Kansas State experimental creamery plant at the Agricultural College, heretofore operated only in the Winter, will after November 1 be operated the year round and the product sold on the market. The Continental Creamery Company has consented to remove its skimming station from Manhattan and so give the State a monopoly of that territory. The object of the State's plant, of course, is the instruction of students in the art of making butter, and this can only be done by running it all the time. The profits of the plant will pay the expense of maintenance, and so the State will be out nothing.

The National Cattle Show, to be opened at Kansas City, Mo., October 21, is expected to excel all previous shows there. The fact that there is to be a combination exhibit and sale of the three famous breeds of cattle—the Herefords, Short-horns and Galloways—is to a great extent responsible for the interest shown this year, although the success of the combination show of Herefords and Short-horns last year also had something to do with it. The entertainment to be provided for the visitors this year and the accommodations for the cattle will be superior to what they were. The new $10,000 show barn, where the thoroughbreds are to be stabled, has been completed. The cattle will be shown and judged in a large tent near the sale pavilion, but the public will also be admitted to view the animals in their stalls in the new show barn.

An alarming disease has made its appearance in the potato fields of France, according to a report received from Consul Covert, at Lyons. It causes the leaves of

GEORGE L. FLANDERS. FIG. 323.

the potato to dry up, while the stem becomes thin and covered with yellowish spots, and finally dies. The veins of the leaves fill with a gummy substance, and are infested by bacteria. The disease first attacks the roots, and then invades all parts of the plant. The bacteria is said to be identical with that which once attacked tomatoes and egg plants in the United States.

GEORGE L. FLANDERS.

President-elect of the National Farmers' Congress.

At Fig. 323 is shown a good picture of Geo. L. Flanders, the newly-elected president of the National Farmers' Congress. Mr. Flanders owes his election to the fact that he has defended the dairy interests of this country with great ability, having devoted many years to an exhaustive study of the legal aspects of the oleo cases. He is a successful farmer, as well as a good lawyer, and First Assistant Commissioner of Agriculture. He is especially useful in this position, since he has made a careful study of constitutional law as it applies to the police powers of a State, and inter-state commerce. This is of great importance in handling the oleo question owing to the former conflict of State regulations.

Mr. Flanders is a native of St. Lawrence Co., N. Y., and is now in the prime of life. He entered the State's service in 1884 as assistant to Dairy Commissioner Brown. At that time the present department had not been created, but large sales of oleo were made and the adulteration of milk had grown to be a great abuse. Mr. Flanders did his share in the work of organizing the fight against these evils. This work was done so thoroughly and well that now no oleo is made in the State, and but little of it sold. Pure milk, with the exception of some partial skimming by creamery men, is the rule. To show the growth of this police work for pure food we may say that in 1893 the present department was created, and now there are 20 articles under its supervision instead of only two as formerly. It is a strong tribute to the ability of Mr. Flanders to say that he has held his position through at least five different administrations—both Republican and Democratic. We believe that he has always been true to the interests that he represents. It is safe to say that no influence would cause him to hesitate in the performance of his duty as he saw it, and his official duties are not made secondary to the furthering of personal or political ends. It is a good thing for the dairymen of this State and country that a man like Geo. L. Flanders is in a position which enables him to strike commanding blows at the oleo fraud.

IMPORTED POTATOES.

Imported potatoes come from Canada, New Brunswick and Nova Scotia. The kinds are similar to those grown in the States, except those from Nova Scotia. There the main crop is Blue Mercer. From across the ocean, Scotland, England, Ireland, Germany, Belgium, Italy and France have all had small trial shipments here this year. In no case this season have the shipments been a financial success. The stock from Great Britain is usually liked in this market, and consists of Magnum, Favorite and Bruce. The potatoes from the Continent are usually too small to suit the trade, and are not handled as well, nor are they properly sorted.

New York. FURMAN & PAGE.

Regarding imports of European potatoes, our information would lead us to say now if the market gets to $1 per bushel here that there will be large imports. It is generally supposed that Glasgow sends the best stock. Potatoes have come to this country from Scotland, England, Germany, Belgium and a few from Holland. The freight figures about 15 cents a bushel, duty, 25 cents, other expenses, five cents; which would make an expense of 45 cents. We understand that they are glad to sell potatoes on the other side at 40 cents a bushel, which would make them cost delivered in this country, say 85 cents. We are told they have a good quality and good quantity this year. Buyers on this side have shunned them somewhat because the potato was black-skinned, showing it had been grown in black soil, but they cook well, and are mealy, which is the prime requisite for a good potato in the United States. The name of the variety of which most come here is Magnum. There have been many letters sent to this side regarding shipments of potatoes this year. They all hang upon how high our market will be. It is our individual opinion that next January, February and March a good many potatoes will come across. We have some doubts about our market getting to $1 this side of January 1. If the decay we hear so much about is as represented potatoes are bound to advance. We are told that Wisconsin and Minnesota have enormous crops. Maine, as you are aware, has a good crop. The trouble seems to lie in New York State. PATCH & ROBERTS.

Boston.

The Canadian Census Returns.

The farmers through this portion of the country take but very little interest in the returns given by the last census; it is a matter which one will scarcely ever hear discussed. By the bulk of the people the taking of the census is looked upon as a useless piece of work, and one which is undertaken merely to give jobs to the enumerators and other officials; consequently, when the returns are made public, no interest is taken, whatever, by them. There are some, however, who take more interest in all public affairs, but by these, for the most part, the matter is viewed with a party bias. The supporters of the present government claim that the census of 1891 was stuffed, and that therefore the gain in population is much more than is apparent, while the supporters of the opposition claim that it is owing to Liberal misrule that the people have been obliged to go elsewhere in order to gain a decent livelihood. It is not at all probable that the returns of 1891 were stuffed to any extent, as had this been the case, the matter would surely have been found out before this.

In the Province of Ontario, and possibly in many other portions of the Dominion, the birth rate is very low. Many of our young men are in the habit of seeking new homes, and what they consider better opportunities across the border. The competition of the large factories has driven most of the rural industries out of existence. These three things are the principal factors, I believe, to be considered in accounting for the small increase in population. Farm lands in this locality would not bring one-half as much as they would 20 years ago, and what is the case in this locality is probably that of most other portions, although there are, of course, exceptions in some places. Farm lands are not of easy sale, many farms being in the market for years before a buyer is found for them. Many live and up-to-date farmers are making as much or more from their farms now as in the past, but the great bulk of the farming community is not making nearly as good an income as in former years. F. H. P.

Smithville, Ont.

DISEASED CATERPILLARS.—I have just returned from a short trip up the Hudson River Valley and found there that the Fall web-worm had been a serious plague. But an interesting phase of the question presented itself: I found hundreds of the caterpillars had crawled up on to weeds and grasses and had then died from some fungous or bacterial disease. Their stiff and life-like corpses were very common in the fields, so that Nature seems to have arranged to take care of many, perhaps a large majority of this year's crop, so that they will not transform into moths for a next year's crop of eating caterpillars. It was a very interesting and instructive sight. M. V. SLINGERLAND.

COW PEAS IN WAYNE CO.—We had no frost here up to October 5 even to injure our cow peas or melons. The piece of cow peas sown in the apple orchard July 9 is now going down. A very rank growth, some of the stalks four feet long and all tangled up. Those sown in the vineyards July 25 and 26 are now about one foot high, and are still growing nicely. The Hairy vetch sown in apple orchard July 9 is now growing much better, and in open spaces between the trees is forming a thick mat. Some of the vines are three and four feet long, and well branched. The Alfalfa sown in apple orchard July 16 is knee high in the open spaces. So far I like the cow peas best, although the clover and vetch are gaining on them. B. J. CASE.

Sodus, N. Y.

Woman and Home

From Day to Day.

JOHNNY'S QUESTIONS.

Johnny's strapped his books and slate, and started off to school;
He's enjoined to study well and mind the teacher's rule;
He's advised to con his books and every lesson learn,
So that he may thrill the land when it comes his turn.
That is why his father has a most important task—
He must find the answers for the questions John will ask.

"Why don't water run up hill? Why don't scarecrows fly?
When was Julius Cæsar born? How'd he come to die?
Give a list of Presidents. Where is Reykjavik?
How is it that seven days only make a week?
How do you spell phthisis, Pa? Who was in the ark?
Where does all the daylight stay while we're in the dark?

"Why do pickles make boys sick? When was Moses born?
Pa, how many kernels is in a grain of corn?
Pa, who was it held the pass at Thermopylæ?
Was it like a circus pass? What is Labor Day?
Pa, what does a oyster eat? Do they live in beds?
Does the little oysters' mas have to comb their heads?

"What is germs? The teacher says they're on pencils, and
Must be antisepticized 'fore they touch our hand.
She says they must be removed, or 'twill never do.
Are they like us little boys—chew the pencils, too?"
Then his Pa will drop his book, and in accents deep
Say: "It's time that boys like you were in bed asleep."

—Baltimore American.

*

OUTSIDERS often find it hard to understand the enthusiasm of the artist or scientist for his specialty. The late Professor Riley, State Entomologist of Missouri, used gleefully to recount an experience he once had while investigating a locust and grasshopper plague in the West. He overheard a station lounger say to another, in contemptuous tone: "There was a long-legged loon here to-day who rushed about like mad, ketchin' grasshoppers, and holdin' 'em up by the legs, an' lookin' at 'em through a round glass like he never seen a grasshopper afore. I could git him a bushel ef he wanted 'em, an' they wouldn't cost him a cent."

*

Two of the new blues to be fashionable during the coming season are Napoleon and Baltic, the latter a little lighter than the Russian blue so popular last Winter. Among the reds, coquelicot is simply poppy; automobile a vivid shade that is neither cerise nor magenta, yet with a vague suggestion of both; phloxine a deep dahlia tint. Delft is a pale purple, not blue, as the name implies; bishop a deep purple, lobelia a soft lilac, and cyclamen a delicate heliotrope. Java and marron are two popular browns, the latter being merely chestnut under its French name. It is said that green will be a leading color, and it appears in an infinity of shades, from palest Nile to deep chasseur and myrtle.

*

POMPONS on the Fall hats are growing larger and larger, fatter and fluffier; it is hard to say where they will stop. A great many colored feathers are used in them, but the very smartest are still of black, white or black and white. White flaked with black chenille is very popular, and is the favorite trimming on a white or mode felt outing hat. Sometimes the pompons are of stiff feathers, sometimes of hackles tightly curled, but the most popular style is of ostrich feathers. Of course they are not cheap. Lace pompons are seen with jetted centers. We also see large stiffly wired lace flowers with jetted centers and yellow silk stamens, which will be used to trim Winter hats of velvet and fur. These flowers are made in both black and white lace, the white ones sometimes having a border of fine black chenille. It seems odd to combine lace flowers with velvet and fur, but the effect is good in black and white. Combinations of black and white have been very fashionable all through the season, and promise to continue in vogue.

*

WALKING dress at the present time is so sensible that one would think it difficult for any woman who follows prevailing modes to make herself deliberately uncomfortable or unsuitably dressed. Yet it often appears as though the greatest enemy to woman's progress and advancement is woman herself, just because she doesn't seem to realize the eternal fitness of things. When she knows enough to wear a short skirt on a rainy day, she ought to realize that a frilly, lace-edged white petticoat is not the thing to wear under it, yet every wet day we see this combination. She ought to know, too, that openwork stockings and patent leather ties with three-inch French heels do not harmonize with the rainy day costume, but she insists on wearing them. Madame Midas sets the fashion with a brooch formed of a costly miniature portrait encircled with diamonds, and as a consequence all sorts and conditions of women are now wearing libelous photographs framed in tallowy mock brilliants. Turquoise matrix, its veins and splashes set in rough gold, became the fashion, and thousands of silly women pinned their belts, their collars and their untidy back hair with tawdry metal set with something that suggests blue china door knobs. We have outgrown a good many foolish and ugly customs in dress; there is really no excuse for unbecoming

3924 Girl's Apron,
4 to 12 yrs.

clothes, however inexpensive they may be. Our future development, therefore, must be in the line of personal taste, and sense of fitness.

*

A WRITER in the American Kitchen Magazine for October discusses children's work in the home, giving answers received from a number of sources as to instruction given to children, and the help required of them. The most satisfactory response received was the following:

From the time I was five to 14 years old the work given me was for my training. It was regularly assigned, small in amount, and *always inspected*. If it was poorly done, it had to be done over again. It consisted at first in sewing. At 11 years I had made five quilts and had hemmed towels, napkins, etc. From 11 to 14 I learned to cut and make underclothes, and I made a cambric dress alone the last year. Then cooking. I commenced at 10 or 11 years. At first I learned to prepare vegetables, then meats, bread and cake making followed. From eight to 11 years I was taught the regular work in the care of the home: (1) dusting the sitting room; (2) care of the front stairs; (3) making beds; (4) lamps; (5) cleaning the lower cupboards in the pantry on Saturday; (6) cleaning the clothes closets at house-cleaning time. I occasionally wiped dishes.

That outlines a model course of home instruction. Any system of education which keeps a girl too busy to learn

3927 Child's Dress,
6 Mo. 1, 2 and 4 yrs.

anything about housekeeping during the formative period of her life is a failure in fitting her for the career she is most likely to follow.

The Rural Patterns.

Plain woolen Winter frocks cause a demand for little white aprons, either for school or home wear. The pattern shown is a very simple and pretty style. To cut this apron for a girl eight years of age, 2¼ yards of material 32 inches wide will be required, with 2½ yards of edging, 2⅜ yards of insertion, and ⅝ yard of additional material for sash ends. The pattern No. 3924 is cut in sizes for girls of 4, 6, 8, 10 and 12 years of age; price 10 cents from this office.

Pointed yokes, with bretelles falling over the shoulders, are exceedingly becoming to the little folk, and make a charming effect. This dainty frock is made of sheer Persian lawn, with all-over tucking and trimming of Valenciennes lace, but the design is suited to all fabrics used for children. The yoke is square at the lower edge and to it is attached the full skirt portion. The bretelles are shaped and slightly full; falling in soft folds. The sleeves are in guimpe style with frills falling over the hands, and the neck is finished with a straight hand or narrow collar. To cut this dress for a child two years of age 2½ yards of material 32 inches wide will be required with ¼ yard of tucking and 3⅞ yards of insertion to trim as illustrated. The pattern No. 3927 is cut in sizes for children of six months, 1, 2, and 4 years of age; price 10 cents.

A Photographic Competition.

PRIZES FOR PICTURES OF HOUSEHOLD SUBJECTS.

THE R. N.-Y. numbers many amateur photographers among its readers, and we receive, from time to time, interesting and novel pictures, which are reproduced in our columns. But there is one class of subjects which seems to receive very little attention, and that is the domain of the women folks. The picture makers like to take a shot at the new raspberry patch, or the barn, or the cow, but the comfortable storm door, the pantry that saves steps, or the way the boys help Mother when she has had an extra hard day, is neglected. To encourage this neglected field the Woman and Home Department offers the following prizes for the best pictures illustrating domestic subjects:

First Prize, $7.00.
Second Prize, $5.00.
Third Prize, $3.00.

The subject should illustrate, preferably, some idea or convenience, comfort, or saving of labor, but domestic episodes which form effective pictures will be considered. We desire photographs that show something, but that will also make attractive pictures. The prize winners will be asked to furnish descriptive notes to accompany the illustrations. The competition will be open until December 1. In addition to the prize-winners, other pictures which, though failing to receive a prize, are still considered worthy of use in illustrating, will be paid for upon use at our regular rates. Address all matter relating to this to the Woman and Home Department of THE R. N.-Y.

LIVE in a thankful spirit, and you will find more and more to be thankful for. Begin by resolving not to forget your mercies, and you will gradually come to feel the thought of them a constant inspiration to happiness.—Brooke Herford.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

Nobody else but me puts his name on lamp chimneys — there's mighty good reason for that. MACBETH.

If you'll send your address, I'll send you the Index to Lamps and their Chimneys, to tell you what number to get for your lamp.

The Rummage Sale at Crooked Creek.

When the Rev. Mr. McPherson, pastor of the Crooked Creek Immanuel chapel, announced from his desk that the Woman's Missionary League would hold a rummage sale, and that he hoped that everybody would contribute to it generously, a rustle of interest spread through his congregation. It is to be feared that during the remainder of the morning's service the topic of rummage sale was uppermost in the minds of the people, and that when church was out rummage sale, not sermon, formed the subject of discussion. Now, first to be settled, what was a "rummage sale?" Those in ignorance were enlightened by the better informed. A rummage sale—why, it was just what the term implied. The Crooked Creekers were expected to dig and to delve in garrets, and closets, and clothes-presses, and collect all their cast-away clothing and donate it to the sale, to be disposed of to the poor and needy.

The idea was deemed excellent. It took violently. The good housewives of Crooked Creek zealously devoted themselves to it, and long-forgotten depths, many a dark and slumberous corner, were ruthlessly invaded. What strange relics were unearthed in the eozoic strata of attic and of dusty trunk! Trousers and coats, hats and stockings for male and female, shoes, neckties, underwear, bandanna handkerchiefs, etc., ad infinitum, blinking at the day, and mutely protesting, no matter how spruced up, at thus being exposed, were conveyed to the chapel until it resembled the old curiosity shop, or a portion of a ghetto.

One of the most active promoters of the plan was Mrs. Riggs—popularly referred to as Mrs. *Deacon* Riggs. Unfortunate woman, at best the material she had available for the sale was scant indeed. Mrs. Riggs, as every one knew, was obliged to wear and wear and wear her clothes; and when finally she discarded them they made pretty hard picking for even the most greedy. In short, Deacon Riggs, her husband, was as close-fisted a man as ever existed in fact or fancy. He squeezed a dollar so that the whole household shared in the eagle's suffering. Like numerous other women similarly environed, Mrs. Riggs, repressed in her own home by an unsympathetic spouse, was fain to seek relief elsewhere. Her waters of human kindness and of benevolence, effectually walled and sealed by the deacon, found outlets at a distance. To her the rummage sale came as a comforting opportunity.

But what could she do? Little enough, she sadly ascertained, inasmuch as among the family garments not in actual use, was hardly one which she was not quite ashamed to send. Patched and darned, dyed and "turned," alas, a sorry collection. Nevertheless, by spirit of well-doing she tried to atone for lack of results, and she bent herself to trim a venerable hat, which had been new when she was a bride and which, in various guises, year after year through two score changing styles had done duty almost up to the very present. Although it was entitled to uninterrupted retirement she now dragged forth the battered frame, and proceeded to rehabilitate it. She was determined that at least *this* donation should be worthy, and not plainly something miserable and unserviceable. The poor have their self-respect, and it should be heeded.

She grew enthusiastic over her task; and her nimble fingers, accustomed, heaven knows, to making over and over fairly surprised her. The reward was a really decent bonnet, and Mrs. Riggs felt deservedly triumphant. To be sure, no amount of ribbons and buckles and what-nots could conceal the fact that the hat was extremely passé. Still, beside the other articles it was not unattractive. Indeed, it shone. Satisfied with her success, and vastly relieved at bidding good-bye forever to the bonnet, Mrs. Riggs hastened to send her contribution to the chapel.

The sale opened gloriously, and drew not only the people for whom chiefly it was designed, but many in addition who were impelled by curiosity, or by the purpose to secure a piece of apparel suitable for rough and soiling work—felt thereby they might help along the cause. Plenty of stock for all was in sight. As befitting a leading member of the congregation, mingling with the flow of customers and of spectators was Deacon Riggs, his furtive eyes twinkling, and his pursed lips occasionally expanding into a smile. A town character was Deacon Riggs; not a boy but at whom he had wrathfully shaken his stick, not a citizen but had, some time or another, been incensed by him. Now he strolled down the main aisle, peering right and left, as prodigal with his greetings as he was penurious with his pennies. At the end of the aisle he brought up in front of the hat booth. Here he hesitated, ere going farther on his tour of investigation.

"Bunnits, hey," he said, casually, addressing in a general way the proprietor.

"Yes, Deacon, take your choice," responded Mrs. Shaw, inside, with a smile of invitation.

The Deacon awkwardly fingered the headgear within his reach, acting as does the average man when confronted

3857 Box Coat, 32 to 40 in. bust.

3859 Girl's Three-quarter Coat, 4 to 12 yrs.

by a display of millinery. To the Deacon all hats looked alike.

"Humph!" he uttered, in a ruminative chuckle.

"How much for that there contraption?" he inquired, pointing with his cane.

"Only $4," promptly answered Mrs. Shaw. "It's real tasty, too."

"Purty high," mumbled the Deacon, with a disapproving shake of his white hairs.

"Why, Deacon Riggs!" remonstrated Mrs. Shaw. "That hat, if bought in a store, would cost you at least $10."

"Humph!" grunted the deacon.

"It's altogether too nice for such a sale," continued Mrs. Shaw. "See!" and she displayed it to more advantage, smoothing a ribbon in one spot, and encouraging a bow in another.

"Four dollars the best you kin do?" queried the deacon.

Mrs. Shaw, suspecting that he was in a jocular mood, fell in with his humor.

"The very best—yes, indeed," she asserted. "Want to try it on? There's a glass."

"Not much," retorted the deacon. He puckered and repuckered his thin lips. "I dunno," he resumed, reflectively, "but what you might ez well wrap it up for me, and I'll take it along. Pay you tomorrer."

Mrs. Shaw narrowly escaped fainting at the sudden termination, and one entirely unexpected of her efforts.

"Like ez not I'll find some pusson to give it to," said the deacon, as if in apology; "and it's boostin' the church a leetle, at the same time."

Without ado Mrs. Shaw, fearful lest the purchaser should weaken and change his mind, precipitately delivered the hat.

When the deacon had returned home that noon he went through into the kitchen, where Mrs. Riggs had been busy all the morning.

"Here, Marier—I've fetched you a sort of present," he announced, extending to her a bunchy, unsubstantial appearing package.

Mrs. Riggs eagerly grasped it. She loved surprises of a pleasant nature, and she rarely had them.

"Seems like you've been sayin' you needed a new bunnit," said the deacon, while his flushed wife fumbled at the pins, "and I've been holdin' off until money was a bit looser; but this mornin' I come acrost somethin' down town, and I says to myself, says I—."

Mrs. Riggs had removed the wrappings. The contents were exposed.

"There!" exclaimed the deacon, complacently. "Suits ye, doesn't it?"

His wife turned red, then pale. The deacon attributed her emotion to pleasure.

"Try it on, try it on," he urged, heartily.

The hat rolled to the floor. Mrs Riggs, stifling a strong desire to kick it, stooped and lifted it, with none too gentle a hand.

"No, not just now," she answered faintly. "I—I must get dinner. But thank you—very much, Saul."

Did a shade of sarcasm manifest itself in the concluding words, or did it not? At any rate the deacon, grandly moving on his way to the sitting room, was oblivious of it. Left alone in the kitchen, Mrs. Riggs slammed—yes, slammed—the hat—her hat—this hat which she had trimmed only 24 hours previous, and which she had fervently hoped never to see again—upon the cluttered pine table.

"Darn!" ejaculated Mrs. Riggs, in a sob, to her own great astonishment, and the scandal of the tea-kettle.—Edwin L. Sabin, in What to Eat.

Rural Recipes.

Vienna Apple Pie.—Peel and core five large apples; boil them in a little water till soft enough to press through a sieve; sweeten with three tablespoonfuls of sugar and flavor with half-teaspoonful of pistachio; beat the yolks of two eggs and add to the apples. For a Vienna apple pie use a lower crust only; bake it; fill with the apple; beat the whites of three eggs and one tablespoonful of sugar to a stiff froth; spread evenly over the top and brown slightly in a moderate oven. Eat cold.

Chocolate Boiled Icing.—Boil one cupful of granulated sugar with one-third of a cupful of water until it will thread when dropped from a spoon, remove from the fire and add two squares, eighth of a pound, of grated chocolate; add a teaspoonful of vanilla extract and then beat it slowly into the whites of three eggs which have been whipped to a froth. Spread over the cake at once.

Corn Biscuits.—Boil two cupfuls sweet milk; when cold stir in one cupful cornmeal; add one-half cupful soft yeast, two cupfuls wheat flour. Set to raise over night. In the morning add three well-beaten eggs, one cupful white sugar, one-half cupful melted butter, two-thirds cupful flour, one teaspoonful salt; set in a warm place to raise. When light stir in 1½ cupful flour, roll into biscuits, set to raise as before; when light bake in a moderate oven.

Cream Pie.—One cupful thick sweet cream, one cupful sugar, one small tablespoonful flour. Stir all together, add the whites of two eggs well beaten the last thing; flavor to suit the taste, and bake in one crust.

Wine Jumbles.—One cupful sugar, one cupful lard, one cupful molasses, one cupful currants, two teaspoonfuls soda stirred in molasses, one teaspoonful cinnamon, one teaspoonful cloves, one teaspoonful ginger, one teaspoonful salt, a little pepper, one cupful sour milk, one egg. Stir stiff with flour, drop on tins, sprinkle with sugar, and bake.

Dutched Red Cabbage.—Remove the outer leaves from a fine head of red cabbage and chop or shred; cover with cold water and let stand for an hour. Drain, and for each quart allow one tablespoonful of butter, one heaping tablespoonful of finely chopped onion, one-half of a teaspoonful of salt, a pinch of mace and two tablespoonfuls of vinegar. Cover and cook slowly until tender, adding one teaspoonful of sugar when half done.

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

WANTED—A trusty girl for general housework in New York City. Plain cooking. Must be pleasant with children. Send references with particulars, age, experience, etc A good home for worthy person. Wages, $20 per month. Address EMPLOYER, care THE R. N.-Y

BUSINESS BITS.

THE Standard Paint Co. cites instances where the P. & B. paper after being eight years in use, has been removed and found to be practically as good as when first put on. It is much used in the construction of poultry houses, stables, barns, etc., where its airtight and waterproof qualities make it invaluable. If your dealer does not keep it write to Standard Paint Co., 100 William St., New York.

AMONG the very first of the incubator and brooder concerns of the country to advertise in our columns was the "Reliable," of Quincy, Ill. The Reliable goods are reliable in works and results as well as in name, and those of our readers who contemplate the purchase of machines of this class can do no better than to buy the time-tested old Reliable. Their 20th Century Catalogue is, as usual, a work of great value. Write them to-day for a copy. Address Reliable Incubator & Brooder Co., Quincy, Ill., and mention this paper.

NEW conveniences are making farm work easy. Low-down metal wagons and the wooden-geared wagon with metal wheels are the greatest boon of recent years. They reduce weariness of both men and teams, and maintain the meadows, pastures and public roads in good condition. The Havana Metal Wheel Co., Havana, Ill., has patented a grooved metal tire, the superiority of which is acknowledged. This large factory turns out immense numbers of these grooved wheels, offering the best to all users of farm wagons with any sized skein. Their free catalogue gives much information and will be sent from Havana on request.

THE secret of the almost endless variety of dishes which the skilled chef can produce from a few ingredients, lies in the fact that he utilizes every scrap of material. In his skillful hands left over, and to the average cook, waste food is transformed into the most savory dishes. The ordinary housekeeper lacks the experience of these past masters of the culinary a but modern ingenuity has made the same results possible in every home. The Enterprise food chopper minces fish, meat, fruit or vegetables to any degree of fineness and will make nut butter. The Enterprise Manufacturing Company of Penna., Philadelphia, are the makers of this machine, but they are sold by all hardware and general stores everywhere. "The Enterprising Housekeeper"—a valuable culinary help—containing 200 choice recipes will be sent to any one sending the company four cents in stamps.

DANBURY (CONN.) FAIR.—The thirty-third annual fair and cattle show of the Danbury Agricultural Society was held from October 7 to 12 inclusive. This exhibition has long been the chief fair of western New England, and unlike most local fairs, it grows from year to year. The exhibits and attendance were larger this year than ever before, notwithstanding the partial failure of the fruit and vegetable crops in this part of New England. The main building was filled with vegetables and fruits. A feature of this building was the exhibit of honey by I. J. Stringham, of New York, and G. W. Hatch, of Brookfield, Conn. The implement tent was well filled as usual. The wire fence men were out in full force. The poultry and pet building is one of the chief attractions of the fair. The dog show is considered one of the best in the country. The cattle department was well filled but showed but little if any improvement over previous years. The Hood Farm exhibit of Jersey cattle and Berkshire swine was an important feature of the cattle department. The attendance exceeded all previous records. J. H. G.

Wants, For Sale or Exchange

WANTED—Farmers and Dairymen, $30 to $50, with house or board. Only competent men with good references. The Rural Agency, Durham, N. H.

"I OWN MY HOME."
That's what puts nerve and backbone into a man. We sell them on the easiest terms. More than a hundred to choose from in our Illustrated Real Estate Catalogue Mailed free Write to-day.

FREDERICK LOESER, Personal,
484 Fulton Street, Brooklyn, N. Y.
Real Estate Agents please enclose their card.

GLENN RANCH,
Glenn County, California,
FOR SALE IN SUBDIVISIONS.

This famous and well-known farm, the home of the late Dr. Glenn, "the wheat king," has been surveyed and subdivided. It is offered for sale in any sized government subdivision at remarkably low prices, and in no case, it is believed, exceeding what it is assessed for County and State taxation purposes.
This great ranch of 40,000 acres runs up and down the western bank of the Sacramento River for 15 miles. It is located in a region that has never lacked an ample rainfall, and no irrigation is required.
The river is navigable at all seasons of the year, and freight and trading boats make regular trips.
The closest personal inspection of the land by proposed purchasers is invited. Parties desiring to look at the land should go to Chico, California.
For further particulars and for maps, showing the subdivisions and prices per acre, address personally or by letter,
F. C. LUSK,
Agent of N. D. Rideout, Administrator of the Estate of H. J. Glenn, of Chico, Butte County, California.

Farm and Summer Boarding House Twenty rooms, overlooking city one mile distant. 68 acres—1,000 young fruit trees; grand location. Established business; everything favorable. Will sell on easy terms or rent for term of years to competent responsible tenant. Chance for speculation in villa sites. Address: 383 Bryant St., Buffalo, N.Y.

KNOW THY FARM—Learn its soil, its crop, its needs and its possibilities. Course in Farm Practice. 6 weeks beginning Nov. 11. Course in Poultry Keeping. 6 weeks beginning Jan. 8. One acre of potatoes will pay the cost of both courses.
RHODE ISLAND COLLEGE, Kingston, R. I.

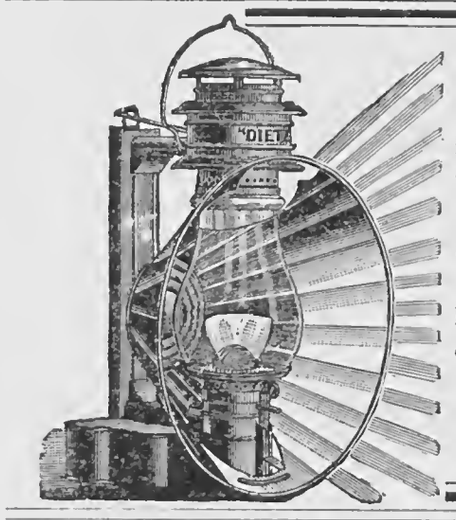
34 & 36 Little 12th St., New York.



Dietz Nos. 30 & 60 Search Lights.

These Lamps are just right for lighting the inside of large barns or cattle sheds. One lamp will thoroughly light up a long row of animals.
The lamps are strongly made, perfectly safe and very economical to use. They burn kerosene (coal oil), and very little of it considering the fine light they give. To introduce, we offer to send one of either size, freight prepaid, at a reduced price.
Send for Free Catalogue.
R. E. Dietz Company,
87 Laight Street, Established 1840; New York.

FEEDS AND FEEDING

NEXT WINTER it will be necessary for our farmers to study the question of stock foods. Corn, the great stock grain, will be high in price, and substitutes must be provided for it. How can these substitutes be found? Only by comparing other and cheaper foods with corn, and knowing beforehand how they will affect the animal. This comparison may be done by studying analyses, but a farmer cannot afford to spend the Winter in experimenting. He must know beforehand what others have found out. He can learn this by studying Prof. W. A. Henry's great book. Feeds and Feeding tells you just what you ought to know about foods and how to feed them. It is full and complete, and easy to read. Price, $2.
Sold by THE RURAL NEW-YORKER, NEW YORK.

PROF. W. A. HENRY'S GREAT BOOK.

BOOK BULLETIN

FOR SALE BY THE RURAL NEW-YORKER.

ANIMAL BREEDING, by Thomas Shaw. A valuable work for all interested in the intricate problems of breeding and rearing live stock; 400 pages. Price, postpaid, $1.50.

409 Pearl St., New York.

MARKET NOTES

STREET ARTISANS.—The traveling knife grinder has been mentioned in this column. Another of these street mechanics often seen about the markets is the saw filer. Almost anyone can hold a knife on a grindstone, but considerable skill is required to sharpen a saw properly, and a greenhorn can easily spoil the tool. His vise is fastened to a light frame which can be carried about and set up where desired. Constant practice makes him an expert at the business, and it is surprising to see the speed with which he can handle the file, even on the fine teeth of meat saws. On saws that require setting he uses a small hammer, hitting every other tooth a light blow; then turning the saw over and going through the same operation on the other side. Another street genius goes about the up-town residence districts. His outfit is more extensive, as he has a horse and covered wagon with tools for doing all kinds of household mending. Leaky pans, broken umbrellas and disabled chairs are speedily put in order at a reasonable price.

POTATOES.—For the past two or three weeks prices have been on a decline. There appears to be no well-grounded reason for believing that the crop is much larger than was expected earlier in the season. The large receipts at present are accounted for by the fact that just now a great many people are digging, and it is a custom with some to sell at digging time, when a fair price is to be had, rather than take the risk of Winter storage. There is considerable said about foreign potatoes, and imports are rather large at present. Buyers, however, do not take hold of these foreign receipts very readily, as size and quality are rather under the average of home-grown stock. In one bag of German potatoes that I examined the tubers would not average one inch in diameter, and some were but little larger than buckshot. Just why such a lot of culls should be shipped such a distance is a mystery. Sweet potatoes are considerably under Irish in price, and are being used to some extent as a substitute.

HONEY.—The yield this year appears to be above the average. It is thought that California will ship nearly 300 cars, about four times last year's output. Prices are slightly lower all around, but the most noticeable reduction is in extracted. There is seldom any excess of the better grades of comb in the New York market, and the price will probably continue high. On account of the difficulty in transporting comb honey any great distance, a large part of the California and West Indian product is extracted and shipped in casks. It is doubtful whether much adulteration is done at the shipping points, as the honey itself is there worth but little more than the adulterants that might be used. The dealers here, however, take it from the casks, melt and doctor it up, and doubtless many of them work in low-grade syrups. Still by buying of responsible dealers it is possible to get a fair quality of extracted honey which is nearly pure. Of course, it cannot be expected that the extracted goods, though entirely pure, will equal in flavor that put up by the bees in air-tight cells, which are not broken until they reach the table of the consumer.

EGG NOTES.—"Yes," said an extensive egg man, "strictly fresh eggs are offered for sale in New York, but in reality very few have any right to that name. For 20 years I lived in the city, and did not know the taste of a really fresh egg until I moved out where I could keep hens myself. Any quantity of eggs that are put into the refrigerators in good condition, especially April receipts, are, after several months' storage, taken out and sold as fresh. Even the best groceries that cater to the fancy trade, handle them, and most people don't know the difference. There is one purpose, however, that they will not do for, and that is poaching. If at a hotel you get a poached egg that does not break and holds its shape well, you may be reasonably sure that it is fresh. Dealers often come to me for eggs that will poach, and I have to refuse them, for I know that even the best of held eggs will not be satisfactory. I have been amused at moderate-priced hotels and restaurants to see a customer ask for poached eggs, and get them fried or scrambled. The waiter is very sorry, but understood the customer to give the order in that way, and in most cases the man will not care to send them back and wait for another order. The trouble was that the cook did not have any eggs that would poach properly."

W. W. H.

FARMERS' NATIONAL CONGRESS.

THE DELEGATES.—The twenty-first annual session of the Farmers' National Congress was held in Sioux Falls, S. D., the first week in October. There has been some criticism of the personnel of this Congress. It has been claimed that it did not fairly represent the farmers' views and interests. No such criticism could fairly be made of the present body. As far as I was able to learn every delegate owned and operated a farm, though some of them had other interests also; but more important is the fact that they were a clear-headed, intelligent, and fair-minded body of men. The different propositions received deliberate consideration. The farmer's position was brought out with great clearness, and his rightful interests were supported in every contention. I have attended farmers' meetings for 20 years. Never in that time did I meet a more representative class of farmers, and never were the agricultural interests more clearly separated from the deceptive contentions of other enterprises.

SUBJECTS OF DISCUSSION.—The important commercial interests discussed were: Ship subsidy, the Nicaragua Canal project, the irrigation of arid lands and oleomargarine. How the friends of the Subsidy scheme got before the Congress no one seemed to know. It was introduced in a paper read by F. B. Thurber, of New York. He had not proceeded far when it was apparent that there was no sympathy with his proposition, and his resolution favoring the scheme was promptly turned down in the committee. It was the first emphatic rebuke to those who would use the influence of the Congress to further ends of the farmers' enemies. The proposition to irrigate the arid lands of the West received less support than I had anticipated. Some of its advocates are willing to concede that the necessity for it does not exist at the present time, and most of them are content for the present if they can prevent the lease or grant of them under any terms to syndicates, who would control them, to the exclusion of actual settlers. The importance of the Nicaragua Canal to the farmers of the Southwest was ably discussed in a paper by Hon. Harvie Jordan, of Monticello, Ga., agricultural editor of the Atlanta Journal. He was entirely familiar with the subject, and the sympathy of his hearers was with him from first to last. His resolution favoring the early construction and control of the Canal by the National Government was promptly approved.

THE OLEO QUESTION.—This developed considerable interest. Chas. V. Knight, of Chicago, opened the subject in a paper entitled "The Truth About Oleo." He told the truth and apparently the whole truth. He showed by letters from manufacturers to dealers that the retailers were incited to violate the law governing its sale, by assurance of unusual profits, and protection in case of prosecution. These letters had guaranteed to imitate any color of butter produced by the farmers in the retailer's neighborhood, and assured them that the oleo, which costs nine cents a pound to manufacture, could then be sold as butter for 25 cents a pound, the then prevailing price of butter. He also showed that the talk about its being the poor man's butter is a cheat, because the poor man always thinks he is getting butter, and pays butter prices for it. The value of the trade to the cotton grower and live stock grower was shown to be insignificant, if indeed it is of any value to them at all. He also showed that taking the statements of oleo makers they could get but 75,000,000 pounds of oleo oil from the animals slaughtered in this country, while they require 166,000,000 pounds for their products as reported. Hence, the 91,000,000 pounds must come from sources which oleo makers are not inclined to reveal. Hon. J. Sterling Morton, ex-Secretary of Agriculture, took up the oleo side. He had a hopeless task. The facts were against him; also the sympathies of the audience, and the strongest champions in the country of honest butter. He rested his case on the plea that cornstalks are about to be utilized for the manufacture of paper, and the assumption that coloring of steer and hog fat was on the same principle as coloring the corn pulp for different tints of paper. The point was far fetched, and the argument was weak. Most of us were disappointed that he had not put up a better argument for oleo. Mr. Knight had apparently laid all the planks in the anti-oleo platform, and as Mr. Morton did nothing to disturb them there seemed nothing left to do; but ex-Gov., Hoard proceeded to nail them down tight, which he did with sledge-hammer blows. The ex-Secretary came forward to disturb them again and a most lively running fire resulted between himself and Messrs. Hoard and Knight. This was interrupted by Hon. Geo. L. Flanders, First Assistant Commissioner of Agriculture of New York State, who turned the platform upside down and clinched the ex-Governor's nails down so tight on Mr. Knight's planks that the attempt to disturb it further was abandoned, and when the resolution came up demanding the early passage of the Grout bill by Congress, there was not a voice raised in opposition to it, and it was voted as the unanimous conclusion of the Farmers' Congress that the fraudulent oleo made in color of butter should be taxed 10 cents per pound, while that not colored need pay only one-fourth of one cent per pound. I was pleased and edified by the position of the western, southern and southwestern farmers on this subject. As soon as they saw that the dairy interests were asking only to legislate the fraud out of oleo, as Mr. Flanders put it, they realized the justice of our contention at once, and expressed their sympathy and assurance of support. "If we cannot carry on our industries," one man said, "without helping to perpetrate a fraud on another agricultural industry, then we should and must take up some new line of production." That seemed to express the feeling of all. It confirmed my faith in the native honesty and abiding justice of the American farmer.

TOPICS TALKED ABOUT.—There were several papers on practical farm subjects that were both interesting and instructive. They embraced "The Present Status of Wool Growing," by J. R. Dodge, Washington, D. C., and "The Rice Industry," by J. B. Foley, Foley, La. Neither of them was able to be present, but their papers were read and both proved interesting subjects for discussion, especially that on rice. The use of rough rice—rice with the hull on—as an egg-producing food for chickens seemed to be a new suggestion to many. Dr. Andrews, of the University of Nebraska, read a scholarly paper on "How to Make the Farmstead Beautiful." It applied particularly to the prairie farms of the West, and Prof. H. W. Campbell, of Kansas, read a most valuable paper on the subject of storing water in the soil, and preserving moisture in the semi-arid lands of the West. All told, it was nothing more or less than the surface cultivation that has been advocated in the East for the last 12 or 15 years, and practiced by many for several years. Prof. Campbell predicts great possibilities in this culture in the West, and I do not think he has over-stated the possibilities. Two papers of great interest were "The American Girl and the Home," by Mrs. Bertha Dahl Laws, of Minnesota, and "The Farm Home Life," by M. F. Greeley, of South Dakota.

THE ELECTION OF OFFICERS.—This was for the ensuing two years, and created considerable interest. Geo. L. Flanders, of New York, was unanimously elected president. The other officers elected are as follows: First vice-president, Col. Harvie Jordan, Georgia; second vice-president, Col. B. Cameron, North Carolina; secretary, John H. Stahl, Illinois; first assistant secretary, E. A. Calahan, New York; second assistant secretary, Geo. M. Whittaker, Massachusetts; third assistant secretary, Joel M. Roberts, Nebraska; treasurer, Dr. J. H. Reynolds, Michigan. Executive committee: Col. B. F. Clayton, Iowa; Col. Wickey, Missouri, and W. L. Ames, Wisconsin. The people of Sioux Falls gave us a cordial welcome. The propriety, simplicity and effect of the decorations in the auditorium surpassed anything of the kind I ever saw. It was all accomplished by use of the grains, grasses and fruits that grew on the farms in the vicinity. The accommodations of the Cataract Hotel were ample, and the proprietor did everything to make his guests comfortable. I know no eastern hotel that sets a table with such an abundance of fresh, well-cooked food at equal rates. The local committee, the people of the town, and the local farmers all showed a kindly interest in the visitors, and succeeded in making them feel welcome. It is true that one of the local committee lost his balance and became offensively personal in a debate on the election of an officer, but the good sense and forbearance of the one attacked made this a trivial incident, and the offender was promptly rebuked by a vote of nearly two to one in the defeat of his candidate, a man who, under other circumstances, would have received a unanimous vote. We left Sioux Falls with admiration for the sturdy northwestern farmers, with a kindly feeling for the cordial people and gratitude for their hospitality.

J. J. D.

GOOD POTATOES.—Last Spring I wrote you asking your advice in regard to sprouting seed potatoes, etc. In my letter I suggested my purpose to try the Cornell method of culture, and in your kind answer you said you would be glad to know how it came out. I have just harvested over 200 bushels (early varieties) from not quite an acre. In view of the fact that my neighbor's early potatoes were almost a total failure this year, I think mine did very well.

Live Stock and Dairy

DAIRY AND FARM NOTES.

CHEESE NOTES.—Central and northern New York has just experienced a loss of $25,000 to $30,000 due cheese factory patrons for a single shipment, or two in some cases, by the failure of R. McAdam & Sons. The main cause primarily is said to be due to gambling by one Higham, the sales agent and confidential clerk for the firm, who resided in New York. The loss is so widely spread that with one exception no great hardship will be felt. I mention the fact in these notes on account of the terms of settlement which have been accepted by a majority of the creditors so reported, of 25 cents on the dollar, and no effort made to punish Higham. To permit an agent of a firm to steal the money of hard-working farmers, and be permitted by the firm itself to go scot free, should receive some attention, and cheese salesmen should see to it that the fellow is punished. The custom in northern and central New York is to buy, on the regular sales days, Saturday and Monday, and pay the following sales day, or sometimes two weeks hence. This permits the large buyers to carry several thousand dollars of farmers' money. Really I do not see how an immediate cash payment system can be easily inaugurated. The whole business world is built upon confidence. Business soon stagnates when there is so little confidence that regular 10, 20, or 30-day credits are not given. But when a trusted agent goes wrong under this system, punishment should follow as a warning to others. The only safety to our cheese producers, in fact, to all wholesalers of dairy products is to get their pay, and that promptly. The prices paid for these staple goods is always upon a close margin over cost of production, and the loss of a single week's money means the profit of perhaps a half year's business. I am not speaking of this instance because we are losers by the failure; we had no dealings with the firm.

THE HOME TRADE.—This leads to a thought in regard to selling butter and cheese. We have sold to every class of trade, from the private family who bought as small a cheese as five pounds all along the list, grocer, wholesale grocer, jobber, exporter and the local dealers who buy regularly. The home trade is coming to be the most reliable, and all things considered, the wholesale grocer or a jobber who stands in the same relation to the trade is the most satisfactory customer. It would seem that a trade direct with the retailer should be a higher-priced trade. Often it is, but they are not as prompt payers unless one can meet them from week to week. We furnish in our local towns to those dealers who are prompt, and all goes well. The private family trade has not proven satisfactory as a whole—people do not like to write for stuff; they seem to prefer to buy of some one they can meet, and the cost of transportation on small quantities quite handicaps the trade. Express charges are uniformly one cent a pound gross weight, making 1¼ cent on the net weight of the package, and freight charges on less than 100 pounds are about the same as express. We have therefore sought out and worked for a reliable class of dealers who sell to the retailer, and all seems to work well. Our arrangements are such that we manufacture almost wholly upon orders. When the cheeses are ready for shipment we know just where they are to go.

SILO NOTES.—We are to-day (October 5) completing the silo filling. Excepting the mud, which has caused some trouble with the harvester, we have housed about 600 tons with the least friction and annoyance in my experience. I feel that corn handling has reached nearly perfection. A heavy pair of horses and a McCormick harvester, with a careful man to run it, has done work that it would hardly seem possible could be done by a machine. Wet land and a hard wind tangled the corn in all shapes, yet this machine would, human-like, take every stalk not absolutely flat on the ground, straighten it up, and tie it. Men quite object to handling unbound corn, and I don't blame them. Another year's experience with a blower adds to my satisfaction. We tried a Canadian machine last year which worked well. This year we bought in conjunction with two neighbors a No. L 14 Blizzard. While I have no desire to give any machine free advertising, this certainly does not need it, but the work has been so completely and perfectly done that I feel like speaking of it. The corn is almost cut to a pulp, every kernel cut from the cob, mixed with stalk and leaf, and elevated 40 feet without a half bushel on the ground. My appreciation of the blower is shown by letting a good chain elevator machine stand idle. I have just halted between two opinions; 50 tons of corn was to remain after filling one silo. Should we stack it, pile it, shock it, or what? We had a small bay which was cleaned out, and the corn, as I write, is going into it. I shall level it down, keep the top and edges wet, and expect to have more net food value than by any other means. It is so finely cut that I feel sure it will pack and keep. If it does not I will report the result. We tried a quantity several years ago in this way, but it was immediately fed out. This will not be fed for a month or six weeks. H. E. COOK.

THE HOLSTEIN COW MARGARET LINCOLN 2D DEKOL. FIG. 326.

A GOOD HOLSTEIN COW.

Margaret Lincoln 2d DeKol, the cow shown at Fig. 326, is owned by Mr. Goodell, president of the Goodell Manufacturing Company, Antrim, N. H.; established her first record the week she was three years old by producing 16 pounds 11 ounces of butter. At the New England fair at Portland, Me., 1896, she won first prize for a three-year-old and at the last New England fair, 1900, she was a leading member of the herd, winning the first prize at the same place, also winning first prize in the 24-hour butter test at the same time. Mr. Goodell breeds Holsteins as a pastime, but like many other good business men, he has seen the necessity for good blood and good performance, and has thus secured some fine specimens of the breed. Just now interest in the Holsteins is reviving. At the Pan-American dairy test the black-and-white cattle were for a long time behind the Guernseys, Jerseys and Ayrshires in actual profit from butter. Now, at the wind-up, they are gaining, as the following report will show:

"In the Model Dairy at the Pan-American Exposition one of the noticeable features is the manner in which the Holsteins have maintained their large flow of milk. They have, in fact, shown the least inclination to decrease as the season advances of any breed in the stable. A study of the rations fed to these cows will in a measure account for these results. At the time green feed was first furnished the herdsman in charge of these cattle cut hay entirely out of his rations and also reduced very materially his grain feed, making the bulk of the Holstein rations from green feed. Now, when the time has come that no green feed is given and dependence must be had on silage, by returning to the amount of grain that he fed in the beginning of the season, he has been able not only to keep up the flow of milk, but to advance his herd above the position that they occupied during the Summer, thus again demonstrating the fact that excessive grain feeding for a long period is not always conducive to profit or production, particularly in combination with green forage crops.

HORSE COLIC,

Distemper, Founder, Pneumonia, etc., as well as all forms of Lameness, Contracted Cord, Curb, Splint, etc., are instantly relieved, and invariably cured by the use of

Tuttle's Elixir.

Satisfaction guaranteed or money refunded. Used and endorsed by the Adams Express Company. Used by leading breeders and turfmen everywhere. Has saved and cured many valuable horses. May do likewise for you.

SOMETHING ABOUT AYRSHIRES.

We have a dairy about one mile from Catawissa, Pa. We have mostly Jersey and Holstein cattle. On reading your account of the Pan-American dairy test I notice that the Ayshires stand well in both butter test and also in milk. Would you advise me to get a couple of those cows in my herd? Would any of the readers of THE R. N.-Y. give me some information on the subject? Where could I get some young stock? Are they good milkers? There are no cattle of the Ayrshire breed in this section. W. J. E.

In southwestern Scotland is a county of much prominence known as Ayrshire, and here this breed of cattle has flourished for a century or more. Its origin is more or less obscure, but probably Short-horn and Dutch cattle assisted in the development and improvement. In Ayrshire to-day this is about the only breed, and here one sees many magnificent specimens. It has long been the opinion of the writer that the Ayrshire is one of the most uniform, well-developed dairy breeds of cattle, and this is mainly due to the persistent and consistent policy of the Scotch to produce a medium-sized type with the desirable points well developed. A standard weight for the Ayrshire cow of mature form in Great Britain and the United States and Canada is 1,000 pounds, while the males range from 1,200 to 1,500 pounds or larger. The colors are brown and white, usually more or less mixed in varying degrees. In Canada white I judge to be the most fashionable color, while in the United States the more sober brown with less white is most usual. In Scotland brown is also very prevalent, generally speaking, however, with some white.

The best type of Ayrshire is a broad-backed, deep-bodied, short-legged sort, with an udder of superior shape, being well extended in front, and carried up behind with a good curve. According to my observation no breed in America to-day will show more high-class udders, if as many, as will the Ayrshire. This perhaps is due to the fact that the breed is not so indiscriminately bred as are some breeds of wide distribution. The Ayrshire in America is usually kept in Canada and the northeastern United States, there being but few in the West. It is a breed of hardy character, and seems well suited to the more rugged portions of our country. This not a general-purpose breed, but is rather essentially a dairy type, capable of considerable milk production. A record of 7,000 pounds of milk a year is quite common, and many of this breed have produced 9,000 and 10,000 pounds. Princess Aldine produced 13,400 pounds, which is the largest Ayrshire milk record to my knowledge. In 1888, Mr. J. D. W. French published a catalogue of his herd, in which he gave some records, covering 14 years. During the year 1885 he milked 20 cows, and their average yield was 6,037 pounds. The milk of this breed is of average richness, containing about 3½ to four per cent of fat. The Vermont Experiment Station has for years kept a dairy herd, in which Ayrshires have a prominent place, and in their 1897-98 report, they make the following statement: "As in past years, the Ayrshires rank high in yield and in economy of production of milk, and relatively low in economy of production of butter." In the Model Dairy at the Pan-American Exposition, for the week ending September 24, the total milk yield for the different Ayrshire cows was in round numbers, 245, 204, 189, 248, and 216 pounds, and the fat per cent in the milk averaged four per cent; 3.5, 4.2, 3.85 and four for the yields given above, in the order given. The Short-horns in the test gave about 25 pounds less than the Ayrshires, while the total butter fat per cent was almost identical in amount. For general dairy purposes the breed ranks high, and will undoubtedly give back satisfactory returns for its keep and care. Its hardiness, easy-keeping qualities and ability to produce milk abundantly commend it to dairymen. So far as I know, it has never been ranked as a general-purpose breed, but the cows would be more salable as a rule to the butcher than would Jerseys, being of somewhat more scale and rather capable of more flesh production. Ayrshire veal should also sell at a fair price. Milk of this breed is of high enough grade to command a place in the city milk trade.

The person soliciting information on this subject, further says: "Would you advise me to get a couple of these cattle in my herd." The writer believes in stability of purpose. The proposition now is, will it be advisable to add Ayrshire blood to a herd at present containing both Jersey and Holstein individuals? The two latter breeds represent rather extremes in dairy type. The Ayrshire is a sort of middle ground. Perhaps this would be a good breed to compromise on. Yet the main thing to be sought for, is profitable production. I have no hesitation in saying that I believe that good specimens of either one of these breeds will pay a satisfactory profit on the investment with good management. An Ayrshire bull on Jersey cows will add somewhat to the Jersey size, and perhaps add to the milk yield, but the butter per cent in the milk would no doubt be lessened. Ayrshires on Holsteins would be likely to reduce the milk yield considerably, add no doubt to the quality of the milk, and give a smaller type of cattle. Really the wisest plan in my judgment, would be to stick to one breed and have uniformity in type and character and results. This will pay best in the end, no matter which breed is selected. There is an American Ayrshire Breeders' Association, and a letter to C. M. Winslow, the secretary, at Brandon, Vt., will no doubt secure further Ayrshire literature. The person who requested this communication lives in Pennsylvania, and asks whether "there are no cattle of the Ayrshire breed in this section." There are Ayrshire breeders in Pennsylvania, and if a letter is sent Mr. Winslow on this subject, he will be likely to forward some addresses of Pennsylvania breeders. C. S. PLUMB.

VALUE OF A TON OF SILAGE.

Last year in THE R. N.-Y. for December 8 was an article on Value of Hay and Silage, by G. E. Scott, which, if not erroneous in some of its statements, is certainly very ambiguous and misleading. The following analysis of feed stuffs was given:

	Protein.	Carbohydrates.	Fat.
Corn silage	1.7	11.1	.8
Timothy hay	5.9	45.0	2.5
Clover hay	11.5	33.1	3.3
Green clover	4.4	13.5	1.1

Mr. Scott has taken the percentage of protein, carbohydrates and fat from the chemist's analysis, but as Prof. Henry says: "The value of gold ore is not rated by the total amount of gold contained, but rather by that portion which can be recovered by practical processes; so with our feeds, only those portions which can be digested and utilized by the animal are really valuable." So if Mr. Scott will compare corn silage and hay on the basis of the *digestible* protein they contain he will arrive at more definite results. The percentage of *digestible* nutrients in the feed stuffs named is as follows:

	Protein.	Carbohydrates.	Fat.
Corn silage	1.2	11.8	.6
Timothy hay	3.0	43.9	1.2
Clover hay	6.5	34.9	1.6
Green clover	2.9	14.1	.7

As the carbohydrates (fat makers) are always in excess of our needs in all home-grown feed stuffs, it follows that the amount of protein in any given feed does determine its comparative value for feeding dairy cows. In order to determine the money value of corn silage as compared with clover hay when the price of hay is given it is only necessary to put the proposition in the form of an equation in ratio and proportion as follows: 6.5: $10:: 1.2: $3.38½. That is, the percentage of protein in clover hay is to the price to clover hay as the percentage of protein in corn silage is to the required price. Now the product of the means is equal to the product of the extremes, and in order to ascertain one term of the equation when the other three are given, we multiply the means together and divide the product by the other extreme, or vice versa, as the case may be. By applying this rule we find that if clover hay is worth $10 per ton corn silage is worth $3.38½ per ton on the basis of the digestible protein contained in each. By making an equation with Timothy hay in the same manner we have the following: Three per cent protein in Timothy is to its price, $10, as 1.2 per cent protein in silage is to $4. Assuming that Timothy hay is worth the same price per ton, we find that corn silage has a comparative value of $4. With us the market price of clover hay is about $8 per ton, and an equation would read as follows: 6.5 per cent protein in clover hay is to $8 as 1.2 per cent protein in silage is to $1.48, showing that corn silage is worth $1.48 per ton as compared with clover hay at $8 per ton.

At $10 per ton for clover hay three tons of corn silage are just about equal to one ton of clover hay on the basis of the digestible protein they contain. I think Mr. Scott is in error when he says that a ration of 20 pounds of clover hay would furnish 2¾ pounds of protein per day. Figured on the total amount of crude protein contained in 20 pounds clover hay, it would be less than two pounds, and of *digestible* protein only 1 1-10 pound. Perhaps Mr. Scott figured on 20 pounds of absolutely dry hay, which would be rather bulky for a practical ration. The 20 pounds of clover hay would only contain 16.94 pounds of absolutely dry matter, and that is what we have to base our calculations on.

Michigan. C. D. WOODBURY.

Drying Off a Cow.

We want information about cows going dry. We have a young Holstein due with her second calf shortly. She is giving five quarts now per day, and it looks as if she might give milk nearly if not quite up to calving, unless we take pains to dry her off. We have been told by several that she ought to go dry six weeks or two months. Is that the right way? She has two quarts of bran and about a pint of meal a day, with all the hay she will eat.

READER.

It has been my usual custom to milk a dairy heifer from time of first calving up to the second calving if may be. The purpose in this is to establish a retentive or strong milking habit if possible during the first period of lactation and in after milking periods. This is also in accordance with the policy of many breeders with whom I have talked. After having her second calf and before the birth of the third, it is my desire that the cow shall go dry for eight weeks or so. She will during this period have a resting spell, and also provide better for the forthcoming calf. During this dry period but very little grain need be fed, if good pasture or hay is plentiful, and of the concentrated feed, bran with a little oil meal answers the purpose best. When not on pasture, then silage or roots offer a most desirable food for the pregnant cow. Two quarts of bran and a pint of meal daily certainly would not be misspent on a dry cow of high class soon to come fresh. Bran is especially recommended, as it aids in keeping the bowels open and active, and promotes a vigorous condition of the system. C. S. PLUMB.

STARTING THE HENS.

The first thing in this part of the country, if you want pullets to lay in the Fall, is to begin to hatch the chicks so that they will mature before the cold weather comes on. I find that a chick hatched four weeks too late in the Spring is from 12 to 15 weeks behind when it becomes Winter. As the cold weather approaches in the Fall I begin to feed a little more generously. I do not believe in feeding stimulants to poultry except meat meal, oyster shells and grain. If a person had but a few hens, perhaps nothing would be better than ground raw bone and meat, but for a large number of hens (if you have to turn the crank yourself) the prepared meat meal comes in quite handy. I know of no other way to get 200 eggs from a 150-egg hen, poultry paper advertisements to the contrary, notwithstanding. V. E. H.

Lakeport, N. H.

I feed my pullets so as to give all the growth I can while young. I feed cracked corn, wetted with sour milk, for the first three months; after that I keep corn before them (or buckwheat) all the time. If hatched in April, by November they are generally ready to lay. For Winter, my feed in the morning is a wheat mash with some of the prepared poultry foods mixed with it, and also some oats or buckwheat at night. In cold weather I always feed whole corn, also keep plenty of warm water before them. I am not a poultry fancier, but with this plain method of care from the start my pullets and old hens lay well. After they begin to lay, they keep it up most of the time until they are dressed for the table, as I kill off all the yearling hens as soon as the pullets begin to lay. I also keep oyster shells ground before my poultry at all times of the year. G. W. H.

VOL. LX. No. 2700. NEW YORK, OCTOBER 26, 1901. $1 PER YEAR.

A REVIEW OF "CHEMICALS AND CLOVER."

Is Stable Manure Absolutely Necessary?

PART II.

We repeat part of the question that was asked last week with further comments on the plan outlined:

This matter interests us very much, because we own large areas of naturally good land which are too far removed from our barns and stock to think of carrying stable manure to them—much better land in fact than on the home farm, and we would be glad to see some of it cultivated. We do not feel it practicable to put up barns one, two and three miles from home just to make manure for those lands. This year we have put in a number of acres of corn on one of these isolated tracts, and used simply acid phosphate and muriate of potash; also potatoes with chemicals along. All the crops are looking fine—all on land which has for the most part been used for pasturage and probably not plowed in the past 15 or 20 years. Our programme is to sow rye or wheat this Fall on all this ground, stock with clover in Spring, and cut rye or wheat for hay or solling, the same as we have done this year on last year's corn ground, but the question in our mind is, can we keep this thing up and maintain the productiveness of the land or improve it? A. G. T.

Willimantic, Conn.

We consider that experience has amply demonstrated that this plan is entirely practical. In many situations at the East it is the only sensible plan for working distant fields. Some of these fields are long distances from barns, and are higher than the home place, with poor roads between. On our own farm we have fields at some distance over a steep hill. Our horses can haul nearly twice as much corn or hay from these fields down the hill as they can of manure up the hill. There is every argument why manure should, if possible, be hauled to the fields reasonably near the barn.

There are few more exacting crops than well-grown fruit. Orchards demand the most skillful feeding, for they must produce yearly crops of fruit, and also make a fair growth of wood. It will be easy to find hundreds of fine orchards that have not received an ounce of stable manure for years. These orchards are cultivated through the Spring and early Summer and well fed with chemical fertilizers. When the crop is fairly well matured a "cover" crop like cow peas, clover, vetch or rye is sown in the orchard, and holds the ground through the Fall and Winter. It is plowed under the following Spring, when the process is repeated. This goes on year after year with full success, the chemicals supplying most of the plant food, and the cover crops providing the humus or vegetable matter. If this can be done with an exacting crop like fruit, who can doubt that it will also prove successful with crops like corn, potatoes, grain and clover, provided you supply the plant food that is needed?

We do not believe the plan you have outlined will succeed for long, because you are not using any nitrogen. We understand that you intend to use only muriate of potash and acid phosphate on your corn, evidently expecting the clover, which is to follow, to supply nitrogen. We believe you will be disappointed in this, and that these outlying fields will never prove fully satisfactory until at least fair dressings of nitrogen are used. In the Mississippi Valley, on some of the heavy clay lands, good crops of wheat, corn and clover are grown by the use of dissolved phosphate rock and small quantities of potash. Such soils are naturally strong, and well adapted to the growth of clover. The phosphate supplies the element most needed on clays, and also renders more or less of the potash available, and a large growth of clover results. Some of these results with acid rock alone have been published as though they were suited for general application on all soils when, really, they are true only of the heavy clays. The soils of New England are deficient in potash and nitrogen, and have been in cultivation nearly 100 years longer than the western soils which require only acid phosphate and clover. On some of these distant fields corn is the best crop that can be grown. Haymaking so far from home is not always satisfactory. We have been able to grow good crops of corn year after year by sowing a mixture of rye and Crimson clover at the last working of the corn. This will make a good growth through Fall and Winter, and may be plowed under the following Spring for another crop of corn. The stalks and grain may be hauled home through the Winter, and if a corn harvester is used the job of cutting is greatly simplified. When the rye and Crimson clover are plowed under we would always use a corn fertilizer containing at least 2½ per cent of nitrogen. The general proposition that average New England soils can be made to produce good forage crops, and slowly improve by the use of chemical fertilizers and "catch crops" with roots and stubble of grain and clover, is sound enough, but you cannot do it satisfactorily without using a fair amount of nitrogen, and occasionally plowing in a full crop instead of cutting it for hay. H. W. C.

WHOLESALE BUSINESS IN FARMING.

The picture on this first page, Fig. 327, shows how land is worked in some sections of California. It is taken from a bulletin on wheat growing, just issued by the Department of Agriculture. Here we have an immense traction engine, three sections of disks (24 in all) behind it, and thus covering an enormous amount of land in a working day. This soil is chopped and fitted for wheat. A combined broadcaster and harrow follows, so that in a single day two men may sow more wheat than an eastern farmer with small fields and single team tools could handle in a month. Of course the land must be level and smooth to enable these traction engines to operate. No one expects that the 1,000-acre field will be as carefully fitted as the 15-acre field on the 90-acre eastern farm. Along the river near Stockton, Cal., are islands which were once large flats covered with water and weeds. They have been drained and reclaimed for wheat growing. The soil is soft and full of cracks, so that horses cannot be used. Hence, great traction engines, like the one shown in the picture, with the tires broadened out into great drums, are used for plowing, seeding, and harvesting. Does not this wonderful system of farming mean death or bankruptcy to the eastern farm? Is it possible to compete with steam power on level land? Perhaps the following notes of conversation from C. E. Chapman will give the other side. Just now there is much discussion as to whether

REPLOWING WITH STEAM OUTFIT IN THE GREAT VALLEY OF CALIFORNIA. FIG. 327.

a farmer should go East or West if he desires to change. The cheap eastern lands are closer to markets, while the richer western lands cost more.

Eastern and Western Farming Compared.

Just as we passed Caledonia, N. Y., a tired-faced, middle-aged man looked eagerly from the car window and remarked: "That looks like home." "Where is that?" said I. "Out in Iowa." We were passing through a level section, fresh and green; large, broad level fields—a beautiful picture, but *small*, as I told him. "When I passed through your country, I grew so tired of the monotony; one level field after another for hours, that I would not look out of the window. There was no *view*, no hills to curve around, bringing new, unexpected scenery to rest the eye, Your country is *too flat*." My reply seemed to amuse him, as he replied:

"It gives me the backache to think of climbing those hills; to work among the stone; to do business on a small scale. You are not in it."

"No, not in the mud, as some of your people are most of the year. You would like our stone to harden your roadbed. Crushed stone makes a good bed for wagons, as well as for railroads. We made that last mile in 48 seconds, and you can hardly feel a jar."

We compared notes, and I found that land would cost from $10 to $30 per acre more there than here; that corn and oats were the principal money crops, and yielded but little if any more per acre than mine does; that the price for grain is less with him, and he has farther to haul to the car than the average New Yorker. The cost of labor is greater in his State than in mine, and there is no nearby good market for the thousand and one things—incidentals—which aid us, like a bushel of apples, pears, potatoes, eggs, small pigs, etc.

"Now, why should any young, poor man go West to engage in farming?" I asked.

"Because he can accomplish so much more work on our level farms, with our machinery and soil."

"What good to accomplish more work if you do not get pay for it? You say you get 40 bushels of oats per acre, and 25 to 30 cents per bushel. Can you make any money on high-priced land at those figures?"

"No! I guess not. We have just kept even for a number of years."

Last Winter I was associated at our institutes for several weeks with a man from Minnesota, and the number of our small towns, villages and cities was a constant source of surprise to him. "Why," said he, "you have a market for everything at every four corners. You have a wonderful and I fear unappreciated opportunity to make every moment valuable, growing something outside of the main crops." Right here in central New York is as good a place for a pleasant and profitable home as in any Western State, be you either rich or poor. C. E. C.

High-Priced Land in Iowa.

Recent letters in THE R. N.-Y. concerning comparative prices of farm lands have been interesting, though it is disappointing to note only one from Iowa, and that a very conservative statement of the situation here. As a matter of fact, it is very strong. Speaking roughly, prices have appreciated here at about the rate they have depreciated in the East, as indicated by the general tone of your correspondence. This improvement is, however, of recent date, occurring mainly within the last two years. For example: A friend who bought an 80-acre farm in January, 1900, at $60 per acre, has lately refused $85, and would not care to sell at $100. That is a typical case of the better class. Good farms in central Iowa can no longer be bought at $50 per acre. Sales generally are at $60 to $80, while many are held and some sold at $100 and even higher. The increase being mostly contemporary with better prices for corn and its chief products, beef and pork, indicates the principal cause. It seems, too, that there is a fairly well defined, though not clearly explainable, wave of comparatively high prices for farm lands that has slowly but steadily crept west, like the center of population, and is now far outreaching that and approaching flood tide in Iowa. The good qualities of adjoining States but emphasize the fact that Iowa is the center of the best—the agricultural hub of the United States. "Nothing succeeds like success," and there are, probably, more farms than ever before held as investments by men who do not themselves work the land. In some respects this is unfortunate, for many of our most thrifty farmers—the enterprising young fellows who want to gain homes—are leaving for the lower-priced lands of Dakota and Oklahoma. Personally, I should like to raise Winter wheat (if it would bring at least 20 cents per bushel more than it has averaged for several years) and your eastern theories about "home markets" and "finished products" sound well, but in 50-cent corn and six-cent hogs, we are "confronted with a condition" that makes their production the most fashionable occupation in this section of country. If it continues a year or two, first-class Iowa land will easily bring $100 per acre, and the farmers may be seen with their overalls creased and turned up at the ankles. W.

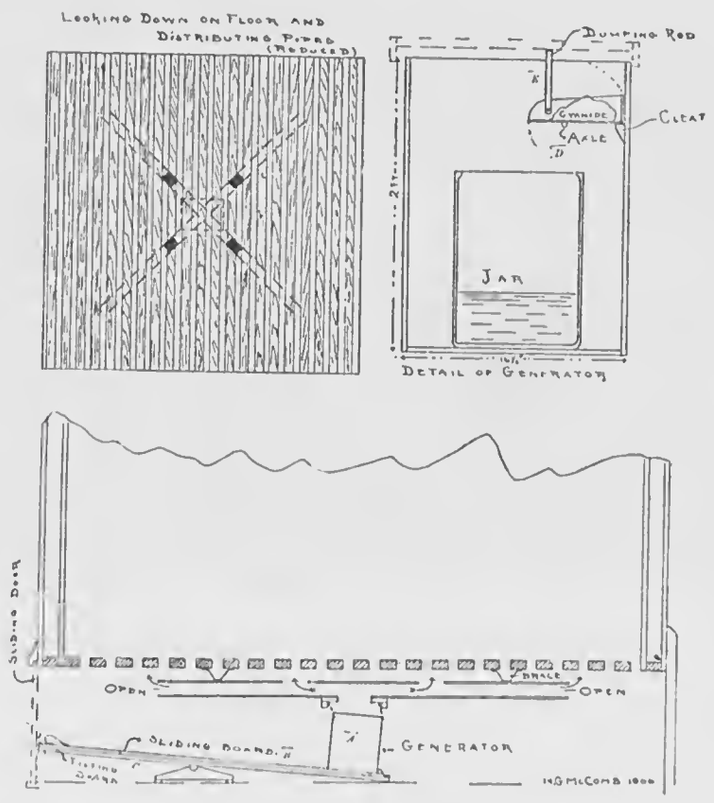
Marshalltown, Iowa.

BRIEF NOTES FROM THE FARM.

Not long ago I chanced to meet two dairy farmers residing in the same town, both of whom have made a success of dairying. They have, however, worked along quite different lines. One buys all his cows, keeping them a year or two, or in some instances longer, then selling off to replace them with others.

WICKSON PLUM. FIG. 328. SEE RURALISMS, PAGE 726

He changes whenever he thinks he can get a cow that will pay him better than the one he has. The other farmer hasn't bought a cow since the first dozen or so that he began with, about 35 years ago. So far as I know neither method has any advantage over the other, only as the individuals differ. One of these men is a good buyer, and a good judge of cows. He is well posted regarding prices, and localities where he can buy and where he can sell to advantage. He does best to buy, and never lets a thoroughly good cow escape him if it is for sale at any reasonable price. The other farmer understands breeding, and has a pedigreed sire for his herd. His dairy has steadily improved under careful selection. No doubt each of these two men manages the best way for himself. The one who buys his cows gets good ones, and gets them rather cheaper than the other man gets his, but the other man probably could not get them that way so well. He raises his at a trifle more cost. He may or may not get better ones. It depends upon the man, his preferences and characteristics. No one can prescribe positively for another. One man produces



APPARATUS FOR FUMIGATING WITH HYDROCYANIC ACID GAS. FIG. 329.

Winter milk, and by so doing gets the largest returns per cow of any man who patronizes the creamery. He makes money by his method, although he buys a good deal of grain. The other man produces about one-third as much milk in Winter as in Summer, and makes the year's milk at a less cost, buying less grain, and gets less for his milk. He makes a profit. There is no way that is best for everybody, much depends upon the cost of land, the price of labor and the price of milk.

As the cool October nights come on we keep the cows over night in the stable, feeding barley and peas and fodder corn. Sometimes we keep them up earlier in the season, and some neighbors have done so this year. Of course, more manure is saved to apply when it is wanted, but so long as the cows can get a good bite in the fields they will give more milk on the choice pasture grasses containing considerable protein, than they will when fed the more carbonaceous fodder corn. The corn must be had for most seasons though, because the pasture grasses become too dry and too scarce for a full feed. No crop can take the place of corn in such cases, at least in respect to quantity. We always feed a good deal of sowed corn, but really it needs a little bran to go with it.

To-day, on a farm of some note, I found one item of good management carried out better than I ever saw it elsewhere. One man was at work, as he evidently had been some days before, with paint and brush, painting everything that can be benefited by the application of a coat of paint. Wagons and sleighs and sleds, plows, mowing machines and other implements, and even whiffletrees and neck yoke came in for a share. It looks so much better to have them painted; besides, it pays, for the tools last so much longer. Then, too, these beautiful October days form a very good time to do the work, not so cold as to hinder the workman at all, and work not crowding so much as to make it unwise to leave it for this purpose. Yes, let's apply the paint, and while about it make any needed repairs, preparatory for next season's work.

This season, the growth in our meadows since haying has been quite rapid. Many are turning their cows into the meadows, and are getting a nice flow of milk as the result. The question as to the wisdom of this course has been answered both ways. We find, usually, that feeding off a part of a rank growth does not unfavorably affect our meadows, or at least we think it does not. One year we left a fine growth of rowen, and as a result got almost nothing the following year. In that instance mice spoiled the field. A lot by the side of it that was mowed did nicely the next year. Where the growth is tall enough to allow cutting a good swath, mowing seems to be the best plan, but usually there is only a part that can be mowed anyway. If that is mowed and cattle are then turned into the field the place that was mowed starts up fresh, and the cattle are likely to eat it too close. Usually this is not an advisable course. Another difficulty is on a new seeded piece. There, too, is where cows are likely to stay the greater portion of the time. In other words cows will eat too closely just the places that you want them to leave, and so long as they can get a fair bite elsewhere, they do not care for the places where the growth is such that you want it eaten off. Our practice is to turn into the meadows where the growth is good, and there is not too much new seeded that will be injured. Sometimes we find it advisable to string two or three strands of wire around a newly-seeded field, and let the cows run over the remainder. A light sprinkling of stable manure over a field needing protection will suffice usually, and is most excellent in its results. We do not let the cows stay long enough in any one field to eat it down close to the ground.

I have been watching quite closely a small lot of beets this Summer. It comprises 35 square rods of land. As I was driving past yesterday I saw the owner at work harvesting. He has an even 100 bushels, or three tons of roots. This is at the rate of 13 5-7 tons per acre. Sugar beets are worth $5 per ton, when sold to sugar makers, and many think them worth as much to feed. These beets are "half sugars," but I do not know whether that makes them more or less valuable for feeding. They will be fed this Winter to a herd of new milch cows. Mr. Pearsall, the owner, says six days' work is all he has done on the lot, where he gets the three tons of roots. There is the use of the land, the seed and fertilizer besides. H. H. L.

REMEDIES FOR THE ENGLISH SPARROWS.

Last year I was much annoyed by English sparrows. Not only did they eat more food than the fowls, but aligned themselves on the fence at every meal time waiting for the feast. As I am somewhat averse to shooting them, I used only gentle means to prevent their depredations, but they seemed to have found a harboring place with me, and multiplied until there were hundreds. They also consumed grain and seeds from the neighbors' farms and soiled the ground under my trees. Finally, they took possession of my porch. This nuisance has continued for several years. At last I noticed that their numbers were diminishing, and I endeavored to learn the cause, being very much puzzled until I saw a small hawk sitting near a tree containing sparrows. At night a little screech owl seemed also to have considerable business near my house.

Only the large hawks are destructive in the poultry yard. In Winter there are no very small chicks on farms. Hawks and owls destroy mice, and the owl consumes night-flying moths, while both the owl and hawk are partial to grasshoppers, and all kinds of insects. While farmers are holding conventions to consider how to destroy the sparrow they are also keeping the hawk and owl at a distance with the shotgun. The sparrow remains near the dwellings, and the way to get rid of them is to give his natural enemies the same rights and privileges. I never shoot a hawk or owl, yet I have never lost a chick by hawks. I keep my fowls closed at night, hence the owl cannot get at them. Instead of shooting these friends I am even willing to share a portion of my poultry with them if they will continue the work of annihilating the sparrows, which consume more of my produce and foods than the fowls. P. H. JACOBS.

FERTILITY AND FROST.

Resistant Effect of Vigorous Growth.

In a recent visit to a large nursery I saw two most striking examples of the effect of vigorous vegetable growth in counteracting frost. Part of a field of cow peas, planted as a cover crop, was green and making some growth, while in the other part but few living plants could be seen, nearly all having been killed by a recent heavy frost. The nurseryman told me that the space covered by the green peas had been heavily manured just before planting time, and that the rest of the field had received no enrichment. The second illustration was even more marked. A large block of young apples, two years from the graft, had on one side several acres of rather weak-growing trees; on these there were but few fresh green leaves, nearly all having been browned by frost. On the remainder of the block the trees had made a good Summer growth and were full of vigor; the foliage of these was green and almost unharmed, especially on the strong-growing upper shoots. In this case the less vigorous plants were on land from which trees had been removed but two years previous, and which had not recovered from the depletion of fertility by this former crop. The more fertile part had gone through the usual nurseryman's rotation of several years without trees. In both instances the land was flat; where elevation or air drainage could have had no effect, and where there were no forests, or water, or changes in soil, or other apparent factors, that could have brought about the differences mentioned.

A number of similar examples along the same line which have come under my observation could be given. I call to mind a field of celery at Kalamazoo in which soil fertility seemed to offset a hard frost. In a forestry experiment in Utah I noticed two successive seasons that the upper leaves and shoots, which we usually speak of as "tender tips," and which, of course, are best nourished and most vigorous, kept green after the lower leaves were badly frostbitten. This test was a good one, as there were 20 acres of young trees of many varieties growing under uniform conditions. In fields of grain we often see green oases late in the season—always the richest soil. The vegetation in barnyards, and dooryards, spots of great fertility, keeps green until snow. Winterkilling of grains is most common on poor soils. Vitality in plants varies with the fertility of the soil. Not only are heat, drought and disease counteracted by increased vitality through good nourishment, but frost as well, and to a considerable extent, a fact not fully appreciated, and one which could be made of no little service in our climate.

Michigan Agricultural College.

THE FARM CAT.

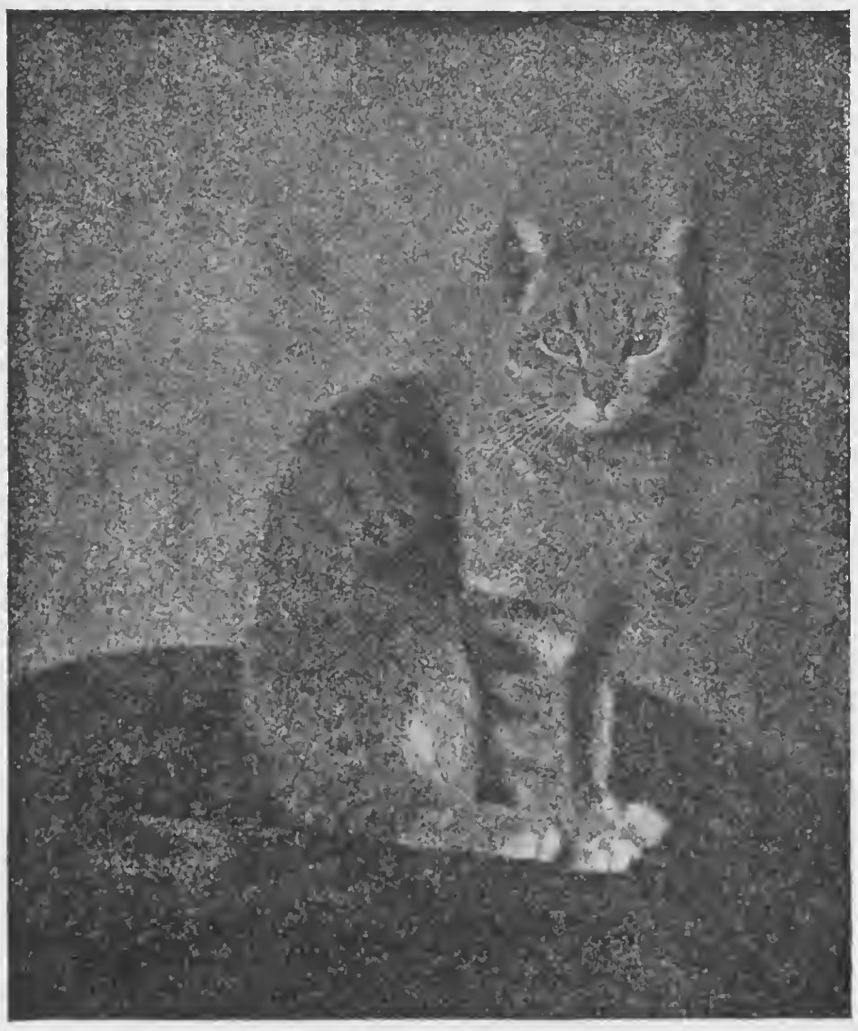
Very often cats are merely tolerated about the farm because the children like such pets; they are looked upon as decidedly inferior to the dog, and possessed of no special rights. We forget that we are responsible for the happiness and well-being of any animal we take into our charge; it is our duty to act as its special Providence, and thoughtlessness that results in needless suffering is quite as reprehensible as deliberate cruelty. Children and kittens seem born to harmonize; nothing is prettier than the human and feline baby gamboling together, but the child must be taught gentleness with its playfellow. Too often, when a rough squeeze causes the kitten to unsheath its needle-like claws, the child receives no admonition for his carelessness, the cat alone being punished.

Cats, like all other pets, are influenced by their environment; they are gentle, affectionate, and intelligent, in accordance with their surroundings. Contrary to a current impression, a cat kept on short rations is not the best hunter, because its senses are not so keen as when in good physical condition. A well-fed (not overfed) cat is likely to be the best mouser. Raw meat or fish is not advised; the food should be well cooked, and liberal in vegetables. Food vessels should always be kept clean, and conveniences for drinking should be supplied, as cats suffer severely from thirst. Grass is necessary to keep them in good health; this they find for themselves in the country, but in the city it is well to sow a little wheat or rye in a box, for the cat's comfort. Catnip is, of course, a luxury to them.

People who do not care for cats assert that they are not so intelligent as dogs. Personally, we are inclined to the contrary opinion; the dog, however, has the advantage of close human association, and of breeding intended to intensify certain lines of intelligence. It would not be difficult to adduce instances showing memory, reason, gratitude and affection on the part of the cat. The thoughtful tabby shown in Fig. 330 is reproduced from a leaflet entitled "Only a Cat," published by the Humane Education Committee, Providence, R. I., which gives, in compact form, instructions for the proper care of such animals.

CLOTHING A DESERT ISLAND WITH TREES.

A good illustration of the peculiar public benefit to be obtained from scientific agriculture is given in the efforts to plant trees on Sable Island. This barren place lies about 90 miles off the coast of Nova Scotia, or 155 miles from Halifax. It is about 21 miles long, and lies in the shape of a crescent, without harbor or sheltered landing place. The Island is low, and dangerous shoals abound. In time of fog or storm it is really impossible to see the low sand bars of the Island and many a good ship has been dashed in pieces on its treacherous coast. Wrecks of vessels are to be seen all around the shore. The Canadian government determined to do something that would make the Island a clearer mark for the mariner's eye, and after much discussion it was decided to plant trees in the hope that the dark foliage would show above the water. Prof. William Saunders, of the Canadian Department of Agriculture, went to Europe and made a study of tree planting along the drifting sands of the French coast. Of course special varieties are required for such a barren, wind-swept place as Sable Island. Selections were made from tested French varieties, and also from those which have done well in Canada. In all, 81,600 little trees were taken to the Island for planting. An idea of the labor involved in this enterprise may be had when we understand that



A WELL-KEPT FARM CAT. Fig. 330.

the Island is visited only twice a year. The only way to reach the land is to ride in with the boat on the crest of the breakers and then wade or ride on a stout man's shoulders through the shoal water. In this slow and tedious way the planters were landed with their trees. It was necessary to select the best sites for the planting, but finally 10,000 were planted and the rest left for the lighthouse keepers to handle.

It is not known yet how the trees have behaved during the Summer. Prof. Saunders writes us that he heard from the Island three weeks after the planting. At that time the pines, maples, willows, poplars and arbor vitæ were looking well, with fair prospect for success. This experiment will be watched with interest, for the problem of reclaiming and saving the thin lands along the sea coast is an important one. The farmer and forester in a case of this sort are called upon to save human life by erecting a living danger signal far out at sea on this sandy bar. It is the chief business of the farmer to nourish and maintain life, but here his science and experience must be used to warn the doubtful crew of the danger that confronts them.

The season now closing has been the most profitable to the farmers of Maine that I can remember. Our hay and grain crop was excellent, and the barn of every thrifty farmer is well filled. The corn crop, both sweet and yellow, was never so good. On June 16 I planted a lot of the old-fashioned 16-rowed flint corn for the silo, and am now husking 100 bushels of nice sound corn per acre from this late-planted crop. Our apple crop in central Maine is not large, but of good quality, and will bring a good price. Buyers from Boston and New York are here, and offering from $2.50 to $3 per barrel. Hay to press is selling at the barns for $10 per ton. Potatoes are a fair crop and good quality. A good driving horse sells here for about $150, and a good Jersey cow for $40. Beef and working oxen are high.

Skowhegan, Me.

HOW TO MAKE A FUMIGATION HOUSE

So as to Distribute the Gas.

PART II.

These results have considerable practical bearing upon the construction of the fumigation house and the process of fumigation. Until recently almost all fumigation houses have been built with solid floors, and the gas generated from a vessel which should be placed in the center of the room. Where the house is so constructed that a load of trees can be brought in and left on the wagon, a vessel can be readily placed under it in the center of the room, but where the trees are unloaded and packed in the room, it is decidedly inconvenient to leave a place in the center for the generator, and, as a matter of fact, I suspect—basing my suspicions upon observation and information from nurserymen—that but few of them do so, but merely leave a space near one corner near the door, and there place the generator. It is true that in a fumigation house packed full or partly full of trees the gas surrounding them would be much stronger than were the same amount generated in the same space empty, so that the manner of diffusion of the gas of a given strength in an empty room would not necessarily apply to it when full of trees. But on the other hand, it must be evident that the diffusion of a gas will be much slower where the currents of gas and air are impeded by the room being packed full of trees, so that these two considerations more or less balance each other. It must be evident then that if the gas generated in one corner of a room requires 37 minutes to kill a guinea pig, it will not kill the San José scale, or other scale insects, which are much harder to kill, in 30 minutes, which is the time often allowed by nurserymen when rushed, and it is exceedingly doubtful whether it would do so, under such conditions in 45 minutes.

Prof. Webster was the first, I believe, to note the possibility of incomplete diffusion with a solid floor, and recommended the use of *a slat floor* on which to place the trees, and devised an apparatus for dumping the cyanide into the generator *placed under the center* of this slat floor. Recently, Prof. Johnson has also recommended the use of a slat floor. The utility of this arrangement is readily seen from the above account of the poor diffusion of the gas when the generator is placed on a solid floor in the corner. Prof. Webster informs me that most of the fumigation houses in Ohio are so made, and certainly all new houses should be so constructed to insure proper distribution of the gas. Indeed, old houses might be easily fitted with a slat floor above the present one, merely leaving room enough between for the generator. In addition to a device for dumping the cyanide into the generator under the center of the floor, I have devised a hood and tubes extending from it, as shown in Fig. 329, which necessitates the gas coming into the room from eight different apertures placed almost equi-distant beneath the slat floor, thus insuring an almost immediate complete diffusion. Underneath the slat floor run smooth wooden tubes, three inches square, along the diagonals of the room, and opening into a hood placed at the center covering the generator. These tubes, each of which extends from the center two-thirds of the distance to the corner, are open at the ends, and also at points one-third from the center, thus affording eight points for the escape of the gas. The bag of cyanide is placed on the shelf, and the vessel containing water and acid is placed in the box A, at the end of the sliding board B. This board is then pushed down the incline C, and when under the hood the outer end is pushed down and held in place by a tightly fitting sliding door. The shelf on which the cyanide is placed, rests on a pivot, D, and projecting upward from it is a rod, E, thus forming a trap; so that when the box is thrown up beneath the hood this shelf is tipped and the cyanide dumped into the generator. This device is simple, easily made, and cheap, and it is believed will be found to add very considerably to the effectiveness and safety of the use of hydrocyanic acid gas in the fumigation house.

E. DWIGHT SANDERSON.

Delaware Experiment Station.

EXPERIMENTAL shipments of Bartlett pears to Europe were made by the Government last Summer. Prices for fine stock were good, but the best way to pack and handle for this long shipment has not yet been learned.

IT is predicted that America will ship 600,000 barrels of apples to Europe this season, though where they are to come from is a mystery. Canada will ship nearly half of this. "Kings" are now selling at $5.50 per barrel in Liverpool.

My white beans have turned out well, over 20 bushels per acre, but I do not think they will average over 15 bushels in western New York. Red kidneys are a very short crop all over.

FARMERS' CLUB

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Good Plums; Bosc Pears.

W. J. B., Medina, N. Y.—1. I have about 90 Niagara plum trees, but the fruit rots so badly that I get no profit from them. Would prunes do well if grafted on them? If so, what variety would be best? 2. I wish to graft some Angouleme (dwarf) pear trees to some good late variety. Is Bosc a good one, or is there some better kind for profit?

ANS.—1. Fellenberg is one of the best of the prunes, and is much less liable to rot than the Niagara plum, which is properly called Bradshaw. This makes a very fair stock for the Fellenberg or any of the other prunes. 2. Bosc is one of the very best of the late Fall pears, but it is a poor grower and does much better when grafted on some thrifty stock. Although I have never seen it grafted on the Angouleme I believe it will do well, and the fruit will surely bring a better price. It is one of the best of market pears. It also has the good point of hanging well to the tree. All things considered, I know of none that would be better grown in New York. H. E. V. D.

Fruit Questions.

H. B., Clyde, O.—1. I have some Wragg cherries set among European plum trees that are badly affected by leaf spot as well as the plums. They have all been sprayed several times according to directions for leaf spot, and yet are badly affected. The plums are in their fifth season, and have made a very stunted growth on good soil. The leaf spot has held them back so every year that parts of some of them begin to die in spite of spraying. Other kinds of cherries than Wragg, not among the plums, are not much affected by leaf spot. Is the Wragg more liable to leaf rot than other cherries? 2. The Wragg cherries are also knotty. Does the fungous affect the cherry, or what is the probable cause of this trouble? 3. I have had no fruit on any of 200 plum trees of different varieties of European type, so I tried grafting a lot of them early last Spring to Burbank, but did not get a scion to live. A neighbor had the same experience. Where I grafted Japans on Japans they grew nicely. The Japans are not affected much by leaf spot, and if I could work the tops of those Europeans over some way to Japans, I could get something out of them perhaps. Do you think I could bud them in the top, and if so, at what time? 4. Should I bud on to last year's wood? 5. Should I cut buds from this year's wood? 6. Do you think that the Burbank is the best "business" plum? 7. I would like to set an orchard of Windsor and Dikeman cherries for commercial purposes. Do you think that advisable on land worth $150 per acre?

ANS.—1. Yes, this variety is very easily affected by leaf spot and other fungus diseases, and perhaps more so than any other variety with which I am well acquainted. There is difference of opinion among fruit growers regarding the name of this variety, most of them claiming that the true name is English Morello, and Wragg only a synonym. 2. Knotty cherries are usually caused by the Plum curculio. It is a very difficult thing to contend with, and no kind of spray seems to stop its ravages. 3. I can see no good reason for the failure of the grafts of Japan plums on European plum stocks. It has been done frequently with good success. The scions should be cut very early, and put in a cool place, where the buds cannot start until time to do the grafting, because the Japan plums start very early, and if the scions are not held back they are likely to be damaged from this cause. Budding can be done to change the trees, but it would be more tedious than grafting, because the work would have to be done on smaller branches, and more of them. The time to bud is in August and early September. 4. Buds are nearly always set under the bark of wood that is in its first year's growth, but they will grow on older branches. 5. Buds are taken from wood of the same year's growth in which the work is done. 6. Burbank is one of the very good kinds of Japan plums, and is thought by most of those who have tried it to be one of the most profitable of that class for market. 7. Dyehouse is a cherry of almost if not exactly the same character as the Richmond, and where one variety is profitable the other will be. Windsor is a much later kind and of the sweet type. Both are good for either market or home use, and will probably be as profitable as any others. To yield a net profit on land worth $150 per acre we would first have to know what better crop might be got off the land. No ordinary farm crop is very likely to do it without great labor, nor will other fruit crops be more likely to do it than the cherry, where the markets are easy to reach, provided the land is suitable. H. E. V. D.

Spring Budding for Peaches.

G. H. K., Knoxville, Tenn.—Last Summer we had a long dry spell, and my peach seedlings did not make much growth. This and press of other work prevented me from doing all the budding. Can this stock be budded next Spring? Describe fruit and wood buds, so we can get proper buds. How should we save buds for Spring budding, if it can be done then?

ANS.—Spring budding may be done on peach stocks, but my experience has not been nearly so successful as with Fall budding. Scions should be cut as soon as the leaves have fallen, and at once carefully labeled and tied in bundles with willow twigs, because they will not rot, as strings are apt to do. Place them in damp cold storage, wrapped in moistened cloths or moss. Keep them so until the bark will peel freely in the Spring, when the budding should be done. There need be little difficulty in telling the peach buds that will grow from those that will only bloom. Where there are two buds side by side at the base of the leaf one is sure to be a growth bud and the other a fruit bud. If there are three buds together the central one is a growth bud and the others are fruit buds. Many of the single buds are such as will only bloom, and they are usually larger and plumper than the growth buds, but by setting only the double and triple buds there is no possibility of making a mistake. I always prefer to set them. Single buds on scions cut from young nursery trees are much less liable to be fruit buds than those on scions cut from bearing trees. H. E. V. D.

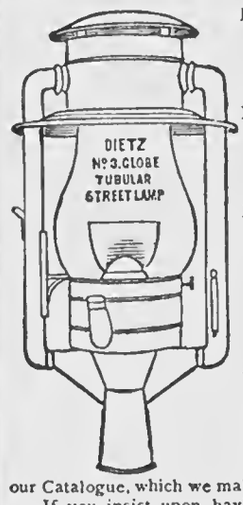
Pruning and Feeding Bush Fruits.

J. H. R., Middle Island, N. Y.—What is the best time to prune raspberries and blackberries, and how? What is the best fertilizer for above? What fertilizer for peach, apple and pear? Is there likelihood of profit in the cultivation of the Mammoth Japan chestnut and Japan walnut?

ANS.—Raspberries and blackberries are best pruned in early Spring. Cut out all dead and weakly canes, allowing one to three of the strongest to each plant, and top off to about three feet high, shortening all branches back to three or four buds. Successful pruning can only be learned by observation and experience, as the variety and manner of growth has much to do with the amount of wood to be cut away. Moderate applications of stable manure, 10 to 12 tons per acre, will grow good berries, particularly if reinforced by 200 or 300 pounds muriate of potash, or one ton of wood ashes applied separately. Any good chemical fertilizer containing three to four per cent of nitrogen, eight of potash and 10 of phosphoric acid applied at the rate of 600 to 800 pounds per acre should be sufficient. Peach trees thrive best when plentifully supplied with potash either in the form of wood ashes or muriate of potash, otherwise stable manure or chemicals as above would be suitable. The modern plan is to apply manure or fertilizer in early Spring, cultivate until July, and then sow Crimson clover or other cover crops to hold the soil during Winter and add fertility when plowed down next Spring. There is not much likelihood of profit in growing Japan chestnuts and walnuts, but they are interesting trees to plant.

However bad the Cough, relief will come through a judicious use of Dr. D. Jayne's Expectorant and in the great majority of cases, a permanent cure will follow.—*Adv.*

DIETZ
No. 3 Street Lamp
HAS A SHINING RECORD OF 20 YEARS.



It is offered as an effectual antidote for "outer darkness," and is thoroughly well made on scientific principles.
It will give more light than any gas-burning lamp, do it cheaper and do it with kerosene (coal oil).
It can be lit and regulated from the outside; can continue in business despite the wind; can and will give you entire satisfaction, by reason of its absolute reliability.
It is but one member of an enormous family of "light goods" that we build, and to whom we would be glad to introduce you by means of our Catalogue, which we mail free upon application.
If you insist upon having the very best goods made, your dealer will give you "Dietz."
If you cannot obtain this Lamp of your dealer, we will deliver it, freight prepaid, to any part of the U. S. or Canada, upon receipt of its price, viz., $6.00.

HAS COME TO STAY.

Why not buy a Mail Box which will stay with it.

Uncle Sam's Favorite Mail Box

is approved by the U. S. Government. It is made entirely of steel. Nothing to draw damp, spring, warp or rot, and is too thick and heavy to rust out. Signal shows when mail is to be collected by carrier. Has spring letter holder and change holder to pay postage when you are out of stamps. Cover fits down on box like a hood. Rain or snow cannot blow in. Strong spring keeps lid always closed. Your name put on box in durable black letters. Box finished in white aluminum; looks like silver. These boxes are in use all over the United States. If on a free delivery route, or if one is to be opened by your place, you can save money by clubbing in with your neighbors. We send a sample box complete, with your name on it, for $2.00, express prepaid. Less in quantities. Send for illustrated and descriptive booklet, "The Story of a Free Rural Delivery Mail Box and Post." We mail it free.
Bond Steel Post Co., Adrian, Mich.

STEEL WHEELS and HANDY WAGONS of every style and price are made in our mammoth factory, and sold direct to farmers. We supply all trucks used by U. S. Govt. Farmers' Handy Wagon Co., Saginaw, Mich.

ORCHARDISTS should know, that as soon as the sun shines warm enough to break the frost in the early Spring that the tree starts its season's sap activity; but it stands for days, still growing and it is dug up and shipped, sometimes being out of ground two or three weeks at the most critical time in its life. Get your trees for Spring planting now, and heel them in and be ready for the first fit time that comes in the Spring; thus saving your time, your patience, and your trees and getting better results and better selections.

THE BEST.

Those of our readers who are desirous of buying the BEST Fruit Trees that can be grown at reasonable prices, should send to Call's Nurseries, Perry, Ohio, for Price list. A large number of our leading Fruit Growers say, the BEST Trees they ever received came from these Nurseries. Call is now introducing the new Seedling Peach ARCTIC. It is the hardiest peach known, producing a full crop where all other varieties fail. It is a large Yellow Freestone of the Best Quality, ripening about the first of October.

OUR FRUIT TREES
Ornamental Trees, Vines and Plants
are grown on the banks of the Hudson River, where with favorable climatic conditions, a perfect season, rich soil and thorough cultivation, we have matured the finest and most complete list of stock ever grown in the Hudson Valley. Quality always our first aim; personal inspection invited. Fall planting gives best results. Our Summer and Autumn Catalogue free to all readers of THE R. N.-Y. Ask us for information you may need on horticultural matters, and you will have answer in next mail.
T. J. DWYER & SON,
Orange Co. Nurseries. Box 1, Cornwall, N. Y.

The October Purple Plum and Green Mountain Grape
are among the best fruits ever introduced. We are headquarters for both, and have a full assortment of other Nursery Stock. A fine stock of Shade Trees. Write for our catalogue before buying a tree of any kind. It's free.

EVERYBODY'S GARDEN.

DESTROY THE VINES.—The best possible disposition that can be made of the melon, squash and cucumber vines is to pull them up and, when sufficiently dry, pile and burn them. Left upon the ground they become the shelter and breeding place of the next year's crop of beeties, and their value for manure will in no way compensate for the damage accruing if left upon the ground. Better attend to it at once.

PREPARATION FOR WINTER WORK.—The radishes, lettuce and early tomatoes will need to be started long before the frost is out of the ground next Spring, and soil for the hotbeds should be secured this Fall. A convenient way is to pile the soil in a large cone-shaped heap, firmed down to avoid wasting by the rains or melting snow; protect with litter or straw, hold on with a few boards, to avoid too much freezing, and then it will be accessible at any time. Very satisfactory results may be obtained in the hotbed with lettuce, radishes and cucumbers for the late Winter market. The greenhouse, while very desirable, is not a necessary adjunct of the work, and simple directions for successful work will be given in ample time for all localities.

RHUBARB.—Make sure that the rhubarb roots are in condition for the best possible results for the Winter forcing. Try forcing enough for home use at least, so few fresh fruits are obtainable at that season, and apples will surely be scarce and high this year. For sauce and pies the rhubarb will prove the most acceptable substitute for apples, and the medicinal virtues constitute a factor not to be overlooked. Better spend money for sugar to sweeten plenty of apple and rhubarb sauce than paying the long bills of the doctor who prescribes the same remedy, disguised as medicine, while your good money will pay for the fresh fruits his family enjoys.

NOW IS THE TIME.—Just now is the time to select the garden ground for next year. So many neglected this last Fall that many, very many garden operations, went by default for this season. Let us as far as possible make amends for the past by thoughtful preparation for the future. Select the warmest, sunniest spot possible, especially for the first early sowings. If nothing but wet ground is available, make it as dry as possible, either with surface or under drains. Where the ground is not liable to wash, the Spring operations may be hastened by plowing or spading some portions of the ground this Fall. In this case, however, a dressing with manure or litter which is entirely free from weed seed is advisable. In this way more attention can be paid to thorough surface preparation of the seed bed. By whatever method it is accomplished, be sure that some portion of the ground is ready for very early sowing, as onions, beets, the smooth varieties of peas, etc., will thrive if sown as soon as the surface will admit of working. The plan with many farmers is, that they can buy their vegetables much more cheaply than they can grow them. In many instances, this may be true; but in so far as my observation extends they usually do without them to a very large extent at least. The real truth is, that quality and condition, with the convenience of having just what you want and just when you want it, taken into account, they can be grown upon the farm more cheaply than they can be purchased.

CARE OF TOOLS.—Gather up all the tools no longer required for use, and after thoroughly cleaning, apply a liberal coating of axle grease to all iron or steel parts, or resin and lard in the proportion of one to three in the order named. Melt over a slow fire and apply when warm enough to spread easily. Stored in a tin box or can it will keep for any length of time. Store the tools carefully, and next Spring see if it was not time well spent. J. E. MORSE.

Advertisers and Their Catalogues.

I would like to see discussed the ethics of the catalogue business. There are catalogues of all kinds—of seeds, nursery stock, vehicles, implements, merchandise and nearly everything under the sun. Most of these are sent on receipt of a postal card request, and many of them are quite expensive, including the necessary postage. Now the point is this, is it right for one to send for these catalogues unless he expects to order something from them? It is true that I have very frequently sent for a catalogue with little or no expectation of ordering anything from it, and yet on looking it over have found something I wanted and sent in an order. Still, it seems to me that one should not send for an expensive catalogue unless he has something of an expectation that he will order something from it. I suppose that those who issue catalogues look at it as being a necessary adjunct to their business, just as other houses send out traveling men for the same purpose. They set aside a certain sum for this purpose, and this is added to the selling price of their goods. I recently purchased a vehicle, and found just what I wanted in the sixth catalogue that I sent for. I suppose I paid for that catalogue and others that the firm sent out, and from which no return was received. If this advertising expense could be eliminated goods could be sold cheaper, but it is difficult to see how many kinds of business could be carried on without it. The question that I wish to see answered is, whether it is morally right for me to send for any catalogue that I desire, if I comply with the terms upon which it is offered?

Petersburg, Ill. O. J. B.

Cow Feeds Compared.

K., Kutztown, Pa.—Which contains the more protein, a ton of wheat bran or a ton of middlings? Which is the better feed for milch cows, middlings or an equal mixture of rye and oats (ground?)

ANS.—In Feeds and Feeding Prof. Henry gives the following analyses of digestible matters in Spring bran and middlings:

	Protein.	Carbohydrates.	Fat.
Bran	12.9	40.1	3.4
Middlings	12.8	53.	3.4
Rye	9.9	67.6	1.1
Oats	9.2	47.3	4.2

We consider middlings a better food for milch cows than ground rye and oats. Rye gives a softer butter than the wheat feeds. We do not like to feed middlings alone, as they make a pasty mess. We would rather feed bran mixed with them.

Tame Grass for Idaho.

E. E. O., Harrison, Idaho.—I have about 300 acres of meadow land lying along the Cœur d'Alene River. During the Winter and also in May and June, the water backs up from the lake and covers this land to a depth of from six to 10 feet. The meadow grows a natural joint or "rush" grass, which makes a very good feed for cattle, but is poor for horses, and unsalable. We cut our hay from July 25 to September 10. What tame grass can I grow on this land, and what method will be best to get it started? I do not believe that the meadow gets dry enough to plow.

ANS.—The only grass to be advised as a "tame grass" that will grow under the conditions that E. E. O. describes is Phalaris arundinacea, commonly known as Reed Canary grass. This grass is a rather coarse perennial, native to the northern parts of this country and Europe, and is somewhat cultivated on very wet soils. The seed of this grass can be secured of leading seed dealers in this country, but at present is rather high priced, owing to the small demand. This species makes a hay of very good quality if cut before the seeds are ripe; later than this the stems become hard and woody, and stock does not eat it readily. It is extremely doubtful whether even this species would thrive under the conditions stated, although it is a grass that is adapted to very wet soils.

ELMER D. MERRILL.

Killing Wild Morning-Glory.

A. H. C., Covert, N. Y.—Have any of the numerous readers of THE R. N.-Y. had any experience in eradicating the wild morning-glory? If so, will they give the most effective remedy? I have a small patch on low rich soil; have tried salt and smothering with straw a foot or more deep, and it still thrives.

ANS.—The wild perennial morning-glories or bindweeds are often troublesome pests, very difficult to eradicate. They can be killed out only by persistent cutting as fast as they appear above ground. The main thing is not to allow a leaf to expand, and the roots will become exhausted in time. They penetrate so deeply that salt and other weed-killers have little effect, and are able to send up shoots through a very thick covering. Clean and persistent culture is the only practical means of exterminating such plants.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

PROF. MUNSON'S NEW GRAPES.—We have about a dozen of Prof. T. V. Munson's new hybrid grapes under trial, most of them being selected for this northern locality. Three varieties, growing in a favorable place on the south wall of a poultry yard, fruited quite profusely, considering they have only been planted two years. The others are young vines set this season, and with one exception have made a satisfactory growth. The three bearing vines all made a tremendous growth of canes, which is explained by the roots getting under the poultry run. R. W. Munson was the first to ripen, coming in by August 30, just before Concord. The clusters were large and round, with an occasional shouldered specimen. The berries were of medium size, running a little smaller than fine Concords; black in color, with a thin blue bloom. They hung on well, and resisted rot better than any grape on the grounds. The quality was sweet and juicy with a mild acidity in the tender pulp about the seeds. The foliage is healthy, and is holding on well. Evidently a very promising variety for our conditions.

BIG HOPE also made a strong growth, throwing canes over 18 feet long. It set many long straggling clusters, some containing 10 to 12 ounces of grapes. They were barely ripe enough to be agreeable October 1. The berries are very persistent, clinging tightly to the pedicel, globular in form, and rather less than medium in size. The color is rich dark red, and the quality sprightly acid, with a small tender pulp. It appeared very resistant to rot and mildew this trying season. The parentage of both Big Hope and the preceding variety is given as Post Oak (Vitis Linsecumii) x Triumph, but the varietal differences are well marked, R. W. Munson being plainly the most desirable grape for our use. In the Munson catalogue Big Hope is offered as especially adapted for the South, though it may develop value here as a late variety.

BRILLIANT set some fine clusters which were decimated by rot, while the leaves were damaged by mildew. A few bunches ripened up by the middle of September. The berries were handsome dark red, and of fair but not high quality. This variety is a cross of Lindley and Delaware, and is becoming well known in the North. We have seen some fine clusters of excellent quality at exhibitions, but its susceptibility to rot may greatly lessen its value for commercial purposes. The growth of canes is all that can be desired in our plant, and it is probable, with increasing age and in a normal season, that Brilliant will acquit itself more creditably. The grapes on these young vines were borne too near the ground for good results. Next year we hope to have them at a height of five or six feet.

THE WICKSON PLUM.—One of the interesting hybrid plums sent out by Burbank is the Wickson, which has been quite generally planted, and is now fruiting in many places. It is given as a hybrid between Kelsey and Prunus Simoni. Some of the very large yellow plums, labeled Wickson, seen at late exhibitions, were remarkably like Kelsey, though the latter is supposed to be out of its range in New York. It is possible that some mixtures have occurred in budding, as Wickson is a dark red plum of less average size than Kelsey, though of the same form. Fig. 328 shows a fair specimen. The red ground color is dotted and shaded with yellow. The quality is very good, the flesh being meaty and solid, clinging to the stone. It ripens in early September, but keeps fairly well, and is likely to prove a good shipper. It is regarded in some quarters as a light bearer, but its beauty and good size secure it a market when seen. Our young trees are among the earliest bloomers, which is certainly not a recommendation, but have not yet been allowed to bear. The blossoms are almost as flimsy as those of its pollen parent, P. Simoni, and would appear quite susceptible to injury, but some of the shrewdest growers who have fruited it are planting more, showing that they are satisfied of its merit. The tree is a vigorous and very upright grower.

FERRY'S NEW MORNING-GLORY.—Seeds of the new morning-glory Aurora, disseminated by D. M. Ferry & Co., Detroit, Mich., were sown last April in pots, and turned out in the garden in May, together with plants of the giant Japan or Emperor morning-glory of which Aurora is said to be a hybrid. Both varieties grew with vigor, and came into bloom late in August. The blooms of Aurora are large, and produced with remarkable freedom. The colors are bright crimson or deep blue, both with white throats. Neither shows the beautiful markings and odd frills so common in the Emperor type, but the new variety is plainly more robust and free than the common morning-glory, though much later in coming into bloom. Although our plants had little chance to display their capabilities, the great knotted masses of vine show that they would climb high and cover an immense surface. The seeds germinate freely, and in this respect are more satisfactory to handle than the Japan varieties, which generally need to be notched or filed before planting, and often come up weak and spindling even under the most careful treatment. The coloring of some of these oriental forms is marvelously fine. They are usually grown in pots in their native country, and particular varieties are highly prized. Early in the last century the culture of fine morning-glories had a great boom in Japan; seeds of prized sorts selling at a price equivalent to $30 apiece. These varieties were first introduced as a novelty in this country about six years ago, and some of the earliest specimens were grown on the Rural Grounds. The original defects of weak germination, lack of vigor and late blooming have been corrected to some extent by importations of better seeds and the production of some good home-grown strains, but they are not yet seen as frequently as their merit deserves. Aurora should meet the popular demand for a vigorous and free-blooming annual climber for quick effects on porches, screens and trellises, but is not equal to many Japan sorts for individual beauty. Both the common and Japan morning-glories probably belong to the same species, Ipomœa hederacea, though the Japan sorts are supposed to have been crossed with related species. W. V. F.

Fruit Notes from California.

The Rambo is a poor apple in this valley when allowed fully to ripen on the tree, but if picked as soon as the seeds are brown, and ripened in boxes, it is delicious. I shall try some other poor varieties that way, the Ben Davis for instance, but it is too late this year. It is possible that the Stark, Ben Davis and perhaps other varieties may be improved by proper treatment. Most fruit growers are familiar with the fact that the Bartlett pear must be picked while yet hard and ripened in boxes to preserve its flavor. When allowed to ripen on the tree it is dry and tasteless. On the other hand, some varieties of apples as well as pears are injured by picking too soon. The Easter Beurre pear and the Newtown Pippin and White Winter Pearmain are examples, and yet thousands of boxes of Newtown Pippins have already been picked in California for shipment to eastern markets. We shall not pick ours for two weeks or more, depending somewhat on the weather. The Easter Beurre pear, when properly handled, is most delicious for baking about Christmas, but if picked too green it never becomes palatable. Our work in peaches and prunes is about over, but the almonds are mostly on the trees yet. I have been contemplating a trip through the Pajaro Valley for the purpose of seeing the apple orchards and the process of harvesting for market, and also methods of drying apples. I understand that the windfalls will be dried this year, as the price is high enough to warrant it. Ordinarily this fruit is allowed to rot on the ground, and only the sound fruit saved for shipment. On account of fog, which is very frequent at Pajaro, the curing of the apples must be done with evaporators. The apples are put in a machine that pares, cores and slices them at one operation. This produces what is called "ring cut" apples. They are first put in salt water and then lightly sulphured to fix the color as white as possible. H. G. K.

Edenvale, Cal.

The Alton Peach.

The Alton peach originated near Alton, Ill., and was first put out as Emma. Another Emma from Texas was already on the market, hence that of Illinois had the name changed to Alton. It ripens about the same time as Mountain Rose, is better in quality, and in southern Illinois has proven among the better. I doubt whether it has been tested in New Jersey sufficiently (if at all) to know what it will do. It has only been out a few years, and was first brought to the attention of New Jersey growers in the Winter of 1899-1900 and then as for trial.

J. B. ROGERS.

The Pruning of Sweet Cherry Trees.

There has always been an objection to the growing of sweet cherry trees in that their nature is to grow tall and spindly, making it difficult to gather the fruit, and impossible to spray thoroughly. The tree can, however, be made to assume a form quite similar to that of the sour cherry. This can be accomplished by careful and judicious pruning, which should be practised from the very start. First select stock with a low branching head, and retain four or five of the lowest branches, cutting out all others. G. T. Powell recommends close pruning for two or three years, after which one may allow the tree to grow as it will, cutting out only dead and superfluous wood. If pruned properly at the start, the tree will retain more or less of a low branching habit. In dry windy districts a low head is especially desirable, as it shields the trunk and limbs from the hot rays of the sun, and thus prevents cracking and decay. But great care should be exercised to prevent the head from becoming too bushy, as an excessive growth of foliage will cause a decrease in fruit production.

HOPE FARM NOTES

KILLING BORERS.—Here is a letter like many others which have come lately:

A man from the South has just been here, and wants to treat my young (two-year-old) peach orchard for borers. He puts some preparation around them that forms a gas, which kills the borers, he says. He charges three cents apiece. Shall I let him *work me?* W. P.

At Hope Farm we would let this "man from the South" burn his mouth with hot words before we would let him work us by playing with the peach trees. I don't know him, and don't wish to do him any injury, but I don't believe in any such theory of killing peach borers.

Why not—do you pretend to know it all?

No; I know very little about it. I'm a beginner in actual peach culture. That is why I'm taking advice about borers only from those who are in a position to know what they are talking about. Entomologists who have spent years in studying the life history of the borer, and men who own thousands of peach trees, have no faith in such "gas" remedies. If such men can't manufacture faith out of their experience you can hardly expect me to.

Mr. Van Deman tells me that once at a fruit meeting out West a man came up with one of these Peach borer cures. He hung on so that finally a committee was appointed with our friend Van at its head to bore into the wonderful remedy. The borer-killer led them out into an orchard some distance away, found a borer's hole and painted it over with some stuff he had in a bottle.

"There," he said, "that borer will die in half an hour!"

Our good friend Van couldn't see any advantage in waiting that length of time. He took out his knife, dug the borer out of his hole, and stamped the life out of him.

"There!" he said, "he's dead *now*!"

At the South and in California washes of various kinds seem to be effective against the borer, but at the North I think the old-fashioned digging-out plan is best.

FAITH OR OBSTINACY.—So you believe in going to headquarters after information, do you?

I think I see what you are getting at, but I will say yes—at least I ought to.

Did the best peach growers you know advise you to set out those Stringfellow peach trees?

No, every one of them said that the trees would fail—one good man said I was crazy to do it. Another—probably the best authority in the country—said I would only encourage laziness, and cause hundreds to lose money and swear every time my name was mentioned.

Ha! Ha! Take your own words about the borer! How came you to have faith when these masters had none?

I didn't pretend to have faith—it was just obstinacy and nothing else. Mr. Stringfellow's arguments seemed plausible to me, though, judged by what most fruit growers believe at the present time, they were all wrong. I know, however, that some of these very scientists and practical men have, before now, whipped right around when they ran to the end of their theory, and started off on a new track. I observed also that not one of them had ever carried out the exact plan urged by Mr. Stringfellow. They said it would fail because their system of planting big trees with big roots in big holes and giving them high culture had proved a great success. It struck me that Nature ought to be asked to apply a sort of Babcock test to such an argument as that, so I planted the trees just exactly as Mr. Stringfellow suggested. If a man pin himself to faith in what others have done, he has a right to growl and play football with the advice he received if results are bad. If a man is willing to foot the bills, to be silent if he lose it all, and to keep still until there is something to say, don't you think he has a right to be obstinate and ask Nature to check off man's advice? Some great results in the world's history have been brought about by obstinacy—yes, and some have been held back for years also. Faith may remove mountains, but obstinacy will hold them down!

SHREDDING DRY FODDER.—A man might write half of a large book in reply to the following questions:

What make of fodder shredders do you use at Hope Farm? You spoke of your horses eating the fodder so readily. I have had some shredded on different occasions with an old cylinder, and stock wasted more than they ate, both horses and cattle. However, my live stock lives well, always fat, and I thought that had something to do with it. If I can get a machine to prepare fodder that the stock will eat readily, it will be business for me to purchase one, if the expense is not too great. I have a nice little dairy business here and keep about 30 cattle and six horses on 100 acres of very hilly land, and buy no coarse feed. I must raise wheat and corn for the landlord, as I am only a renter. We have had as much as 1,800 bushels of corn in one year. B. R. B.

Franklin Co., Pa.

We use a Leslie or St. Albans shredder. The cylinder in this machine is adjustable—the shredding being done by 24 sharp, slender knives. The Blizzard is well spoken of, though I have not tried it. Our machine is a large one, requiring strong power. We hire a portable steam engine and shred enough for six to eight weeks at a time. The stalks are smashed, split and crushed. The horses leave the pith and some of the butts, but eat the lighter parts of the stalks clean. At one time we used waste molasses on the stalks, and thought it tempted the horses to eat more of them. The refuse makes excellent bedding. Of course it must be understood that this shredder will not put value into the stalks if they have been ruined in the field. It might pay to run moldy and leached stalks through the shredder and put them on the manure pile, but to make good horse or cow feed the stalks must be bright and well dried. We expect to husk our corn early in November, and get the stalks under cover as soon afterward as possible.

FODDER AND FEED.—Shredding corn fodder is a necessity with us for, without any silo we could not otherwise feed our stock economically. I intend to sell hay, which as we are situated, is, I believe good practice. I have explained why we have no silo. I do not intend to do much with cows, but our stock is chiefly hens, hogs and horses. For this class of stock, it is my conviction that the grain crib and the hay mow are better than the silo. In other words, I think it pays us better to husk and shred. If, like our Pennsylvania friend, I had 30 cows, I would certainly put part of my corn in the silo, for silage is the best expanded milk one can use in a hilly country. D. C. Lewis grows corn and keeps cows. Part of the corn is left with five stalks to the hill, and part with only three. The five-stalk hills are cut for the silo, the others are left for grain. If I had a large herd of cows I would operate that way. Perhaps our friend is under contract to raise dry corn for the landlord. I believe that can be done and have silage too. We have already begun to feed stalks to the horses. They have the sowed fodder and sweet cornstalks once a day. This will last until nearly the middle of November or later. We shall begin to shred about December 1, and from then until March 1 little else but shredded fodder will be given. Why not cut the dry stalks after husking into the silo and wet them? I have never been able to find anyone who was willing to do that twice.

WEATHER NOTES.—On October 15 the Cannas by the house were still in bloom. We were still eating sweet corn from the garden on the lower part of the farm. On the high hill the Evergreen sweet corn was in tassel, but it is too small to amount to anything. One can stand on our hill and look down into the valley, where the early frost has nipped and colored the leaves, while on the heights the leaves are still fresh and green. We have had a good fall for farm work. The weather has been bright and clear most of the time, and Jack Frost has been so busy elsewhere that our late crops have had a fine chance for their lives. The Fall-sown wheat and grass have started well, and if the weather will continue favorable we shall have our work well done in time. Where one raises hay in the cornfield as we do, bright weather makes quite a difference between profit and loss.

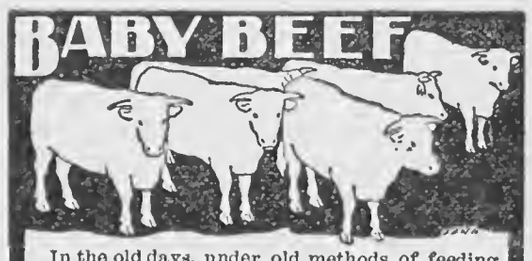
POTATO FAILURE.—There isn't any difference between profit and loss in the potato field, for there isn't any profit at all. We shall have to value our "experience" at a price heavy enough to sink it out of sight in order to come out even. Thus far we are not getting quite enough to pay for seed and fertilizer! That is the plain truth. I put no lace or frills on it, because that would be like putting filigree work on a skeleton—making it all the more ghastly. I cannot tell just how it happened, for we never used greater care in planting, and the seed was good. It cannot be because we used our own seed, for seed from Florida and seed from Maine gave a crop so poor that they are not worth digging. We did our best, but that "best" is hardly good enough to go on the books. Nature gave us fine tops, but left the tubers out. We had a chance to show these tops off and make visitors envious all through the Summer, but as we get below ground we realize that fine tops pay no taxes. We have plenty of company this year, but that doesn't take the sting out of a failure.

GOOD STOCK.—Hope Farm life is full of hill and valley. One thing that we depend on fails, and another that seemed of little account turns out better than we expected. Blossom, our oldest heifer, has dropped her first calf. She is the first of the Hope Farm heifers to begin milking. She looked so rough and beefy that I became quite disgusted with her, and was minded to put her down as a robber cow before she had a chance to prove her honesty. To my surprise the actual business of life finds her a smooth, well-rounded cow that bids fair to equal her mother. I now think it likely that her big neck and thick loin will, in time, pass down into the milking pail, and leave her pretty near to the true dairy type. Why, this heifer's unexpected value will make up for a good many of those potatoes we didn't raise! . . . And the colt promises to make up for a good many more! She's a beauty! Charlie has her now so that she will lead anywhere. He can call her up and put her halter on out in the pasture. There are possibilities in that colt, but it will take a wise and gentle man to bring them out. One man might yell at her, jerk her bridle, and give her a kick now and then, and at three years old few could be found to pay $50 for her. Another might coax and pet her, and keep her so true and hopeful that at three years she will readily sell for $400. Nature knows her business. She puts man in charge of thousands of natural forces, and pays him a premium for patience and skill. Yes, and she puts other forces over him, which he cannot measure or explain, so that he may trust and hope and work bravely on. H. W. C.

For the land's sake, use Bowker's Fertilizers. They enrich the earth.—*Adv.*

LIME FERTILIZER.
Special preparation giving splendid satisfaction. Correspondence solicited THE SNOW FLAKE LIME CO., Bowling Green, Ohio.

BABY BEEF



In the old days, under old methods of feeding it used to take 3 years to produce a beef. Improved methods, ground feed, etc., now do it in one year. "Baby Beef" has come to stay. Better buy a
SCIENTIFIC GRINDER
and get ready to make your share of it. They crush and grind ear corn shucks on or off and all kinds of small grain, separate or mixed. Send for catalogue R Mailed free.
FOOS MANFG. CO.
Springfield, O.

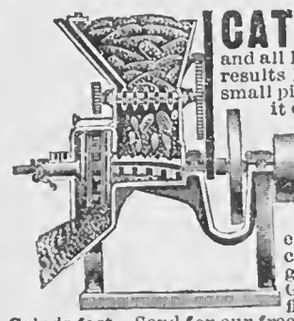
AN ACRE OF CORN
and its possibilities under the Silage system—being the theme of
"A BOOK ON SILAGE"
By Prof. F. W. WOLL
of the University of Wisconsin. Revised and up-to-date, neatly bound into a volume of 234 pages. It embraces full information from planting to feeding the crop, and includes working plans and specifications for building all silos. Also embraces:
I—Silage Crops. II—Silos.
III—Silage. IV—Feeding of Silage.
V—Comparison of Silage and other Feeds.
VI—The Silo in Modern Agriculture,
And illustrations and complete plans for round and rectangular silos, dairy barns, tables of compounded rations, etc. Mailed for 10c. coin or stamps.
SILVER MFG. CO.
Salem, Ohio.

Get all the Good
of Your Corn Crop
by grinding cob and all with the easiest running, largest capacity mill made. The
New Holland
Cob and Feed Mill
especially adapted for wind mills and other light power.

Sold on Trial. Send it back if it does not do better work than others costing twice as much. 8 Sizes. Catalogue Free.
New Holland Machine Works, Box 115, New Holland, Pa.

You can hurry
all kinds of feed cutting by the use of our
"Keystone Tony" CUTTER.
Two knives, double eccentrics, fast feed, and cuts a lot of lengths from ¼ in. up, turns easy, high speed, guaranteed satisfactory all round. Ideal for the small stockman and dairyman. Saves its cost in saving of feed the first winter.
Send for illustrated catalog and prices.
KEYSTONE FARM MACHINE CO.,
1547 N. Beaver St., YORK, PA.

STEVENS
Anti-friction, Bridge tree, Automatic adjusting, Self-sharpening, Covered gears, Light draft, Non-choking Hand, Sweep, and Power farm mills, for all purposes. Will grind all grain to any degree of fineness. Thousands in daily use everywhere. Send for free catalogue C. Agents wanted.
STEVENS MFG. CO.,
Fisher Bldg., Chicago, Ill.



CATTLE AND HOGS
and all live stock produce better results if fed ground feed. The small pig and the dairy cow need it especially. The best way to prepare ground feed is with the
Kelly Duplex Grinding Mill
It grinds anything—ear corn, cob, husk and all, cotton seed and all small grains, single or mixed. Grinds coarse, medium or fine. Takes little power. Grinds fast. Send for our free catalogue.

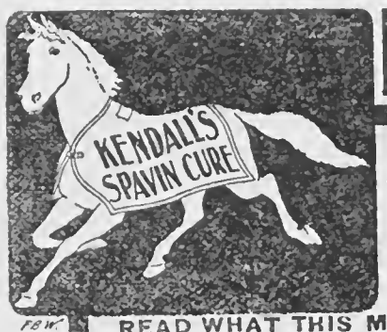
KENDALL'S SPAVIN CURE



There is no use taking chances on a lump. You can never tell what it may develop. If you have a supply of **"Kendall's"** on hand you are safe from **Spavin, Ringbone, Splints, Curb and all forms of Lameness.** The U. S. Army knows good things and buys only the best.

READ WHAT THIS MAN HAS TO SAY.
Ft. Grant, Arizona, Apr. 10th, 1900.
Dr. E. J. Kendall Co., Gentlemen:—I have the honor to inform you that your Kendall's Spavin cure is the best liniment, I believe, in the world. I have been a Farrier in the United States Army for 14 years, and have never used anything to equal it. I had a horse with hip joint lameness, a spavin, swelled glands and shoulder lameness. I used two bottles of your Spavin Cure and they are sound and well. Yours respectfully, SILAS JOHNSON, Farrier.

On sale at all druggists. Price $1; six bottles for $5. Unequaled liniment for family use. Book "A **Treatise on the Horse,**" mailed free. Address

JOHN J. DILLON, Business Manager.

SUBSCRIPTION: ONE DOLLAR A YEAR.

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs.

"A SQUARE DEAL."

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

Name and address of sender, and what the remittance is for, should appear in every letter.
Remittances may be made in money order, express order, personal check or bank draft.
THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, OCTOBER 26, 1901.

FROM reports now coming in it seems that the cow pea is giving a good account of itself at the North. This plant is poorly named. It has little to do with a cow, and is not a true pea. Taking the name as it stands the plant is truly a bovine—it is about the best *beau* to captivate the shy Miss Nitrogen that we have.

*

WE are glad to print, on page 734, the names of a few more rogues who were caught and convicted of selling oleo and bogus milk. A part of the sentence of every such rogue should be a good dose of printer's ink well set in by the type. We are glad to contribute our share of such a sentence. Publicity for such rascals!

*

WE are glad to see that Mr. Cook (page 735) advocates the plan of growing more corn on eastern farms. Somehow eastern people have found it so convenient to buy western corn that they seem to think it is a crop that belongs to the West alone! Nonsense—corn sustained the eastern people while the West was producing little besides wild animals and savage Indians. The present high price for the grain reminds eastern farmers that there are thousands of acres now idle that can be made to produce good crops of corn. We predict that next year the acreage of corn east of Buffalo will be largely increased, without seriously affecting the acreage of other farm crops.

*

ABOUT a year ago a commissioner was appointed to investigate the ration served to the "bluejackets" on American warships. One of the first suggestions made is that milk be served regularly. It is a good one. Such fighting as our sailors will be called upon to do can be done better on a diet of milk than on a dose of grog! During the Cuban War we did our best to have cheese made a part of the army ration. We thought then, and we think still, that good cheese is better suited to form at least part of a soldier's ration than the fat meat usually furnished him. At any rate, the use of milk and cheese by the army and navy will provide a new and profitable market for dairy products. If the training of fighting men is necessary, let them, at least, eat for the best interests of their country! Glory may fill their hearts, but let the old cow fill their stomachs!

*

LIGHT on the ethics of catalogue requests is desired by a correspondent in another column. He apparently feels that a request to an advertiser for a catalogue describing goods for sale, the price of which, it is reasonable to infer, includes a fair profit, carries a moral obligation to make a purchase, since the catalogue and its postage represents an outlay on the part of the advertiser, for which he would not otherwise get a return. We venture to say that advertisers in general wish the largest possible circulation of their catalogues and price lists among those really interested in the commodities listed, with the hope that a fair proportion of orders will eventually return. It is not to be supposed that a discriminating buyer will always find just what he wants, quality and price considered, in the first catalogue that may come to hand, and as the cost of several catalogues is really included in the profits on an average order, he is justified in examining those from different houses until he is satisfied. Of course requests for catalogues from idle curiosity, when there is no probability of making a purchase, are clearly wrong, though many advertisers would be glad to send them in the hope they may eventually be seen by interested parties. Catalogues often represent a large expenditure, but they describe a multitude of articles about which there would otherwise be an endless amount of costly and fugitive correspondence. They give valuable and timely information, and form permanent records of value. They displace expensive drummers or solicitors, and save the time of both seller and buyer, as they can be consulted at leisure. As the average cost of business letters under present methods is not far short of 10 cents each, it may be realized what an enormous saving is made in correspondence alone. It is safe to say that a request for a catalogue does not from the advertiser's standpoint imply an obligation to purchase, but only to examine the included offers intelligently.

*

THE State of Connecticut has gone into the forestry business. Mississippi raises cotton with convict labor, Kansas is to make butter with student labor, and Connecticut is to grow oak, pine and chestnut. The sum of $2,000 has been appropriated, and the State Forester at New Haven is to buy timber land at not more than $4 per acre. This land is to be deeded to the State but assessed and taxed by the town at the regular rate of taxation. It will be handled under improved forestry methods to show, if possible, how such land can be made useful and productive. The State will buy abandoned land without trees or with scubby growth, expecting to show what practical forestry will do for such fields. This seems to us like a valuable and practical form of education. Thousands of acres in New England never should have been cleared. They have starved the farmer, but may fatten the forester.

*

WE hear much about the use of steam power on the great farms of the West, but those western farms do not have a monopoly of this business by a good deal. Now and then an eastern man takes the steam horse out into the field. Here is one case:

A little experience may be worth something to some of your readers. I had 1,000 old peach trees to clean out, and found it rather slow work with ropes, pulleys and team. I hired a thrashing traction engine for $5 per day and coal furnished; had a stout chain 20 feet long and two men to hook and unhook it to and from the trees. Result, pulled 500 trees in 10 hours, roots and all, clean from the ground. The soil is a stiff loam, and was pretty dry and hard. The trees stood 18 feet apart, and it was very seldom that the engine had to back. G. T. W.
Monroe Co., N. Y.

We believe that the time is coming when steam and electric power will be common on the eastern farm. The streams in our hills afford cheap power for generating electricity, and it will, in time, be wired all over the country, and harnessed to suit the small farmer.

*

THE French government has ordered that berry-bearing trees and shrubs, in woods under its jurisdiction, shall not be trimmed early in the season, because the removal of fruiting twigs means distress—perhaps starvation—to many birds. It is saddening, in many districts, to see how little provision exists for these tiny friends; how soon they learn to know those who feed them. Deep or prolonged snow means distress to so many during a severe Winter; yet how cheerful and companionable they are! The bread crumbs swept from the table cloth after each meal, thrown upon a window sill, soon attract the Winter birds; so, too, does a bit of hard suet or fatty meat put upon the branches of some shrub. Rare, indeed, is the time when sparrows and snow birds are our only winged visitors, because they always find their table spread for them. When we consider what good friends the farmer or fruit grower possesses among the birds, we find a thousand reasons for supplementing their food supply during any time of scarcity.

*

EX-GOVERNOR HOARD, of Wisconsin, makes the following statement:

There is a deeper sentiment than ever among the farmers of the country that oleomargarine, in the semblance of butter, should be taxed to extinction. They are in no humor, either, to brook interference with this purpose, on the part of party leaders.

All who have kept track of the feeling among farmers know that this is exactly true. We believe that the sentiment in favor of the principles embodied in the Grout bill have become more popular than ever during the past few months. Public sentiment both in country and in town is crystallizing round the evident fact that the sale of colored oleo has become a fraud. It is a dishonest business as conducted in most markets. The American people do not object to fair and open competition, but they see clearly that if the business of counterfeiting is to be legalized, no man's trade or job is safe. For the first time in its history an avowed champion of oleo went to the National Farmers' Congress, hoping to secure the support of that organization. He failed, and it is now quite amusing to hear the oleo people say that this Congress never did represent the farmers. If the honest butter advocates had made no fight, and oleo had won the day, its backers would have glorified the Congress to the skies. You see it makes a great difference whether the ox or his sister the cow is gored!

*

A COMPARISON of military measurements in the countries where army service is compulsory or very general brings out the fact that the Swedes are now the tallest people in Europe, and probably in the world. Ten years ago the Norwegians led in height, but the average height of the Swedish conscript now exceeds his Norwegian brother by half an inch. This improvement in stature is attributed to the decrease of intoxication brought about by enlightened public sentiment, and in part by the Gothenburg system of public control of the manufacture and sale of alcoholic beverages. A similar system is in force in South Carolina, and it would be interesting to have data on the moral and physical effect on her people.

*

IF you have not already done so, examine your peas and beans for the weevil. Whatever damage has been done cannot, of course, be remedied now, but further damage may be prevented by using about one ounce of bisulphide of carbon to two to four bushels. We are not sure just how small an amount can be used effectively, but the range given above will do the work. Place the grain in a box or bin, pour the liquid into a dish, immediately cover with blankets, and the work will soon be done. Positively, *keep away* with lights or lanterns for 24 hours. The stuff evaporates rapidly; the vapor is much heavier than air, penetrating quickly through the grain in the box. Any grain so affected is cheaply and surely treated with bisulphide of carbon. Try it.

*

BREVITIES.

Oh Admiral Schley,
Did you tell a big lie?
Did you swear when you made your big loop?
Those mudslingers say
That you ran clean away
Like a chicken that flies from the coop.
It is talk! talk! talkee,
But you'll please excuse me
If I don't read a word of the stuff.
For life is too short
And the fact that you caught
All the Spaniards is quite fact enough.
We don't care a thrip
Where you went with your ship,
While we'd rather not hear people swear.
We'll shut up our ear
And pretend not to hear
For the sake of the way you got there.

STRONG actions for week days.

So fertility is too much for Jack Frost—page 723.

JACK FROST has been under the weather this Fall.

A BLUE law enforced by a green hand will make a yellow record.

DON'T feed the children on table "scraps" between father and mother.

THE demand for vetch seed is good—a chance for some farmer to grow the seed.

"THAT certainly jars me," said the peach, as it dropped into the preserving kettle.

IT is all right to "scatter seeds of kindness," but better to concentrate them where they will make a good showing.

SOME men think that their value to the world is increased by their ability to keep their trousers permanently creased.

MANY a woman performed her full share of the deeds that saved the farm, but she gets a mighty small portion of the deed to the property.

DON'T let your desire to make the yard or garden neat induce you to cover plants or shrubs needing Winter protection too early in the season.

CHAS. FORSTER, of New York, says that western boxed red apples brings $2. This means $6 per barrel, and shows what will be gained by *boxing* good fruit.

YOU may set it down as a settled fact that the plan of carrying a separator about from house to house to separate cream scores 99 in theory but 0 in practice.

THE first shipment of Florida oranges has been made. They are too green. It is estimated that there will be 1,000,000 boxes of oranges from the sandy State this year!

"THE last half of a horse's life is worth more than the first half," says Mr. Cook, on page 735. He says a good word for the horse whose age is between 10 and 20 years.

IF a man were to tell us that there is any fruit just now better than a mellow Rhode Island Greening we should have to feel sorry for him, and be thankful that we haven't his taste.

WHEN a person reaches the point which makes him incapable of learning from others he becomes a "know-it-all." He is ripe, and should be both picked and kicked.

Is there any chance for the farm boy to work himself into a good surveying practice without the advantages of a college course? That is one of the things we hope to answer before long.

THE season has arrived for testing some of those methods of collecting leaves described in THE R. N.-Y. last Winter. It was generally agreed that fallen leaves are well worth the trouble of collecting.

Events of the Week

DOMESTIC.—By an air blast at the Quincy mine, at Houghton, Mich., October 10, tons of rock were jarred down, completely covering and killing three men. . . . . Two men were killed and several injured in a boiler explosion at a saw mill, near De Witt Station, in Dinwiddie County, Va., October 10. . . . . President Lorenzo Snow, head of the Mormon church, died at Salt Lake October 10, aged 87. He was a native of Ohio, succeeding Wilford Woodruff as head of the Mor. non body four years ago. . . . . A McKinley memorial association has been formed, with the object of erecting a monument to cost $1,500,000 in memory of the late President. Appeals for funds will be made throughout the United States. . . . . Four men were killed and seven injured in a collision on the Santa Monica electric road, near Sherman, Cal., October 11. . . . . The board of health of Pottsville, Pa., has ordered all women to wear short dresses. This action is based on the ground that the long dresses, which sweep the pavement, gather up all the disease germs in the street, and are thus carried to the homes of the women. . . . . A lumber fire at Arkansas City, Ark., October 7, destroyed property valued at $500,000, including 4,000,000 feet of seasoned timber. . . . . James Gilleland and a son perished, October 13, in a mine shaft, near Connellsville, Pa., which they descended to rescue another son, who had fallen into the pit, and lost his life. The three bodies were recovered by miners. . . . . The bursting of a reservoir at East Liverpool, O., October 13, caused loss amounting to $150,000. The reservoir was a new one, filled for the first time. . . . . A disastrous fire occurred at Los Gatos, Cal., October 13, the damage reaching $250,000. . . . . The Apaches are on the warpath in the Mogollon Mountains, New Mexico, having killed five persons on Willow Creek recently. . . . . Settlers in the Mille Lacs region of Minnesota are alarmed over the ugly attitude of the Indians there; they are seven hours from a telegraph, and in case of an outbreak might all be massacred before help could reach them. The Indians have been ordered to move off homestead land, and the Government is withholding money due them because they will not go; this, together with a smallpox quarantine, has aroused their resentment. . . . . A boiler explosion at Clifton, Ariz., killed four men October 14. . . . . The village of Galien, Berrien Co., Mich., was almost wiped out by fire, which started in a laundry October 14; loss, $120,000.

ADMINISTRATION.—The total of claims filed as a result of the late Cuban insurrection and of the Spanish-American War is $57,581,807. Among the claims are the following: Deaths caused by explosion of the Maine, $1,890,000; injuries caused by said explosion, $135,000; injuries and deaths caused by said explosion, $30,000. . . . . The postal money orders sold in the United States during the past fiscal year reached a total of $300,000,000 in round numbers. This is an increase of almost $40.000,000 over the previous year. . . . . There are indications, based upon returns now being received at the Treasury, that the coming months will show a considerable falling off in internal revenue receipts as the result of the recent legislation in reducing and abolishing war taxes. Recent figures published by the Treasury Department give the cost of the Spanish War and the suppression of rebellion in the Philippines as amounting so far to $489,000,000.

PHILIPPINES.—A detachment of the Twenty-first Company of Macabebes encountered a large force of insurgents near Lipa, Province of Batangas, October 10. Lieutenant Beau, of the Macabebes, was killed, and one of the force was wounded. The enemy was strongly entrenched. After two hours' fighting the Americans retreated to await reinforcements. The insurgents numbered over 300, were armed with Remington and Mauser rifles and apparently had plenty of ammunition. . . . . It has been determined at the War Department to send troops to the Philippines to take the places of those whose terms of enlistment expires. Where the reënlistments are not large in any one regiment their places will be filled by separate detachments of recruits. If any considerable number of enlistments expire in a single organization, it is probable that the organization as a whole will be returned from the Philippines, and another regiment sent to take its place. . . . . The entire police force of Catanag, Province of Tayabas, numbering 11, have been carried off by insurgents, armed only with bolos. Presumably the police made no resistance, as they were well armed with carbines and revolvers. . . . . General Malvar, the insurgent leader, is believed to be planning an operation in the Province of Bulacan, Luzon. The police force of Banan, Province of Batangas, has been disarmed, and the chief of police arrested for belonging to an insurgent society.

GENERAL FOREIGN NEWS.—Apprehensions for the safety of Miss Stone's life are being entertained in the event of the Bulgarian troops attempting to rescue the captive missionary from the mountain outlaws, and efforts are being made to prevent any use of force by the soldiers pending the outcome of the negotiations with the brigands, which, it is expected, will result in the unfortunate woman's liberation. . . . . The Pacific coast of Nicaragua was recently flooded to the depth of eight feet by tidal waves, believed to be due to volcanic disturbances in the bed of the Pacific Ocean. . . . . The recent clash between Venezuelans and sailors on a German steamer, at Porto Cabello, may lead to international complications. Berlin advices state that the German government does not believe the bluejackets violated Venezuelan territory, and may demand an apology and reparation for injured from Venezuela. A German cruiser is being fitted out at Kiel for South American waters.

FARM AND GARDEN.—The California State Grange, in session at Petaluma October 5, selected Sacramento as the place of meeting for 1902. C. W. Emery, Oakland, was elected Master.

W. J. Hayes, an expert in growing shade tobacco on the Mitcheison farm, in Tariffville, Conn., has been engaged to experiment with shade tobacco in Porto Rico, where he will raise under shade, not the Sumatra, but the thick native Porto Rico leaf. It is hoped that the leaf can be made lighter in tint and thinner if grown under cheesecloth.

Ranchers in southern Utah and northern Arizona are trying to destroy desert horses, holding big hunts for the purpose. The mustangs are so thick in the district lying between Hurricane Ridge and Kanab Wash and over the old Canan range to Mount Trunbill that ranchers are complaining on many scores. The range is being eaten up, gentle horses are being run off, and many valuable animals are being shot by mistake by careless sportsmen firing on supposed desert horses. Two years ago there was a similar hunt, and nearly 500 horses were killed.

The next annual meeting of the Indiana Horticultural Society will be held at Indianapolis, December 5-6; secretary, J. Troop, La Fayette, Ind.

The Niagara Co. (N. Y.) Farmers' Club will hold a harvest meeting at North Ridge October 26. There will be an excellent programme in which well-known speakers will participate.

Farm Matters in Kansas.

We had a very warm and dry Spring here, terminating in quite a serious drought in June. Early potatoes were half a crop, but sold for double usual price. Wheat was good, but only a few in Allen County had any. Corn was nearly exterminated by the fearful hot and dry weather, so that there is no corn for sale, and many will have to buy, but an extraordinary amount of fodder has been put up, and there is plenty of coarse feed, but a great shortage in fattening feeds. Late potatoes are a failure; only fit for home use, they are so small. Hay has been cut twice, and was a half crop each time, making the usual amount of hay, but twice the work to make it. Fall rains have given us the best Fall pastures we ever had, and clover fields will furnish pasture until the ground freezes. The only living thing that went right ahead in all its glory was the Mammoth Soy bean. This made a growth three feet high, and gave about 20 bushels per acre of beans. I had in 10 acres of them, and they are now in my barn, and will be fed out to hogs, sheep and cattle without thrashing, a very little at a time.

Every farmer has put in a field of wheat, and there are actually over 100 times the usual acreage in. It is now about two inches high, and the weather conditions are extra favorable. The pasturage during the Winter will help out wonderfully, and if there is a crop of wheat, the grain will take the place of corn by July 1. Farmers have sold their cattle, sheep and hogs down to a very few, and as a rule have more roughage than they will use, and of course they saved only their best stock; thus the great drought has been a great purifier, so to speak. It is probable that wheat will always be raised here hereafter, and, of course, we must find a way to prevent the ravages of chinch bugs over surrounding crops. It is my plan to put in a field of Soy beans on one side and flax on the other. The bugs will not trouble either of these crops, and the flax ground can be plowed in August and put in wheat again. Everyone who put in wheat drilled in commercial fertilizer with it, and there has been a good trade in wheat drills and fertilizers. When it became apparent that all the corn had to be cut up, there was a great scramble for corn harvesters, and one concern sold four carloads in our little town. Now they are here with their shredders, and next Spring they will have to be here with their harvesters to gather in the wheat crop, and the thrashermen will have to multiply also. J. C. N.

Allen Co., Kas.

Farm Values.

Real estate does not seem to be changing hands of any account, although there seems to be quite a lot for sale, at what a few years ago would have been called low prices. I live in the edge of a village of about 3,000 inhabitants. We have two large creameries here and two corn-packing companies. A car of cream goes to Boston every morning from one company. Some farms are well kept up, while others are in fair condition, yet there seems to be an unrest among farmers. I attribute it to the high and still increasing taxes. My place is 1½ acre, well situated every way. I have one acre of small fruit; it is under high culture. I get lots of currants, gooseberries, raspberries, plums, pears and apples, yet I could not sell for near (I was about to say for one-half) what it is worth, and that is the general complaint.

Dexter, Mc. A. R. B.

New York State Cabbage Crop.

The crop is about a general average. S.

Little York, N. Y.

The weather conditions have been unusually favorable, but owing to the very small acreage planted the yield will be only about 50 per cent of the usual amount grown in this section. Crops on low lands have considerable stem rot and club-foot. The crop in general is 100 per cent better than last season. The severe drought a year ago caused an entire failure of late cabbage. A. G. M.

Elmira, N. Y.

We have a large acreage of cabbage, and until recently have had favorable weather and conditions; but our late or Danish cabbage has suffered from blight or rust, which first attacks the outside leaves and then the head, which seems to rot at the heart or core, and finally drops off the stalk. Our Warren or domestic crop was fine, which, however, is nearly harvested, being shipped to southern and western points, most of it being made into kraut. The price paid by dealers here is from $10 per ton early, or about September 10, to $7 per ton at the present time. The Danish or late crop will mostly be stored by farmers and dealers here for Winter shipment.

Homer, N. Y. LITZ & WATROUS.

The cabbage crop here is, I believe, about 10 per cent short in acreage of last year. I think the yield per acre will about equal that of last season. The heads are not as solid, and will not weigh as much, according to size. Prices now around $6 per ton. There is some stem rot and leaf blight. We are in the midst of the late potato harvest. Yields very uneven—from 50 to 200 bushels per acre; some dry rot in nearly every field and a good deal in some fields. An unusual quantity is going to market on that account. Quality of sound potatoes pretty fair, though a little rougher than last year. I don't think that carefully sorted potatoes, pitted or put in cellar in good shape now, will rot any further. Prices just now 50 cents per bushel. We think they are good property to hold for the Winter market. G. F. W.

Fairport, N. Y.

Crop Prospects.

The clover crop here in Lenox township, from what I can learn, is very good, and the yield is better than in former years. More has been harvested here than for several years. D. M. S.

Rowenton, O.

Last Summer was very dry here until the middle of August; our eight acres of sugar beets were late starting, and at this writing are still growing, with tops perfectly green. They may go 18 tons per acre. I sowed Alfalfa in two and one-fifth acres of corn August 30, and oats with it to furnish a Winter cover; cutivated both ways with one horse. Alfalfa is 1½ to two inches high now; oats five to six inches. L. C. B.

Crown Point, Ind.

OCTOBER 14.—The weather has been fine for the past few weeks, and farmers have been improving it in gathering in the crops. Apples are not quite all gathered in yet, but the crop is better than was supposed. Perhaps it may reach 50 per cent of an average crop in this vicinity. Buyers are offering $2.50 to $2.75 per barrel, and sometimes $3 for Kings. The potato crop is of an ordinary kind, and there is complaint that many are scabby and wormy. Fall feed is good and stock is looking well. The yield of sweet corn was very satisfactory to the farmers. A smart rain is prevailing to-day. T. D. S.

Grass Notes by Geo. M. Clark.

I don't confine myself entirely to the cultivation of grass. I sowed an acre of oats for hay this year. The yield was 8,190 pounds. Cut in the milk it makes excellent feed for horse or cow. I also sowed 1¼ acre to Japanese millet on land that is quite dry, but the season being wet it grew to five and seven feet high, and yielded, when well dried, 13,100 pounds. It took nearly two weeks to dry it. Some one said that it was a bad plant to get started in the land; that it made the land foul, so I removed it from the field where it grew as soon as possible, but it certainly killed hard. I could have killed the hardest sod on my farm easier. If I had let it alone it would have produced three or four tons more, and seed enough to have covered the town. When sown on moist land early it will make two large crops, 10 or 12 tons to the acre. Perhaps you will remember about my sowing some Timothy and Red-top the first of November, 1900. The grass did not come up till Spring. I let a quarter of an acre of it stand, fertilized it as usual, and cut it the middle of July. It produced less than 200 pounds of hay; 3½ acres of the same kind of land adjoining, sown 40 days earlier, produced 35,415 pounds of dry hay cut July 1. Three years ago last Spring I set out 1,425 Japan plum trees. They produced about 400 baskets this year. The fruit was very large. I used no fertilizer of any kind, but kept the land intensively cultivated to the depth of five and six inches. I didn't raise a weed or spear of grass; nothing but the largest and best flavored plums of this kind I ever saw.

Items of Interest.

IMPORTED POTATOES.—We think that there will be a good many imported during the season, especially the latter part of Winter. Crops on the other side seem to be good, and according to our correspondence all large potato-producing sections are depending on our markets to take a portion of their surplus. The principal variety heretofore imported has been the Magnum Bonum, the quality of which compares very favorably with the best of the home production. They come principally from Great Britain, Belgium and Holland.

Philadelphia. J. D. HENDRICKSON.

EXPERIENCE WITH CORN.—During planting time last Spring there was so much rain that our silage corn could not be planted till the middle of June; varieties were Leaming, Thoroughbred flint and two others highly recommended. Our success with the last two was not sufficient for us to make any statement except that we shall not try them again. The Thoroughbred flint was a little earlier than the Leaming, but did not grow over four-fifths as many pounds of silage. Our plan would be in future to fall back on Sanford for perhaps one-third of the crop; or, if we were delayed in planting as we were this year, would plant nearly all Sanford, with another trial of an acre or two of Thoroughbred flint. With a good year where corn can be planted early, Leaming would, on the whole, seem to be best. There are almost no apples this year in the State of Maine, not over 10 per cent of last year's crop. Potatoes in this section are about the usual crop, but in Aroostook County they have a very large crop, and it has been an extraordinarily good year for that section of the State. J. H. R.

Portland, Me.

Woman and Home

From Day to Day.

WHERE YE SPANKWEED GROWS.

There's a corner in our garden, but my nurse won't tell me where,
That little boys must never see, but always must beware,
And in that corner, all the year, in rows and rows and rows,
A dreadful little flower called the Spankweed Grows!

My nursie says that if a boy who doesn't wash his face,
Or pulls his little sister's hair, should ever find that place,
The spankweed just would jump at him and dust his little clothes.
Oh, it's never safe for fellers where the Spankweed Grows!

Some day I'll get the sickle from our hired man, and then
I'll go and find that spankweed place—it's somewhere in the glen.
And when I get a-swingin' it and puttin' in my blows,
I bet there'll be excitement where the Spankweed Grows!

—Paul West, in Life.

*

ACCORDING to Good Housekeeping, a baker who makes jam on a large scale says that he never stirs it, but puts a large handful of marbles on the bottom of the kettle. When the jam boils these roll around, and prevent it from burning.

*

LITTLE Agnes had been a regular attendant at the Sunday school last Winter, says the New York Sun. The other day the school opened again after the vacation and the teacher decided to have a general review of all the ground covered by the primary department. She started, very properly, at the beginning.

"Children," said she, "after Adam was created, how was Eve brought into the world?"

A half-dozen hands went into the air.

"Willie Smith may answer," said the teacher.

"Made-outen-a-bone-frum-Adam."

"Now, children that is correct. And from what bone was woman created?"

There was an awful silence in the class-room. Finally little Agnes's hand went up like a shot.

"You may answer, Agnes."

Her decision came quickly.

"The jaw-bone," said she.

*

WE recently met a severe-faced woman with an air of extreme propriety whose costume was a shrieking example of conspicuous lack of taste. She wore a very nice gray jacket suit and a gray hat, which, one would imagine, would tone down any brilliancy of color, and give a harmonious whole. But she also wore, with her low shoes, bright purple stockings with white dots, which gleamed luridly below a violent pink silk petticoat; a green silk waist with a red neck ribbon, showed under her gray jacket, and her hat was trimmed with a scarf of turquoise blue. The general effect would make a rainbow seem sad and lonesome. Every article she wore was good in quality and style (save only the purple stockings, which we could not reconcile to our conscience); yet the general effect was poor and tawdry. The fact is, that a clever combination of becoming colors always gives a look of style to the simplest dress. The girl who always looks well in a shirt waist is the one who knows just the right shade to wear in necktie, and belt, perhaps repeated in her hat. We used to see one girl last Summer, nearly every day, who always wore a red neck ribbon with a pink waist, except when she varied it by wearing a pink ribbon with a red waist, and we always felt sorry for her; it is charity to assume that she was color blind.

WHEN it is necessary to dilute very strong tea, water at the boiling point should always be used. If made strong at first, and then diluted with water that is merely hot, not boiling, the flavor is poor. The water should never be allowed to boil and reboil for tea making; it should always be used just as soon as it comes to the full boil. We think that carelessness in these two particulars is responsible for most cases where tea is lacking in flavor and aroma. To seek to repair these faults by long steeping of the tea is a fatal error, which not only ruins the flavor, but also spoils the tea for its real purpose, which is that of a mild stimulant and aid to assimilation.

*

EMBROIDERED flannels for shirt waists seem likely to achieve as great a popularity as last Winter, the patterns being similar to the printed ones. Light blue is a favorite color, one of these being embroidered all over with black rings inclosing a French knot of white. In the printed patterns white with black figure is very effective. Novelties in shirt waist materials have borders, sometimes merely a different shade or heavier weave, and sometimes an elaborate arrangement of colors or stripes. Embroidered borders are decidedly gorgeous. In making up, one strip of the border is put down the front hem, and, as a rule, straps with pointed ends are put at yoke depth on either side. The colored strips also form stock and cuffs. Clusters of tucks with straps between form a very pretty and popular trimming. Among silk waists, taffeta is still a standby; a weave called metallic taffeta, from its luster, costs $1.25 a yard, and makes up beautifully. Sicilian, a ribbed silk with a woolen warp, will be used; this is very durable, thick, and suitable for Winter wear. Plain silk waists are still freely tucked, and for this style peau de soie is still a favorite, also peau de cygne and peau de mignonne, which is a little duller in finish.

3951 Boys Suit,
6 to 12 yrs

Louisine is another of the favorite silks. Velveteen, which is really a beautiful fabric as now made, promises great popularity, though in the gay colors it has rather a tawdry look. It is a very comfortable fabric for cold weather.

THERE are a good many who are regretting that they are so without money or other material means as to be unable to do all they would like toward relieving others' burdens and leveling down the rough roads they have to walk over. But is is one of the mistakes we are all the time making to suppose that bread and milk and money are the great panacea of human distress.—Dr. Parkhurst.

The Rural Patterns.

Nothing makes a more satisfactory boy's suit than dark blue serge. The model shown is made of that material with simple bone buttons and is well adapted to school wear; but mixed cheviots and all other suiting materials can be substituted if preferred. The trousers are carefully shaped and are correctly fashioned. The vest is double-breasted, and is supplied with double rows of buttons and buttonholes. The jacket is seamed at the center back and curves

3950 Misses Norfolk Waist,
12 to 16 yrs.

to give a graceful effect. The fronts are half loose, with inserted pockets covered with laps. The neck is finished with regulation collar that rolls over with the fronts to form lapels and the sleeves are in coat style, stitched to simulate cuffs. To cut this suit for a boy of eight years of age 2⅛ yards of materials 44 inches wide or 1¾ yard 54 inches wide will be required, with ½ yard of lining for back of vest. The pattern No. 3951 is cut in sizes for boys of 6, 8, 10 and 12 years of age; price 10 cents.

Norfolk styles make a marked feature of the season and are noticeable in waists as well as jackets. This smart model is made on the latest lines and is correct in every detail. As shown, the material is fine serge flannel woven in a pretty fancy plaid, collar, cuffs and belt being of black velvet, but plain flannel, corduroy, velveteen, striped flannel, cashmere and all waist and dress materials are suitable, as the design is equally appropriate for the costume and the odd waist. The foundation, or fitted lining, is snugly fitted and closes at the center front. The waist proper is laid in box pleats that are stitched at their under folds and extend from the neck and shoulders, the closing being effected by means of buttons and buttonholes worked through the pleat at the center front. The two seamed sleeves are in dress style with slightly flaring cuffs. The neck is finished with a standing collar that terminates in a point, and at the waist is a narrow curved belt. To cut this waist for a miss 14 years of age 3½ yards of material 20 inches wide, 3¼ yards 27 inches wide, 2¾ yards 32 inches wide or two yards 44 inches wide will be required, with ⅜ yard of velvet to trim as illustrated. The pattern No. 3950 is cut in sizes for misses of 12, 14 and 16 years of age; price 10 cents.

EACH man has to seek out his own special aptitude for a higher life in the midst of the humble and inevitable reality of daily existence. Than this there can be no nobler aim in life.—Maeterlinck.

THERE is no man so angular or crotchety that we cannot get along with him if we love him. We must remember that we are just as crotchety from his point of view as he is from our point of view. Probably the only real reason why God is able to tolerate us is because He loves us. There are some people who are always ready with some little word that makes others more easy to get along with.—Dr. Parkhurst.

Leslie's Monthly Great $1.00 Offer

OUR BEAUTIFUL ART CALENDAR FOR 1902
OUR DOUBLE 25TH ANNIVERSARY NUMBER
OUR SUPERB CHRISTMAS ISSUE AND
LESLIE'S MONTHLY FOR ONE YEAR

ALL FOR ONE DOLLAR

If you mention *The Rural New-Yorker*, this great combination of art and literature will be sent witn all charges prepaid.

The Beautiful 1902 Art Calendar

artistically portrays the most "*Popular American Actresses and Their Favorite Flower*," especially painted for us by Miss Maud Stumm of New York, the famous American water colorist; size 12¾ x 10 inches, in three sheets tied with silk ribbon; lithographed in 12 colors on heavy pebble plate paper. The price of this calendar alone in art stores would be 50 cents.

FRANK LESLIE'S POPULAR MONTHLY

10 cents *$1.00 a Year*

LESLIE'S stories ring true. They are like life, and many of them are taken from actual occurrences.

LESLIE'S articles deal with every great phase of American endeavor. They stimulate while they entertain.

To appreciate LESLIE'S serials you must become a subscriber. A wonderful novel by Maurice Hewlett, author of "Richard Yea and Nay," begins shortly. Other brilliant serials follow in quick succession.

Such men and women as Nansen, Zangwill, Ballington Booth, Henry van Dyke, Owen Wister, C. G. D. Roberts, "Ralph Connor," Booker Washington, Frank Stockton, Mary Wilkins, Margaret Sangster, Conan Doyle, Eden Philpotts, Sienkiewicz, Hopkinson Smith, Quiller-Couch, Bret Harte, and a multitude of others, make LESLIE'S MONTHLY appeal distinctively to the active man, the intelligent woman, and to boys and girls who mean to accomplish something.

The Double 25th Anniversary Number

for November will be a revelation in magazine making. 168 pages superbly illustrated in black and white and colors.

The Superb Christmas Issue

will be another masterpiece of literature and art. Beautifully illuminated in colors by the leading artists of the day.

Leslie's Monthly for 1902

12 numbers presenting all that's new, all that's interesting, all that's beautiful: **Making in all, The Art Calendar and 14 Numbers all for $1.00.**

Specimen copy and illustrated Prospectus 10 cents, which amount will apply on your subscription sent to us, should you accept the above offer.

House Plants for Winter.

It is the hardest thing in the world not to gather in too many. Such a lot of plants are in the beds, which we know would do well in the house, under proper treatment, that we are tempted to nip off slip after slip, cheating Jack Frost of his lawful harvest. I raised a dozen different kinds of Coleus from a packet of seed planted in the Spring. They were about the tiniest seedlings I ever saw, but made a fine show by the first of August; rather late, of course, but learn to labor and to wait. One specimen leads the others by a long stretch, being in color a rich, glowing crimson or cherry, with leaves like thickest velvet. "I must have a slip of that," said a friend; "won't it make a fine show in my south window this Winter!"

I have gathered in 14 Abutilons, or flowering maples, raised from seed and kept in pots in a half-shaded place during the Summer. Two have blossomed, one yellow and one white, and most of the other plants are budded. They make pretty graceful window plants, and are continuous bloomers. A rose-colored one planted in a shady border last Summer has grown to be a fine little tree. I shall try to lift it carefully, but am very much afraid that the experiment will prove unsuccessful.

Geraniums, slipped in July, are now budded. A great deal of advice is given to amateurs not to bother with geraniums for Winter, but where can we get such bright masses of color as the scarlet and pink geraniums give us? It is useless to try to grow them in a little, close room without much sunshine. They must have air and light. They do best in rather small pots, and must be watered sparingly. A pink Winter-blooming Verbena grown in a southwest window was beautiful, as were also some double white and purple and white Petunias. Pelargoniums, commonly called Lady Washington geraniums, are beautiful early Spring bloomers, the pink and white variety, known as Apple Blossom, outdoing the others in profuseness of flower, sometimes literally blooming itself to death; but the scarlet are lovely, as are also the rich dark pink, and white blotched with crimson. The pink ivy geranium is another lovely plant for the window. Another pretty addition to a window is what we call a mosquito plant—neighborhood name. It is neither a vine nor a creeper, but a twiner, with very small leaves and tiny, red-winged blossoms. It is a rapid grower, and is prettiest when given a round support of wire upon which it can twist and turn to its heart's content. The Manettia vine with its dark green foliage and tiny fire-cracker blossoms is also a standard plant for the sitting room. The lobster claw cactus is a pretty October bloomer. I have seen specimens that were truly gorgeous for a week, or, perhaps, 10 days, and then one must wait a year for another show. I have two of these peculiar individuals; sometimes they are lovely and sometimes not—just as it happens.

A rubber plant that in 1898 was about 12 inches in height has now grown to be a fine, strapping six-footer. I "beheaded" it in 1899, and in 1900 it put out two branches that have made a pretty even growth ever since; a third branch has started lower down, and I think I shall have to cut off the buds of the two older branches and give the new one a chance to catch up with them; also, force more side growth. But you've got to dust your rubber plant every morning, just like a chair or table, or it will tell everyone who notices it that its mistress doesn't really care for it. Some one has called dust "the bloom of time," but is there, in the whole, wide world, a neighbor who would look at it in that poetical light? Civilization just means neighbors, that's all!

A half dozen or more bulbs of Oxalis planted in a broad, shallow pan or in a hanging basket will bloom continuously throughout the season. I like the pink ones best. Lantanas are also desirable Winter bloomers, and I saw some lovely pots of Phlox last Winter, four or five little plants in one pot; about Easter they were a mass of lovely color. The Plumed asparagus (A. plumosus nanus) is a favorite with my friends; I like ferns better. A well-grown Boston fern is simply grand, and requires a grand amount of space. An umbrella plant keeps you busy dancing attendance with the watering pot, or the leaves will shrivel up and must be cut off, and it's very provoking to have a fine, artistic piece of greenery go back on you that way. Begonias require a whole chapter, and lilies and hyacinths another. The Fall catalogues are as tempting to a country girl as bargain counters are to her city cousins. DOCIA DYKENS.

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

Scraps and Carpet Rags.

Mary has been fitting up her room, says a writer in the Kansas City Star, and her rugs particularly pleased me. Three were plain white, one white with a dull blue border, and the fifth a shaded blue.

"You see, I couldn't afford to buy new rugs, so I gathered all the clean, white scraps I could find, cut them into strips in the usual way, and got old Becky Martin to weave them these especial sizes. This white fringe on the edge is knotted warp.

"The blue rug is of wool strips. It took me a long while to collect so many shades of blue, and Becky wove them, 'hit or miss,' as she called it, with bright blue warp."

"But the white ones will soil quickly, will they not?"

"What if they do? They can go into the washtub every week if necessary. See that one by the bed? Would you believe it has been washed twice? And it is so pleasant to step out of bed on a dainty white rug."

"What is that divan cover made of?" I asked.

"Oh, old ribbons and silk pieces. I had seen silk portieres, and thought a couch cover would be pretty. The strips are cut only a half inch wide, and woven very loosely."

I lifted it and found it was as light as eiderdown. She had had it woven with black warp. On each end was a stripe of plain blue a foot wide, then a mingled narrower one, and next an inch wide black. Then yellow and red. The body of it was "hit or miss." The old weaver had done her work well.

"But did you not grow tired of sewing rags?"

"No, indeed. I'll tell you how I sew them. Say I have a piece of goods a yard square. I cut it into a number of equal strips, and lapping the end edges, sew them twice on the machine. Then I go round and round with sharp scissors, cutting spirally, as it were, and it comes out in one long strip. It is lazy girl's carpet rags!"

She took me into the hall.

"Do you see that rug? What do you say it is made of?"

I bent to examine a beautiful square of dull red, woven with a black warp, which had an expensive look.

"That is made of an old chenille portiere. I cut it into long, even strips, sewed them together on the machine, and the cutting did not take me long. It only cost me 35 cents to have it woven and the warp was 25 cents. It is a splendid way to use up half worn chenille curtains or table covers. The strips are to be cut almost an inch wide for rugs, and narrower for divan covers."

"You clever girl, tell me about that pretty pillow I see there, of as many colors as Joseph's coat."

"Well, I'm tired of crazy quilt and log cabin silk work, and I wondered what to do with my scrap silk. I cut silk into pieces two inches square; fold them once in the middle—now, that makes a long strip. Then I bring the two ends down to meet the folded bottom edge, and this forms a triangle like a cocked hat. I sew a row of these, points upward, on a foundation, and the next row overlaps it, the points alternating with those of the first row. The whole pillow, then, is of vari-colored silk points lying flat. It makes a pretty pillow to brighten a corner."

"And they're quite as pretty when they get a little ruffled," I said.

"Now, before you go, come and see my bookcase. I didn't have room in my shelves for the volumes of the Century Dictionary, so I got a box that just fit the set, and another one just as long, but narrower, for the top box. I nailed them together and covered them with tea matting, inside and out."

Sure enough, the dictionary was in the lower shelf, and the upper space held reference books, and she had them set against her writing desk to save space.

Rural Recipes.

Panned Guinea Fowl.—Dress as you would a chicken, cutting the fowl up as for fricassee; place in covered baking pan with a large tablespoonful of butter, a cupful of boiling water, teaspoonful of salt and one-fourth teaspoonful pepper; cook until tender, basting frequently. Remove cover to brown, then take up the meat on to a warm platter; thicken the gravy in pan with tablespoonful of flour, add water enough to make a pint of gravy and pour it over the meat. A garnish of parsley is appropriate. Serve creamed potatoes with this dish.

Mutton Ragout.—Cut the mutton into two-inch lengths (three cupfuls in all), season with a small teaspoonful of salt and one saltspoonful of pepper and dust lightly with flour; place two tablespoonfuls of butter in a pan, heat very hot and place in the meat; brown well, shaking often; draw the pan to the back of the range; lift the meat out with a skimmer and place it on the serving dish; add one medium-sized onion and a sprig of parsley minced; cook for five minutes and add one cupful of milk; when hot add a saltspoonful of salt and two tablespoonfuls of flour stirred to a paste with a little cold water (about one cupful), cook for 20 minutes and stir frequently to prevent scorching; add a pint of chopped oysters 10 minutes before serving, then pour it over the mutton and serve at once. The oysters must be drained well before adding to the gravy. Excellent. Serve with grated cheese.

Preserved Citron.—Slice the citron crosswise in slices one-third of an inch thick. Peel and remove the seeds. Cut citron into one-third inch dice. Place them in a porcelain kettle. Add one-half cupful of salt to each five pounds of fruit. Cover with cold water and let stand over night. Drain and cover with fresh cold water. Soak two hours, changing the water four or five times. Dissolve one tablespoonful of pulverized alum in two quarts of boiling water, pour over citron, and bring to boiling point. Drain. Prepare a syrup of 2½ pounds of sugar and 1½ quart of boiling water. Boil and skim. Add citron, and simmer gently until clear and tender. Drain citron from syrup. Set in the sun for two hours to harden. To the syrup add the peel of one large lemon, using only the yellow rind shaved off as thinly as possible. Add the juice of two lemons and a small piece of green ginger root (two inches long) sliced in thin slices. Boil gently for 20 minutes. Set aside. When citron is hardened, fill into glass jars and bring syrup to boiling point and strain it over citron. Treat watermelon in the same manner.

Baked Indian Pudding.—One quart of scalded milk, with a teaspoonful of salt added, 1½ cupful of Indian meal (yellow), one tablespoonful ginger, letting this stand 20 minutes; one cupful molasses, two beaten eggs, a piece of butter the size of a common walnut. Bake two hours in slow oven. Serve with caramel sauce. To make this, put one cupful of sugar in a small pan and stir on the fire until brown; add one cupful of boiling water and simmer 15 minutes. Set away to cool slightly and serve with the Indian pudding.

Warm Molasses Ginger Bread.—One cupful of brown sugar, one-half cupful of butter, one cupful of milk, three cupfuls of flour, three eggs, one tablespoonful of ground ginger, one tablespoonful of ground cinnamon, one teaspoonful of cloves, one teaspoonful of soda. Mix butter and sugar to a cream. Then add the molasses, eggs beaten separately; spices, and then the flour. Dissolve the soda in the milk and put into the batter just before baking.

Cream of Celery Soup.—A pint of milk, a tablespoonful of flour, a head of celery, a large slice of onion and a small piece of mace. Boil celery in a pint of water from 30 to 45 minutes; boil mace, onion and milk together. Mix flour with two tablespoonfuls of cold milk and add to boiling milk. Cook 10 minutes. Mash celery in the water in which it has been cooked and stir into boiling milk. Add butter and season with salt and pepper. Strain and serve immediately.

EASY TO FIND.

When you find a medicine that makes your regular food taste good, when you find a medicine that strengthens a weak stomach—then you know you're going to put some flesh on.

Scott's Emulsion does these things. We recommend it whenever the system needs more flesh. If you are thin and able to eat begin regular doses. That's your part. Scott's Emulsion will do the rest. Not flabby—but solid flesh.

We'll send you a little to try, if you like.
SCOTT & BOWNE, 409 Pearl Street, New York.

FAMILY OF DOLLS FREE

Of course every little girl loves a Doll, but how delighted she would be with a whole family of Dolls with which to "play house." Besides the Boy and Girl Dolls here pictured, there is a Grandpa and a Grandma Doll, Grandpa in full military uniform, and Grandma in the dainty costume of the olden time. The large dolls are nearly two feet high, the small ones 15 inches. They have rosy cheeks, beautiful hair, heads that will not break, eyes that will not fall in, and are handsomely dressed in bright colors that will not fade. Words can never express the delight which any child will feel in possessing this Doll family. We will give these four beautiful dolls absolutely free for selling only five boxes of our Laxative Stomach Tablets at 25 cents a box. Write to-day and we will send the Tablets by mail postpaid. When sold send us the money. ($1.25) and we will send you the family of four dolls at once. Address,

NATIONAL MEDICINE CO.,
Premium Dept. 134 K, New Haven, Conn.

MARKETS

THE WEEK'S QUOTATIONS.

WHOLESALE PRICES.

NEW YORK, OCTOBER 19, 1901.

GRAIN.—There is but little speculation, and export business is light. There are reports of extensive drought damage to the crop in Argentina.

A CURE FOR ASTHMA.

Asthma sufferers need no longer leave home and business in order to be cured. Nature has produced a vegetable remedy that will permanently cure Asthma and all diseases of the lungs and bronchial tubes. Having tested its wonderful curative powers in thousands of cases (with a record of 90 per cent permanently cured) and desiring to relieve human suffering, I will send free of charge to all sufferers from Asthma, Consumption, Catarrh, Bronchitis and nervous diseases this recipe in German, French or English, with full directions for preparing and using. Sent by mail. Address with stamp, naming this paper, W. A. Noyes, 847 Powers Block, Rochester, N. Y.

BUSINESS BITS.

DERRICK OIL CO., of Titusville, Pa., is offering to sell oil to our readers with the privilege of returning it at the firm's expense if not satisfactory. That seems very liberal and certainly fair.

DURING recent years the pros and cons of dishorning have been very generally discussed editorially. On the outset there was considerable objection to the practice on the part of those who thought it cruel and inhumane. On investigation it has been found that dishorning, when properly done, is both humane and profitable. One of the finest instruments for this purpose is the Keystone dishorner. We advise dishorning because we believe it has a quieting effect upon the animal itself, making it gentler, easier to handle, and consequently, more profitable. The proper season for doing this work is at hand, and those who are thinking of buying would do well to write at once for further particulars. Address M. T. Phillips, Sole Manufacturers, Pomeroy, Pa.

Consumption, Bronchitis and Bronchial Asthma.

Diseases Which Cause Almost as Many Deaths as Consumption.

From Dr. Robert Hunter's Lectures on Consumption.

A cold settling on the chest or grippe that goes down to the lungs produces bronchitis, and when it has continued for several months it becomes chronic bronchitis.

There is at first only trifling cough in the morning with slight chilly feelings, followed by a sense of feverishness towards evening. Walking rapidly or going upstairs cause shortness of breath with a general sense of tightness and oppression in the chest.

As the disease advances the patient begins to raise yellow or greenish-yellow matter; has hectic fever and night sweats and loses in flesh and strength. From this point, unless arrested by treatment, it goes on rapidly, soon exhausts the vitality and causes death with symptoms closely resembling consumption and yet not consumption at all.

By careful observation extending through many years, I am confident that fully TWO-FIFTHS of all the deaths charged to consumption are really deaths by consumptive bronchitis. On examining the sputum and the tissue of the lungs in these cases we find neither tubercle nor the bacilli germs that are always present in TRUE consumption.

This is a most important fact, for bronchitis is much easier to cure than consumption, every case being curable if properly treated. It is only a seated, chronic inflammation of the mucous lining of the air tubes, and at the worst is as certainly curable in the lungs as such inflammation in any other part of the body.

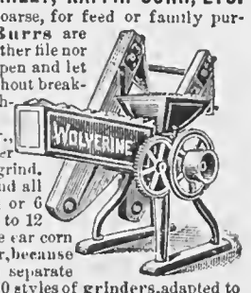
Consumptive bronchitis is not curable by medicine given in the stomach, nor by those hyperdermically injected, for they never reach its seat. It is only by the direct application of medicines to the lining of the bronchial tubes in the lungs that cure is ever effected. The disease is not in the stomach, nor in the blood, but in the lining of the lungs, and THERE THE REMEDIES MUST BE APPLIED.

Nothing but a direct application of healing medicines, antiseptics and germicides to the very seat of the disease will affect the cure of this or any other lung case, and they can be applied only by inhaling them in a gaseous state. The lungs constitute an air cavity, and can be reached medicinally only by medicated air. This treatment was discovered, perfected and first successfully applied by me. It is the only natural, scientific and common-sense treatment ever applied for the cure of bronchial and consumptive diseases. If it fails, nothing else could possibly succeed. But it never does fail, unless mortal injury to the lung structures has taken place before it is applied.

Readers mentioning THE RURAL NEW-YORKER can obtain Dr. Hunter's book, "The Lungs and Their Diseases," absolutely FREE by addressing Dr. Robert Hunter Association, 117 W. 45th Street, New York City.

GRINDS EAR CORN, SHELLED CORN, OATS, RYE, BARLEY, KAFFIR CORN, ETC.

Fine or coarse, for feed or family purposes. Has shake feed. Burrs are made of white metal, so hard that neither file nor tool will touch them. They will open and let nails or hard substances through without breakage. We furnish this mill with or without crushers and elevators.



CAPACITY 10 to 45 bu. an hr., according to power used, kind of grain and fineness you grind. The only mill that grinds ear corn and all other grain successfully. With 2, 4 or 6 H. P. Made in 3 sizes for power up to 12 horse. Guaranteed to grind more ear corn than any mill made with same power, because crusher and grinding plates are on separate shafts, reducing friction. We have 40 styles of grinders, adapted to power wind mills, engines and horse powers of all sizes. We also furnish powers of all kinds for driving all kinds of machinery. Write for our Large Free Catalogue of 15,000 other articles.

Marvin Smith Co., 55-59 N. Jefferson St., Chicago, Ills.

GLENN RANCH,

Glenn County, California,

FOR SALE IN SUBDIVISIONS.

This famous and well-known farm, the home of the late Dr. Glenn, "the wheat king," has been surveyed and subdivided. It is offered for sale in any sized government subdivision at remarkably low prices, and in no case, it is believed, exceeding what it is assessed for County and State taxation purposes.

This great ranch of 40,000 acres runs up and down the western bank of the Sacramento River for 15 miles. It is located in a region that has never lacked an ample rainfall, and no irrigation is required.

The river is navigable at all seasons of the year, and freight and trading boats make regular trips.

The closest personal inspection of the land by proposed purchasers is invited. Parties desiring to look at the land should go to Chico, California.

For further particulars and for maps, showing the subdivisions and prices per acre, address personally or by letter,

F. C. LUSK,

Agent of N. D. Rideout, Administrator of the Estate of H. J. Glenn, of Chico, Butte County, California.

LARGE ENGLISH **BERKSHIRES**—Three young boars fit for service. W. DORMAN, R. D. No. 1, Stanley, N. Y.

Oldest Commission House in New York. Established 1838. Butter, cheese, eggs, pork, poultry, dressed calves, game, &c. E. B. WOODWARD, 302 Greenwich Street, New York.

Apples and Pears

This time of the year we make a specialty of handling shipments of apples and pears, and are now prepared to handle consignments to the best possible advantage. Write us at once for information regarding shipping, etc.; also for stencils.

MARKET NOTES

CHESTNUTS started off at a high figure on account of light receipts and a reported short crop. Conditions seem to have changed, however, and prices have dropped $2 to $3 per bushel, $4 being the highest wholesale figure now. Chestnuts, either raw or roasted, retail on the streets at 10 cents per pint.

DOCK RENTALS.—Owners of shipping pay heavily for the privilege of loading and discharging their cargoes in this city. The last annual report of the Department of Docks and Ferries shows gross receipts of over $6,000,000. Construction and repairs cost about $3,500,000, leaving a net profit to the city of $2,500,000.

ALMERIA GRAPES are now seen in this market in large quantities. They can hardly be said to compete with the California or eastern fruit, as they are distinct from both, and make a place of their own in the trade. They come in small barrels, packed in cork chips, and in this way stand transportation and storage well. An Anchor Line steamer in the Mediterranean service recently brought to this port 17,000 barrels of these grapes, and 3,000 barrels of Greek currants.

BROOM CORN.—It is doubtful whether the price of any other product on the market has jumped up and down so wildly during the past two or three years as has that of the brush from which brooms are made. The sections of the country in which this corn is grown are so limited that a combination of buyers has been able to control it, and force manufacturers to pay enormous prices. At the beginning of this season the price started at $55 per ton. From that it went to $140, and it is not improbable that $200 may be reached. The crop for the past two years has been unusually light.

THE HOP TRADE is dull at present. Buyers are holding off, expecting lower prices, while growers, particularly in the East, are inclined to hold their crop for a time. Hop growers have no adequate organization, and hence reliable crop statistics are hard to get. Local buyers circulate misleading reports, and the grower scarcely knows what to do. In the extensive hop-growing districts on the Pacific coast buyers cannot monopolize things in this way, but in the scattered hop sections of the East a local buyer who is a good talker, has nearly his own way. The exceedingly low prices for several years have discouraged hop growers, and many have gone out of the business.

SUPPLIES FOR SOUTH AFRICA.—Two transport vessels are about to take on 700,000 bushels of oats at this port for Delagoa Bay, and it is said that contracts have been made for 6,000 tons of hay for the same trade. This hay is rebaled and put in about half the bulk, in order to save freight on shipboard, as this is charged by space rather than weight. There is considerable competition for the South African trade. Rates have been cut and business is much depressed. Owing to the conditions in that country there is but little to bring back, and to make the voyage profitable as much must be made on the outward trip as would ordinarily be taken in both ways, as often the returning vessels have to load with ballast.

FRUIT NOTES.—Some dealers are putting the better grades of apples in storage rather than sell at the present prices. A good many medium and low grades are received, as this is the season when nearly all growers are getting rid of the fruit that they do not care to hold. Choice Seckel pears sell as high as $4.50 per barrel, and next in price are fancy Bartletts, of which there are but few offered. Kieffers are plenty, but not many bring over $2. Peaches are scarce. I notice an occasional lot of quinces, but not much interest seems to be taken in them. It is probable that growers who have only a small quantity can do better by peddling them out in their local markets than by shipping to large cities. Many city buyers do not care for fruit that requires so much labor for preserving as the quince. The grape trade is at its height, and prices are running a little higher on all grades.

THE LABOR BUREAU, which has previously been mentioned in this column, is now situated in the Barge Office, Battery Park, instead of at 45 Pearl Street. This is a free employment agency maintained by the Irish Emigrant Society and the German Society of the City of New York, but is free to all nationalities. By sending a stamped envelope to W. H. Meara, Superintendent, at above address, full particulars in regard to the workings of this labor bureau may be obtained. Capable farm hands are always in demand, and quickly find places. There is considerable uncertainty in getting this kind of help, as often a man who starts out well proves to be utterly useless either on account of a surly and stubborn disposition, or habits that make him not to be depended upon; yet some farmers have so much trouble in getting satisfactory help that they jump at anything which seems at all promising, and are willing to overlook disagreeable traits. It is difficult to see just why so many men prefer to dig up the pavements or work in the sewers of this city, continually breathing foul air and living in filthy lodging houses, when they might obtain more agreeable work on the farm, have plenty to eat and more money at the end of the year. W. W. H.

THE WEST THROUGH EASTERN EYES

PART I.

THE SIOUX VALLEY.—On his first trip to the West an eastern man sees many things to excite his interest and to provoke comment. I had my first glimpse of the Middle West as I arose from my berth in the sleeper in the famous Sioux Valley in northwestern Iowa. Here the surface is very uneven. The soil on the hills looks light and infertile; but the valleys are level and productive. As one proceeds north the valley broadens and the surface becomes more level and, if possible, more fertile. Corn, oats, barley and Spring wheat are the principal crops. In early October the corn stood for the most part where it grew, ripened and withered. Husking had scarcely begun. In Iowa one occasionally sees a part of a cornfield cut up and stacked as we do it in the East. This is done when a portion of the stalks is to be used for fodder, but the great bulk of the stalks is never cut. The farmers drive through the fields with a box wagon, and gather the ears from the stalks as they stand in the hills. The stalks are then broken down and plowed under. The other grains are stacked at harvest time, three or four stacks being grouped together for convenience in thrashing. A stack, I was told, would usually thrash out about 300 bushels. Traction engines are used, and the straw is blown up through a pipe or funnel just as the cut cornstalks are delivered by the Blizzard corn cutter. This saves any handling of the straw whatever after it passes through the thrasher. This straw usually remains in the field, and the farmers cultivate around the pile of waste. The more thrifty ones burn it. The cost of thrashing is three cents for oats and four cents for wheat or barley. Some of the work is done by men who own the machinery and make a business of it. In other places a number of farmers club together in joint ownership of the thrasher and engine, and do their own work, and occasionally some for other neighbors. The corn in the Sioux Valley is estimated this year at 85 per cent of a full crop.

FARMING ON A LARGE SCALE.—Some of this land has been cropped for 40 years without fertilizer of any kind. In the older settled regions of Iowa one sees great herds of fattening steers, hogs and some sheep; but in the comparatively new settlements farther north in South Dakota, the live stock disappears, the grain and hay being shipped to market. This verifies the usual observation that new and fertile countries are prone to ship the raw material to market, while the older settlements learn to produce and market the finished product. Farm work is done entirely by machinery, and for the most part by horse power. I met one farmer who owns and operates 23,000 acres of land. He has 14,000 acres under corn this year. He says he would discharge a man whom he found walking at work in the field. Three or four horses are usually used on the plow, which turns two furrows at a time, and the plowman rides. There are no stones to interrupt the progress of the plow, and the furrows behind are as even and smooth as the clapboards on the side of a house.

IDEAS IN CULTURE.—Farmers are beginning to give great attention to surface culture in order to keep the water in the soil and conserve moisture. Some have harrows attached to the plow, so that the surface behind the plow is at once stirred and loosened to prevent evaporation. Others make sure to harrow before dinner or supper all that has been plowed the half day before, and if rain falls before planting time the ground is harrowed again as soon as the rain is over. Drought has little effect on the land where this system is faithfully carried out from the time of plowing as long as the horses and implements can work in the growing corn and other grain. The rich alluvial soil in this valley runs down 18 or 20 inches, with a subsoil of gravel loam. The native grass of these prairies is very nutritious and grows two to three tons to the acre. Alfalfa grows there in great abundance.

J. J. D.

THE native horses of Japan are said to be small and of but little value for any purpose. The Emperor has become greatly interested in foreign horses, and has recently bought from a California ranch a number of fine animals, also engaging an American trainer. Doubtless his example will be followed by many wealthy Japanese, and the result may be a considerable demand for fine horses from this country.

Taxing Cows in Atlanta.

The newspapers report that the City of Atlanta, Ga., is likely to put a tax on all cows furnishing milk for the city. The proposed ordinance has for its purpose the levying of a license tax on each dairyman selling milk in Atlanta, the amount being 8C cents on each cow used in such dairy. It is the intention of the board of health to get this ordinance passed. The effect of the passage of such an ordinance would probably advance the price of milk some, on account of the extra tax, and also because only the licensed dairymen could sell milk. Each person selling milk now has to have a permit from the city, but it doesn't cost anything to get the permit issued. The consumer pays 10 cents per gallon for buttermilk, 20 cents for skimmilk, and 30 cents for sweet milk; this is the usual price. The board of health has inspectors to look after the dairies, as to cleanliness and quality of the milk, so that while the price may be somewhat advanced the consumer is assured of a pure healthful supply of milk. W. M. M.

No such tax has been levied, and I don't suppose it ever will be, though I have not investigated the subject yet. In no event could the city of Atlanta levy such a tax upon the cows of dairymen which are kept outside of the city limits. H. B. T.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

A Cross Clerk

Is a rarity. For the most part the young woman behind the counter is smiling and obliging, though her back hurts, her side pains, or her head throbs distractingly. The wonder is, not that a clerk is sometimes irritable, but that she so rarely shows irritation, when every nerve is quivering and she hardly knows how to hold her head up.

The nervous condition, headache and weakness, which are the results of irregularity or a diseased condition of the womanly organs, can be entirely cured by the use of Dr. Pierce's Favorite Prescription. It regulates the functions, stops enfeebling drains, strengthens the nervous system and promotes the general health of the entire body.

Sick women are invited to consult Dr. Pierce by letter, free of charge. All correspondence private. Address Dr. R. V. Pierce, Buffalo, N. Y.

"Having used Dr. Pierce's Favorite Prescription and 'Golden Medical Discovery' during the past year," writes Mrs. Mattie Long, of Pfouts Valley, Perry Co., Pa., "I can truthfully recommend the medicines for all female weakness. I have used several bottles of 'Favorite Prescription,' which I consider a great blessing for weak women. I was so nervous and discouraged that I hardly knew what to do. Your kind advice for home-treatment helped me wonderfully. Thanks to Dr. Pierce."

Dr. Pierce's Pleasant Pellets cure dizziness and sick headache.

STANDARD HORSE-CARTS.

Twelve Styles—2 and 4-Wheel—Wide and Narrow Tires—Steel Axles. Low rates of freight from our Works - Tatamy Pa.—to all points. Adopted by farmers contractors, miners, gardeners cemetery authorities, etc., wherever the best is wanted.

HOBSON & CO., Manufrs., 19 State St., New York.

$28.50 Buys

Our **No. 13 WOLVERINE** Feed and Ensilage Cutter complete WITH FOUR 13 INCH KNIVES, made of very best tool steel. Our FOUR EDGE CUTTING BAR is made of tool steel and gives four cutting edges without grinding, this is a great improvement over the single edge bar. THE KNIFE HEAD has a double adjustment; the whole head is adjustable as well as each knife individually, always giving a good clean cut. This is not found on other cutters. **SAFETY** FLY WHEEL is furnished and in case any hard substance is fed in machine the fly wheel revolves on shaft, obviating breakage and possibility of accidents. THE STOP FEED lever is in easy reach so feed roller can be stopped instantly. With our expansion gears for driving feed rolls length of cut is varied without changing any gears from ¼, ⅜, ¾ or 1½ in. **CAPACITY** with 2 to 4 h. p. 1 to 5 tons per hr. Handles straw, hay and CORN FODDER, WITH EARS ON. The frame is made of well seasoned hard wood, mortised and bolted. Shaft is 1½ in cold rolled polished steel. Casting made from No. 1 pig iron, therefore tough and strong. **GUARANTEED** to be absolutely perfect; to cut as much or more per hr. as any machine of same size. If not found exactly as represented in every way and equal to cutters retailed at twice our price, return at our expense. WE HAVE NO AGENTS, thus we are able to sell direct to you at WHOLESALE PRICES. We have 47 sizes and combinations of cutters and shredders. Price $1.75 to $110.00, largest cut 25 tons an hr. Swivel carriers any length. WRITE FOR LARGE FREE CATALOGUE.

Live Stock and Dairy

THE CATTLE IN THE PAN-AMERICAN MODEL DAIRY.

Readers of live stock and agricultural journals in the United States have been informed for several months that a so-called "Model Dairy" is in operation on the Pan-American Exposition grounds at Buffalo. The milk for this dairy is supplied from five cows each of the following breeds: Ayrshire, Brown Swiss, Dutch Belted, French Canadian, Guernsey, Holstein-Friesian, Jersey, Polled Jersey, Short-horn and Red Poll. These cows are supposed to be good representatives of the breeds. In part only the breeding associations selected the animals to be used in the test, and neither the American Jersey Cattle Club nor the Holstein-Friesian Association of North America supervised the selection of Jersey or Holstein. These were contributed by the Dominion Government of Canada, as were also the Ayrshires, Short-horns and French Canadians.

These 50 cows have been kept in the Model Dairy building on the Exposition grounds since May 1, and have lived from month to month in the stalls. They are protected from visitors by woven wire fencing, and each herd is in charge of a herdsman who supervises the feeding and care. A record is kept of the daily food of each kind fed each cow; all the milk drawn is weighed and sampled, and tested for its butter-fat content, and various other records are kept to throw light on the relationship of consumption to production. While the original idea was simply to maintain a model dairy at the Exposition, the fact that different breeds supplied the milk, with equal representation in each, soon reduced the trial to a breed contest. This was not at all the purpose contemplated by some of the persons interested. While the Guernseys, for example, have been leaders in the records, Guernsey breeders did not understand that their cattle were to be placed in a breed trial, and did not enter them with this purpose in view. The conditions, however, made it a test, whether the breeder desired it so or not.

The writer has been interested in the work of these cows, and has had the privilege of making fairly careful personal examinations of most of the cows in the barn. This examination convinced me that while the Jerseys and Holsteins were fair specimens of these breeds, without doubt cows of much more capacity than these Canadian cows, in fact, better representatives, could easily have been found in the United States. The Holsteins certainly lacked the general size and capacity of the best individuals of the breed. The Ayrshires are a grand lot, and represent perhaps the choicest collection in the barn of any breed. The Short-horns were fair specimens, but better types of milking Short-horns should have been found in Canada. They certainly are there.

The amount and kind of foods fed the different breeds, depends upon the persons in charge of each breed. The Guernsey people, for example, can feed what they wish, and the Brown Swiss may feed quite differently. The feed for the cows is kept under lock and key in the care of a man who issues it, and charges the same to the cow for which it is intended. A schedule of prices for the different feeding stuffs is adopted, that has a general application to all the animals. A careful study of the official report of the foods consumed by each breed, and the cost of the same, makes interesting reading. In the latest record available at my command (for the week ending September 24) it is shown that all the cows were fed hay, green fodder, silage, bran and gluten. Nine breeds ate cornmeal, six oats, nine linseed meal and six cotton-seed meal. The Jerseys, Brown Swiss, Red Polls and Dutch Belted were all fed these different feeds. No cornmeal was fed the French Canadians, no oats to Guernsey, Ayrshire, Short-horn or French Canadian; no linseed meal to Ayrshire, nor cotton-seed meal to Ayrshire, Holstein, Polled Jersey or French Canadian. The Ayrshire and French Candian during this week had the simplest diet. This week's record showed the lowest cost of food the French Canadian, $4.10, and the highest the Holstein, $6.62.

In feeding the cows, some of the feeders at least study the economy of food, and feed with the view of showing the greatest net profit in butter production, or in total solids in the milk. It did not matter so much what the cost of the food was, if after it was deducted from the value of products, a good net profit remained. The Holsteins are big eaters, but they are also large producers, and this week they made a net profit in butter of $7.28; but the Jerseys made $7.41, the Ayrshires $7.36 and the Guernseys $7.26. Among the poorest records, the Dutch Belted lead with $5.96, with the Polled Jersey next with a record of $5.30. During this week of feeding the Short-horns ate 301 pounds of hay and green fodder, by far the most of any one breed, while the Red Polls ate but 90 pounds. The latter breed, however, consumed heavily of silage, eating 2,122 pounds, the next greatest amount being 1,986 pounds eaten by the Brown Swiss, while the smallest amount, 1,445 pounds, was eaten by the Ayrshires. This shows that the Red Polls ate about 60½ pounds of silage a day per head, while the Ayrshires consumed about 41 pounds. Hay, fodder, silage, bran and gluten are shown to be the staples relied on. Each breed was fed bran fairly heavily, but a wide difference prevailed in the use of gluten. About 1½ pound of gluten was fed each Jersey per day, while five pounds were fed the Holsteins and nearly 4½ pounds a day to the Short-horns. So near as I can figure it out, each Holstein cow ate daily for the week ending September 24, essentially the following amounts of feed in pounds: Hay and green fodder, six; silage, 58½; bran, four; cornmeal, one-half pound; oats, two; gluten, five; linseed meal, 1½; a total of 77½ pounds of which the grain comprised 13 pounds. Such a ration cannot be called a small one, yet it was fed with much profit to the cows, as the records show. The three great standbys with each feeder are apparently, silage, bran and gluten, and all persons familiar with feeding dairy cattle realize that these are the best of foods for producing milk flow rather than flesh.

The best cow of any breed in the matter of profit is the Guernsey cow Mary Marshall, for she has had top rank nearly all the time during the test. The Red Poll cow May Flower is a very excellent worker, and so also is the Jersey, Primrose Park's Pride. The Red Poll breed has surprised some people in the showing they have made, which is very creditable, but it is entirely in harmony with Red Poll records in England and America. One thing in connection with this test that is of interest, is the fact that the Guernseys and Jerseys made the best record at the Columbian Exposition in 1893, the Jersey slightly leading. The writer believes that the American Jersey Cattle Club could have selected cows that would have done much better than those representing the breed at present, animals that could have led in this breed exhibition.

The Model Dairy has been an interesting exhibition, but it really has demonstrated nothing conclusive on the breed question. To be sure it has shown what representatives of the different breeds can do, but it has not been demonstrated that some of these breeds could not do still better, and make records that would cause a general readjustment of the breed rating. One interesting feature of the test is to demonstrate that dairy cows can be kept under very unfavorable conditions, on a fair grounds amid great excitement, and during extremely hot Summer weather, and surrounded by a multitude of flies, and yield a good profit in production over cost of feed. If such satisfactory results can be secured in a place like that at Buffalo, then considerably better returns should be obtained from fairly good animals under suitable home surroundings. C. S. PLUMB.

A Few More Oleo Rogues.

We herewith include list of violations for oleomargarine and condensed milk. Two of the oleomargarine cases were against New Jersey wagon men. In the case of Dunn & Sullivan they forfeited their bail on the day set for trial, their counsel intimating that he was unable to bring the defendants over from New Jersey, as they feared imprisonment. The other seven oleomargarine cases were against storekeepers. The condensed milk penalties were imposed for violations of the branding law. The condensed milk was placed upon the market without having the name of the manufacturer upon its label.

FOR SALE—Holstein-Friesian Bull Sir Tanganoxie No. 26210 H. F. H. B. First Prize Winner. Beautiful animal; good-natured. Age, two years nine months. ORMSBY HILL FARM, E. W. SCHUCHARDT, Mgr. Manchester, Vt.

FOR SALE—Thoroughbred HOLSTEIN-FRIESIAN CATTLE of the best families. Also, 30 high-bred Bulls at reasonable prices. Write the MAPLES STOCK FARM, Binghamton, N. Y., WM. ROOD, Prop

Short-horn and Polled Durham
Calves, must go. Bulls, $26.50; Heifers, $18.50; crated, 3 to 6 mos. SHOEMAKER & CO., Harrodsburg, Ky.

BOZENDALE HERD Brown Swiss Cattle. Calves of both sexes for sale. Milk and butter strain. D. H. COOK, M. D., Albany, N. Y.

Berkshire, P. China and C. White Pigs; all ages; eligible to register, $5 ea. and up. Also B. P. Rocks and W. Holland Turkeys. W. A. Lothers, Lack, Pa

PROLIFIC SWINE—Three sows just farrowed 14, 13 and 12 pigs. The Cheshires are as kind and good milkers as they are prolific. $500 from one sow. Illustrated Catalogue—History of Breed, Methods of Feeding—sent for 2c. stamp. C. E. CHAPMAN, Peruville, N. Y.

Reg. P. Chinas, Berkshires and C. Whites.

Choice Pigs, 8 weeks old, mated not akin. Bred Sows and Service Boars. POULTRY. Write for hard times prices and free circular.
HAMILTON & CO., Rosenwiek, Chester Co., Pa.

Ferrets—Get my prices before buying. Illustrated Book free.
O. E. HEMENWAY, Box R, New London, O.

FERRETS—CHOICE STOCK for sale at all times New book sent free. Address W. J. WOOD, New London, Ohio.

2000 FERRETS. First-class stock. Some Trained. New price-list free.
N. A. KNAPP, Rochester, Lorain Co., O

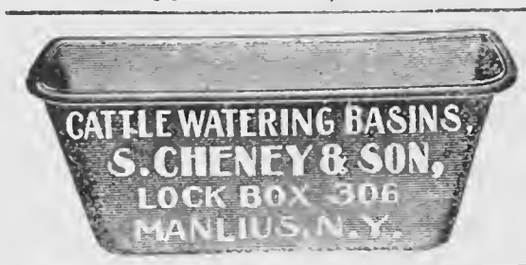
ANGORA GOATS—Delaine Bucks, good stock, low prices. Large circular for stamp. ED. W. COLE CO., Kenton, O.

SHROPSHIRES.
A few Yearling Rams left; they are bargains to quick buyers. Also in lamb Ewes at reasonable prices
J. C. DUNCAN, Wawanund Farm, Lewiston, N. Y.

RAMS—Wool-Mutton, Golden Fleece Shropshires. Special low prices now. Catalogue 47 free. Write to-day.
MAPLEWOOD STOCK FARM, Maplewood, Mich.

RAMS—A choice lot of Delaine and Black-Top Rams and Ewes to select from, will be sold cheap. Correspondence solicited. M. C. MULKIN, Friendship, N. Y.

Cheviot Sheep.
We have 50 Thoroughbred Cheviot Sheep for sale at reasonable prices, both Ewe and Ram Lambs, yearlings and full-aged, that only need to be seen to be appreciated. Good-sized and hardy; all registered in the American Sheep Society.
Eureka Stock and Poultry Farm,
HENRY VAN DRESER, Proprietor,
COBLESKILL, N. Y.



VICTOR INCUBATORS
Hatch every fertile egg. Simplest, most durable, cheapest first-class hatcher. Money back if not positively as represented. Circular free; catalogue 6c. GEO. ERTEL CO., Quincy, Ill.

IT WILL PAY YOU
to send for our new poultry book describing the DANDY Green Bone CUTTER
It tells how to increase the egg yield. The Dandy, the easiest turning of all bone cutters, is sold direct on 30 days' trial. Price, $5 up. Handsome Book Free.
STRATTON MANFG. CO., Box 13, Erie, Pa.

DAIRY AND FARM NOTES.

MORE CORN. — The manufacturer makes his plans ahead; why not the farmer? How many are arranging for next year? "Think not of the morrow." Yes, but we must for successful business. We should have our cropping pretty thoroughly arranged for the coming season, before Winter is upon us. One of the things that at present interests me is the growing of a large acreage of corn for husking, or rather for ear feeding. We have formerly put everything into silos. This year the high price of corn and the great growth with us has given a quantity for hog and horse feeding. Why not raise every pound required for such use? That is just what we shall do next year; the plots are already laid out, and plowing has commenced. Plowing in the Fall? Yes; each year confirms more fully an opinion that Fall plowing in a snowy country is best, giving more time in the Spring for harrowing. In wet seasons the difference in production is not noticeable. In dry seasons it is always in favor of Fall plowing. The furrow slice becomes compacted with the soil beneath, permitting easy and rapid capillarity. As soon as dry enough harrowing begins, which checks loss of moisture. We shall plow until Winter shuts off operations, if not completed before.

Why this increase of grain? I am satisfied that our eastern farms can grow corn as well as the prairie, and the higher price, it seems to me, may remain for a time. That is, I do not look for 40-cent corn again soon. When we could buy cornmeal in quantities at $15 a ton it hardly paid to handle the ears other than in the silo; $25 a ton changes the tune, or even at $20 we should raise our corn. We are now shocking and picking off the ears as fast as needed without husking. The hogs will take care of it, and by the way, corn on the ear is a good horse food, especially for horses after passing the 10 or 12-year mark. When buying I never found one older than that.

THE FARM HORSE.—This idea leads to the most profitable horses for farm work. My mind has changed very materially on this question. I was educated to think that horses had passed their best usefulness at 10 years. I say now that the last half of a horse's life is worth more than the first half. That is, if a horse lives to be 20 years old. His service from 10 to 20 will be of more value to the farmer than from birth to 10. I speak from the standpoint of horses that work hard nearly every day and are driven by hired men. Horses in early life are more nervy and active, but they cannot, if they have not previously been injured, stand as much feed and strain as the more mature animals. Then again, farm work is of such a nature that much time is saved if the horses will stand at the door or anywhere for a moment without hitching. We are keeping these horses as long as they will be useful, and then giving them a decent burial. We have one at the present time 22 years old, which will be given his long rest before this is printed. He could not be bought—faithful old fellow—he shall not have abuse. I bought a pair of horses a few days ago; one of them has galls and collar bunches. When looking at the collars it was all explained; dirty collars. A few minutes each day will keep them clean, and then with a hard, smooth collar—the harder the better—few breasts will get sore. The cheap "sweats" which are sold and used so generally in our section are a curse to horses. They get wet from rain or perspiration, and then, like a wet glove, make a sore. I have cured sore necks and breasts with a new collar of the best quality, without ointments. A noble animal is the horse, but some farm horses are shamefully treated, not only from poor driving and sometimes light feed, but from ill-fitting harness. Have the collar fit close to the neck; if too large cut it down. H. E. COOK.

A Second-hand Separator.

I have a small dairy; keep four cows in milk the year round, as I make butter. I can buy a No. 2 De Laval separator, used a few years, for about $40. A small-sized machine of this make or of any other, can be bought for about $60. Is it policy to get a small machine even for a small dairy? Will it do the work as well and as easily as a larger one? The different parts to the large machine are heavy to handle and clean, and must, I presume, turn harder than a smaller one. Is it advisable to purchase this second-hand large machine, or to buy a new one of the small size for $20 more? Some tell me butter made from separated cream is not as good as that made by the old way of ripening the cream on the pan. What is your opinion? S. D. C.

Fairfield Co., Conn.

Before buying the second-hand separator take a sample of skim-milk from it, and put it through a Babcock test. If it leaves more than one-tenth of one per cent butter fat reject it, and buy a new one, which will have a guarantee with it. The small machines will no doubt be ample for your requirements. Your butter will be of the finest quality if the cream is only properly ripened. Hold cream at a temperature of 50 degrees for two days, cooling each skimming to that degree before mixing. When ready to ripen, warm the whole mass to 60 to 65 degrees, and hold at that temperature until thick; then cool down to 52 degrees; let stand five to 10 hours, according to circumstances, then churn. H. E. C.

The Tenant's Share.

What would be a fair share for me to receive to work a farm on shares in this manner: I have to rent a house close to the farm for $6 a month, and take care of three cows for the people, and do not get any share of the milk from those. The feed for them is to come from their share, and I am to furnish one horse and pasture for the cows in the Summer. They are to furnish one horse all the time, and an extra horse during haying. I am expected to feed the horses that they furnish from my share when I have the use of them. A. H. S.

Dallas, Pa.

In our section on rented farms the tenant furnishes teams and tools, does all of the work; the owner furnishes stock, grass and clover seed, and all other seeds each party furnishes one-half. All concentrated food is paid for one-half by each; everything sold from the farm is divided equally. The teams are usually fed from undivided foods. The conditions in the question seem somewhat peculiar, or else it is not a dairy farm. One cannot advise with much intelligence, not knowing the size or value or producing power of the land. It would seem that you should be paid for taking it, if you are required to pay house rent and take care of stock from which you get no returns; $72 a year is pretty strong house rent. On rented farms houses and all necessary buildings are furnished. Unless you have some income not mentioned in your inquiry better let the job pass. H. E. C.

MY plan of caring for old hens and pullets this time of the year is to give them plenty of corn to start them to laying, and about once a week give them sulphur, about one tablespoonful to 50 hens. Give them plenty of lime, and keep your henhouse yard full of small bits of cracked earthenware. Pound it up fine enough so they can swallow it. Keep them in a warm house, and give plenty of charcoal. That is all I do, and I get plenty of eggs, and have healthy chickens. W. R. N.

BLOATED COWS.—A writer in Hoard's Dairyman gives this experience in relieving cows that were bloated: "We fed Alfalfa hay twice a day, and occasionally we would get some of the third and fourth cutting, that had been frostbitten before harvesting. This would usually bloat two or more, about every time. It was suggested by a veterinarian that I try a one-inch hose, six feet long, by running it down the throat to the stomach, allowing the gas to pass off at once. It requires one man to hold the cow while another puts the hose down. Some cows are damaged by tapping, while the hose in my experience saved many a valuable cow."

HIGHEST AWARD
CREAM SEPARATORS
BUFFALO EXPOSITION.

Just as in the case of every representative exhibition or other contest since the invention of the Cream Separator twenty years ago, the De Laval machines have maintained their supremacy at the Pan-American Exposition, Buffalo, having received the Gold Medal on Cream Separators.

This is the highest and only award of its kind on Cream Separators. The Sharples machines received a Silver Medal. The Vermont Farm Machine Co. received a Gold Medal for its combined exhibit of cream separators, Babcock testers, churns and other apparatus, and A. H. Reid a Bronze Medal for a similar exhibit. With characteristic advertising honestly, the Vermont Company is claiming this Gold Medal to be an award to its "U. S" Separators.

The jury of awards on cream separators consisted of Dr. S. M. Babcock of the University of Wisconsin, the famous dairy authority and inventor of the test bearing his name, and Prof. H. W. Spangler of the Franklin Institute, Philadelphia. This jury awarded the Gold Medal to the De Laval machines, a Silver Medal to the "U. S." machines (Vermont Farm Machine Co.), and a bronze one to the Sharples machines. But the after "pulling and hauling," which unsuccessful exhibitors always resort to in an exhibition contest of this character, finally resulted in the general award authorities granting awards as above announced

In the Model Dairy at Buffalo the work of the De Laval machines was in keeping with their recognized superiority in ordinary dairy practice. Four makers of separators were offered opportunity to set in machines. Two of these, the Sharples and Reid, evaded doing so. Of the third a prominent dairy expert writing under date of October 10th says: "I hear that neither natural gas nor soft coal would make enough steam, so that they had to use wood and coke to run the 'U. S.' machine, keeping water ready to put out the fires that had been started two or three times in the roof of the engine house by the heat from the smokestack,"—the machine being one of those "light" running "dairy" turbines of the make in question, which like the other sizes of such separators run as easy "on paper" as De Laval machines.

OTHER GREAT EXPOSITIONS.

The supremacy of the De Laval machines at Buffalo is a continuation of their triumphant record at all previous great expositions. At the World's Fair, Chicago, in 1893, they received the Gold and only medal awarded by the regular jury of awards and were the only separators used in the Model Dairy. At Antwerp in 1894 and at Brussels in 1897 they received the Grand Prizes or highest awards. At Omaha in 1898 they received the Gold Medal, and again at Paris in 1900 the Grand Prize or highest award.

The Exponent of Advanced Agriculture is

The Practical Farmer, of Philadelphia

American agriculture has made rapid advances during the last ten years. No thoughtful student of the agricultural press can fail to note the progress made, both from the character of the papers themselves, and the results as portrayed in their columns. There have been potent agencies at work to effect these results; agencies which are still at work, and which year by year, are exerting a wider and stronger influence. For the last twelve years, under its present management

THE PRACTICAL FARMER

has been in the forefront of this effort to raise the American farmer to a higher plane of thought, and action, and results. It has aimed at all times to talk to the farmer and not at him, by enlisting men who have made their mark as practical farmers, and bringing their experience and thoughts into its columns. No other agricultural journal has such a corps of writers, who know from experience what they are writing about, as has THE PRACTICAL FARMER, of Philadelphia, and it has also had the good fortune through its foresight and management to bring into its column from week to week, and year to year, the experiences and practices of thousands of the best and most successful farmers, stockmen, gardeners, and workers in other departments of the farm. By this happy combination of the leading practical Agricultural writers and the plain farmer who tells at night what he has done through the day, THE PRACTICAL FARMER has won the confidence of its readers as it could have done in no other way.

We are glad to be able to announce that

PROF. W. F. MASSEY,

who has been a force in advanced agriculture for two score years, has resigned his position in the North Carolina Agricultural College to assume editorial charge of THE PRACTICAL FARMER, writing exclusively for its columns. What this means for our readers, those who have been conversant with the rich results which have followed Prof. Massey's labors well know. It means a broadening of every department of THE PRACTICAL FARMER. Of the counteracting of any tendency which it may have had or does have to get into ruts. For twelve years it has worked week in and week out to lift the American farmer out of the ruts, and if there has been any tendency to get into a rut itself, Prof. Massey will have the ability and authority and financial backing to lift it out. Every department will be vitalized; new blood, new ideas, new methods. The whole paper will feel the uplift. The men who have shown such skill in the editorial management of the Special Departments, will still retain their management, but the whole will be under the supreme control of a master mind, and every department will respond to that control.

Second only in importance to the acceptance by Prof. Massey of the editorial management, is the engagement of **Mr. A. F. Hunter,** for ten years editor of Farm Poultry, to look after the Poultry interests of THE PRACTICAL FARMER. Mr. Hunter is recognized as one of the ablest authorities in the United States on all subjects pertaining to Poultry. His practical experience and thorough observation in this country and Europe give the assurance that the Poultry interests of the paper will be brought up to and maintained at the very highest standard.

MR. T. B. TERRY, of Ohio,

who writes exclusively for **The Practical Farmer,** of Philadelphia, will continue to make the front page of THE PRACTICAL FARMER the strongest page in the Agricultural Press, the index of the good things which follow that page. No other man is fitted to exert just the same influence. Year by year his Institute work, covering almost every section of the country, broadens him and brings him into contact with almost every known need and experience of American Agriculture. Thus, both by his own experience and success, as well as through the experiences and opinions of thousands of farmers against whom he personally rubs through the Institutes, he brings to his weekly articles a strength which makes them unique.

His book, "Our Farming," is the most successful agricultural book ever published. A complete record of his farm work, covering a quarter of a century. Contains 368 pages, beautifully printed, handsomely illustrated and cloth bound. As noted at the bottom of this page, we give a copy of this book free to any person sending us a club of six yearly subscriptions to **The Practical Farmer,** of Philadelphia, at 50 cents each.

One of the most potent factors in the power which THE PRACTICAL FARMER has exerted in advancing agricultural practices, is the **Special Departments,** which are peculiar to it. THE PRACTICAL FARMER struck a popular chord, and its Special Departments met with an instant success, which the years increase. There is a reason for it, too. They were especially intended to bring out the common farmer; the man who stands back of American Agriculture, and makes or unmakes it. To print his experiences; to give place to his opinions; to enable him to come into contact with his fellow farmer, and to evolve from that contact the mutual help which should bring better results: following these lines,

Our Experience Pool will remain under the direct editorial management of Prof. Massey. These weekly discussions of subjects connected with farm crops and stock, and their management, under his skilful direction, have proven very popular. The topics are selected with special reference to their adaptation to the ordinary farm and garden routine. Fifty-two of these topics are discussed each year by the thousands of subscribers of THE PRACTICAL FARMER, who bring to the discussions the experience and knowledge gained from their daily work as related to the topics discussed. The discussion in each pool is carefully summarized by Prof. Massey, the main points being developed and practically applied. 50 cents is paid for the best (which will be at head of column) and 25 cents for each other article published.

Short Cuts by P. F. Subs., tell of the thousand and one ways by which the successful farmer and his housewife achieve their success. Every one knows of a short way of doing some certain thing. Every week some of these short ways find a place in Short Cuts, and the thousands of readers who did not know those particular ways can do them too. The ability to make one's work tell; to achieve results at the least expenditure of time and labor, is what commands success. Short Cuts tell how it can be done in thousands of ways on the farm and in the home. This department is under the editorial charge of Mr. T. Greiner, an expert in short cuts himself, and thoroughly alive to the possibilities for usefulness of such a department. 50 cents is paid for the best and 25 cents for each other article published.

Farm Implement Annex has to do with the selection, care and use of farm machinery. In these days the farmer who does not avail himself of every help which inventive genius supplies, and which he is able to get, will be left in the race. Larger production from fewer acres is the secret of success on the farm, and farm machinery is a potent help to bring it about. But the machinery needs to be oiled with brains, and Farm Implement Annex is designed to help its readers do that. Judgment in the purchase and use of farm machinery, and care in its management will bring success. The collected experiences published in this department make a trustworthy guide to its readers. A cash prize of 50 cents is paid for the best and 25 cents for each other contribution published in the department.

Mistakes, Failures and Successes. The first two of these words strike a tender spot. We like to tell how we succeed, but to tell of a failure is like pulling teeth. And yet to arrive at correct conclusions it is just as necessary to know of the mistakes and failures as of the successes. The first two warn you from, and the latter points to certain things. And so the aim of this department is to collate both the mistakes and the successes of the readers of THE PRACTICAL FARMER. We honestly believe that thousands of its readers have been saved from failure and loss by the experiences which their fellow farmers have contributed to this department. The successes admirably supplement the failures and mistakes, and very often the writer tells how through failure he has won success. We pay a cash prize of 50 cents for the best and 25 cents for each other contribution printed in this department. Both the Implement Annex and the Mistakes, Failures and Successes Departments are under the editorial charge of Geo. T. Pettit, who keeps both of them fully up to the progressive ideas and ideals which are embodied in THE PRACTICAL FARMER.

Postal Card Correspondence are reports from all sections of the United States and Canada, with an occasional contribution from other countries. The state of the crops, prices, local advantages are clearly and succinctly set forth. It is a bird's eye view of matters and things which it is important that the farmer should keep posted upon. It gives a general and accurate idea of crops and prices. 25 cents is paid for each contribution published.

These five departments are maintained exclusively by contributions from subscribers of THE PRACTICAL FARMER. They form a sort of a Free Parliament, where the members of THE PRACTICAL FARMER family can meet and exchange ideas and experiences. While the articles are pruned and put in shape by skilled editors, the ideas are the result of practical, every day work right on the farm and in the home.

Another feature peculiar to THE PRACTICAL FARMER is its

CROP SPECIALS

The whole front part of the paper of a given number is devoted to the discussion of some certain topic; the articles being written by subscribers of the paper. Several of these are printed during the year, and the aim is to discuss leading matters that interest the whole country, or large sections of it. Cash prizes of Twenty-five, Fifteen and Ten dollars are paid for the best three articles contributed to each Special. We have arranged thus far for the following Specials:

Incubator and Brooder Special, December 21.
Tobacco Special, January 18.
Dairy Special, February 22.
Commercial Fertilizer Special, March 22.
Farm-Garden Special, April 19.
Ten Year Experience Pool Anniversary, May 24.
Clover Special, June 28.

Cream of the Bulletins is another thing original with THE PRACTICAL FARMER. Each week a bulletin of some Agricultural Experiment Station is taken and its facts and conclusions stated in plain English, so that in a short space the cream of the bulletin is skimmed off and dished up to our readers. The subscribers of THE PRACTICAL FARMER get an intelligent idea of the most important Bulletins, State and United States, published during the year.

Veterinary.—Dr. A. S. Alexander, a skilled veterinarian, answers free, through this department, all queries relating to the diseases of all kinds of live stock. The questions are given in full, so that subscribers who wish to minister to the ailments of their animals, can often find in the numbers of THE PRACTICAL FARMER the advice they need without any delay. It is safe to say that this department has saved thousands of dollars to our readers.

Queries.—Sometimes the answer to a single query will cost twenty-five dollars to the management, but not a cent to the inquirer. The aim is to answer fully every query sent by subscribers on all subjects concerning agriculture, stock, garden, horticulture, poultry, and related subjects, and in such a manner that the answers are of general interest, and a means of information to the general reader, as well as to the particular person for whom the answer is printed.

The Home Circle is especially attractive in the home. Mrs. Velma C. Melville has had years of experience in this work and caters successfully to the highest moral tone of the farmer, his wife and children. Through its columns the farmer's wife and daughter chat with their neighbors a thousand miles away, and inspire a community of feeling and purpose which helps to cement the sisterhood of women.

The General Departments are such as are found in all live agricultural journals. The Agricultural, of which the weekly letter of Mr. Terry furnishes the backbone; the Garden Department under charge of Mr. T. Greiner, a gardener and writer of National fame; the Stock, of which Dr. Galen Wilson has charge; the Horticultural, with Mr. Joseph Meehan at the head; Poultry, under the wing of Mr. Hunter, are of the most practical character. Indeed, it may be said that the distinguishing characteristic of THE PRACTICAL FARMER is the intensely practical nature of everything which appears in its columns. All the articles are prepared expressly for its columns, by writers who, from their own experience, know and appreciate the needs of the soil-tiller, and write with the consciousness of that need permeating their work.

These are the lines along which THE PRACTICAL FARMER will be conducted during 1902. But it will not stand still. The coming year ought to, and we believe will, mark a note-worthy advance in American Agriculture. That must keep pace with the improvements made in every other business and profession. It will be the aim of THE PRACTICAL FARMER to lead that advance.

$1.00 **$1.00 pays for The Practical Farmer from now until January 1903.**
$3.00 pays for a club of 6 subscriptions to THE PRACTICAL FARMER from now until January 1, 1903, and a copy of Mr. Terry's book, "Our Farming," to the club raiser. **$3.00**

All Subscriptions Discontinued on Expiration. Remit by P. O. or Ex. Order, Bank Draft or Registered Letter, and address

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. LX. No. 2701. NEW YORK, NOVEMBER 2, 1901. $1 PER YEAR.

FEEDING STUFFS FOR THIS WINTER.

THE CHEAPEST FOOD TO BUY.

How to Use Roughage.

As this has been an unfortunate crop year in certain sections of the country the question will naturally arise with many, what feeds can be used most profitably where they are both scarce and high in price? One can only offer suggestions, and these may have an application in some regions, and will not do nearly as well in others. Yet where money is to be expended the suggestions may have a wider application. For the Central West hay and fodder will not be especially scarce. The severe damage to the corn crop was to the grain rather than the stalk and leaves, although the supply of fodder will be far short of an average. Yet the crop of early hay was quite generally good, and corn stover will be abundant in the Mississippi Valley, if the product of the fields is utilized. Hundreds of thousands of acres of corn stover have each year in the past gone to waste, by standing uncut through the Winter, to be plowed under or burned in the Spring. The past season's drought may result in saving a large percentage of this year's forage. An acre of ordinary corn stover contains about 1,600 pounds of digestible food, and if there is but half a crop, there will be perhaps half that amount. A thousand pounds of field-cured corn stover contains 20 pounds of digestible protein, so the reader can readily see that there is nourishment in the plant, even if the ears are gone.

Pork can be fed with good profit this coming season. Live hogs have already passed the seven-cents-a-pound figure in the West, and corn and shorts at present prices will let one have a liberal margin on the cost of production. Even though the price of grain is high now, this is the season of golden harvest for the man with a good bunch of pigs. Grain may be bought at a distance and shipped in, and considerable money saved in many localities. Minneapolis and Chicago; Cincinnati, Louisville, Pittsburg and southern cities have responsible dealers in feeding stuffs, from whom samples and prices can be secured. Correspondence may save many dollars to some farmer about to lay in a Winter supply of feed. It will no doubt be wiser to buy now what is needed for the Winter, than buy from time to time, for prices may be expected to rise rather than fall, so good judges report. The writer has recently purchased a carload of bran and shorts. These were shipped 600 miles, and delivered here from Minneapolis at $17 for the bran and $18 for the shorts or middlings. I also bought five tons of gluten meal, which cost delivered $26.50 a ton. Of late I have bought some hominy chops at $20 a ton, and shelled corn at the rate of $25 a ton. Analyses show that these contain the following amounts of digestible foods in 1,000 pounds:

	Dry matter.	Protein.	Carbohydrates.	Fat.
Bran, Spring	885.	129.	401.	34.
Shorts	882.	122.	500.	38.
Gluten meal	918.	258.	433.	110.
Hominy chops	889.	75.	552.	68.
Corn	891.	79.	667.	43.

A study of this subject will show that on the basis of valuable food nutrients secured the gluten was by far the cheapest feed. Protein is the most costly material secured in our feeds, and the gluten is specially rich in this material, yet it cost almost the same as the corn. The fact of it is, that gluten is really one of the cheapest foods one can buy. Dairy cattle in particular respond to its influence, and our cows do their very best when fed this food. But one does not want to feed all gluten. Bran is a peculiar feeding stuff. It seems to have a laxative, cooling effect on the bowels, and while it supplies a fairly good per cent of protein or muscle-making food, it also keeps the digestive system in good condition. No other grain seems quite to take the place of wheat bran, and so it should always be used to some extent with cattle. Bran and shorts are much alike in composition, but shorts I especially prefer for the pigs, giving the bran to the horses, cattle and sheep. Old pigs may be fed bran if desired, but shorts handle nicer, and are not so irritating to the digestion of pigs, and young ones in particular.

The hominy chops can be bought at hominy mills or in the market in many places in the West. This makes a most palatable meal for cattle and pigs, and it has essentially the same composition as corn, although there is rather more fat in the hominy than in the corn. In making up feeding rations, variety is relished by animals, and better returns may generally be expected where a variety is fed. And if one has to buy anyhow, then why not buy several sorts? We must take palatability into account in feeding our stock. The chemical analysis is only an indicator of value in part. The taste in the mouth affects animals as well as man. And so I find, in the fixing up

A PAIR OF WELL-BRED FARM BABIES. FIG. 333.

of these feeding stuffs, that some cornmeal along with the gluten gives an additional flavor, and further helps to balance the ration up. Gluten is very rich in protein, and an animal should not eat of this feed heavily. So in place of gluten some cornmeal or hominy may be substituted if feeding cattle, and a better balanced ration made. A ration of 25 pounds of stover, three pounds of gluten, four pounds of cornmeal and four pounds of bran, would cost about 15 cents on the basis of the above prices, and would be well adapted to a dairy cow of 1,000 pounds or less. Of course, the amount of grain fed depends on production. This amount will do for a good milker making say three gallons a day. A fattening animal would need less rough feed, more cornmeal and less bran.

The economical carrying of horses through the Winter should not be a difficult problem. On many farms where work is light, good clover hay, moistened, will give first-rate results alone, with no grain. This the writer has given a good Winter trial, and T. B. Terry's experience in keeping horses on clover hay alone has been much quoted in the past. For several Winters we have fed our horses shredded corn stover with excellent results, plus a light feed of oats. The horses relish good bright corn stover for a change, and keep up on it in a surprising manner. At present we are feeding 1,300-pound horses on four quarts of oats three times a day, and Timothy hay, with three-fourths of a pound of oil meal once a week, as a conditioner, but soon the oats will be reduced, and a cheaper diet fed. We must get the cost of our horse feed down close to 10 cents. If 15 pounds of stover are fed, at $2.50 a ton, and 10 pounds of oats at 32 cents a bushel, then the horses will do nicely, and the feed will cost but about 11 cents. As the work is increased the feed may be increased. One can easily tell how horses are doing by the way they respond to work, and the way they appear in flesh. In Winter some bran may also be substituted for oats. The New Jersey Station found that it could substitute brewer's grains for oats and save money. Oat rations at prevailing prices cost 24.3 cents a day, while rations with dried brewer's grains substituted cost 19.4 cents. To 1,000-pound horses this Station fed six pounds of hay, two of bran, four of unground corn and eight of dried brewer's grains.

For sheep a feed of clover hay or Alfalfa, with a light ration of bran or wheat screenings, with a bit of oil meal is desirable. In some regions wheat screenings can be bought very cheap, and while they do not represent any fixed feeding quality, they as a rule are most excellent for sheep, and give good returns. I have bought them all the way from $8 to $20 a ton. Sheep relish them greatly, and one can afford to pay a good price for high-class screenings. Oil meal or oil cake seems a most excellent food for sheep in a small way, giving a finish to the wool, and condition to the skin and eye of the desirable sort. Sheep also relish oats, and these feeds are all staples. Ample good hay, a pint of oats daily and an occasional bit of oil meal, will keep sheep thriving. Ewes at lambing should also have some bran, while fattening sheep would do better on corn than oats. At present low prices on sheep, one can hardly afford to spend much on stock animals, unless sure of a select market. Stockers should have plenty of good hay of some sort, and then be fed grain on the most economical basis, according to local surroundings. Screenings will probably be cheaper and better than corn. Finally, if you feed at all, feed only superior stock, that will more than pay for their keep.

C. S. PLUMB.

R. N.-Y.—We find wheat bran one of the most useful feeds for all kinds of stock. This year oats seem to be the most expensive feed that eastern farmers can buy.

A SHETLAND PONY COLT.

About two years ago I invested in a pair of Shetland ponies, with the idea first of pleasing the little boys, and secondly, I thought they might be profitable to raise for market. I send you a photograph of the first pony bred and raised at Hickory Hill Farm, shown at Fig. 333, with his young master, Harold Morse, aged three. This colt's dam was less than three years old at the time the colt was foaled. She is 38 inches tall, and weighs about 300 pounds. At birth the colt weighed 27 pounds and was 22 inches tall. As far as we have found, the purebred ponies are very docile and safe for the children. A very good illustration of this was an incident that occurred two days after this colt was born. I had turned the mare and colt in the back yard, and soon after we missed Master Harold. We found him in the attitude in which he appears in the picture. The mare was standing close over them, very watchful, but not at all inclined to be cross. This little mare is not a "fish-cart" pony though, by any means, and can draw the two older boys, aged eight and 11 years, five miles

an hour, and has made one trip of 20 miles in a day this Fall.

The boys have broken a two-year-old this Summer to drive to the cart, and it is hard telling which learned the more, the boys or the pony. I also have learned a few things about ponies and some about men also. I have found that some of the mares are non-breeders, and also that it is well to have a certificate of registry come with the pony, or he may grow, and grow, and grow, until he is just an undersized little horse, too small for a horse and too big for a pony. Dealers in this class hurt the sale of real ponies, because they offer their stock at low prices, and cause dissatisfaction among those who buy.

J. GRANT MORSE.

THE "HICKORY HORNED DEVIL."

I found the large worm I send you in my yard, crawling on the ground. Will you inform me as to its name and nature? Upon what does it feed? Does it ever damage trees or plants? C. S. D.
Barnesboro, N. J.

The "large worm" proved to be rather a "rare bird" among the caterpillars. It seemed willing to pose for its photo, and I think many readers of THE R. N.-Y. will be interested in the result, as shown in Fig. 334. Is it not a formidable looking creature? And yet it is perfectly harmless to man, but it can eat a large number of leaves of various trees and shrubs, its favorite food being hickory and walnut. However, it has so many enemies among the parasitic insects and the various insect diseases that it rarely multiplies in sufficient numbers in any locality to be considered a pest; it usually only defoliates a shrub or small tree here and there. The general color of this frightful caterpillar is light green, with the black and white spots shown in the figure; the long horns are brown tipped with black. C. S. D.'s caterpillar was full-grown, and would have soon burrowed into the ground and in a few days transformed into a brown, lifeless-looking object called the pupa stage. This pupa would have wintered over, and some time in June next one of the most magnificent of our moths would have emerged. This moth has a wing expanse of five to six inches. Its front wings are of an olive-gray color, adorned with several yellow spots, and veined with broad red lines; the hind wings are orange-red with large patches of yellow. This truly regal insect was aptly named the "Regal moth" (Citheronia regalis). But its ferocious-looking caterpillar is popularly known by the expressive name of "Hickory horned devil." It is a "rare bird" in New York, but more common southward and eastward.

M. V. SLINGERLAND.

NEW MARKET FOR APPLES.

There are some faint-hearted people yet who do not understand what can be done by an organization like the American Apple Consumers' League. We wish to call their attention to the following letter from the proprietor of Dorlon's Restaurant in this city:

"I have been told that my father once ate 18 apples in a day. Hence my daily average of three or four is not too much, if there is anything in heredity. I have been in the restaurant business over 25 years, and never (strange as it may seem) sold an apple on my tables until about two years ago, when I commenced to read THE R. N.-Y., and was particularly attracted by your articles on apples. A friend of mine, a clergyman, said to me at that time: 'Why can't I get some apple sauce here?' THE R. N.-Y. and the clergyman decided the question. I told the steward to buy a barrel of apples, and I have never been without them since, and I made my friend a member of the Baked Apple and Apple Sauce Association.

"I have great difficulty in buying the kind of apples I want. Except the Long Island Newtown Pippins, which we have great difficulty in getting, the Spitzenburg, I think, is the best for baking; the Rhode Island Greening, the best for cooking and apple sauce. (Oh, how good it is!) I think packing in boxes is a very great improvement on barrels, and while the cost is a little more the waste is less. For my table I must have quality and uniformity. I can afford to pay a good price, for I get 15 cents for two baked apples and a pitcher of cream, and my customers pay it willingly, in competition with a Ben Davis at 10 cents for two great big apples. When people do make a comparison I simply tell them that I pay $7 a barrel, and can buy the Ben Davis for $3. Of course, up to this time it has not become a very large part of the business, but it certainly is increasing. I think we use for baking and eating raw about a barrel a week, and for sauce and stewing another barrel. I expect this Winter to use more. I am using now for eating apples, what is called a Spitz, for which I am paying 15 cents a dozen. Go ahead, brother, give us a good flavored apple, uniform in size, and convenient packages, and you will have done more for prosperity than many men with their millions."

W. H. CAPEN.

There is only one instance of what a few words will do, yet it means 100 barrels a year extra. Not only that, but every dish of those fine baked apples is an educator. People eat them, and then go to other restaurants, or go home, and demand the same quality. All this surely increases the trade in fine fruit. It is only a hint at what may be accomplished if those who are interested will only make *apple eating* popular. We must educate those who live in town and city to eat apples as freely as the fruit is eaten in the farmer's own family. The way to do this is to talk it up, and thus create the impression that apple eating is fashionable. In the southeastern corner of New York State there are nearly 5,000,000 people, most of whom do not know a good apple when they see it.

DEER VS. FARMERS IN VERMONT.

Which Does the State Prefer?

THE R. N.-Y. feels somewhat responsible for the following case. Several years ago we were asked for an opinion regarding the chances for apple growing in Vermont. We collected the best information we could find regarding markets, varieties and culture. The inquirer went ahead with his orchard, but now it seems that a new enemy appears upon the scene—one that cannot be fought successfully with spray pump or gun!

Deer Worse than San Jose Scale.

I have purchased a farm about one-eighth mile from quite a village, and directly on a stage road. I purchased it for the purpose of raising fruit, particularly apples, plums and cherries. I supposed all I

THE WELL-NAMED HICKORY HORNED DEVIL. FIG. 334.

would have to fight would be bugs, weeds and such vermin. I set out a lot of trees two years ago. Last year they grew finely, and put on nice tops. This year the deer came in in droves when the new growth had pushed out about a foot, young and tender, and literally cleaned it up. I then tied some colored cloths to the trees, and that kept them off until now. Now they are eating last year's and this year's growth, and I expect next they will bark the trunks. There is a good chance for fruit growing here; the quality is of the best, and the market close by. I wrote the Fish and Game League, an association run in the interests of the railroads and sportsmen, and they replied that they would prosecute me if I touched one of their deer out of season. The "season" is one male deer to each hunter in the last 10 days of October. This is not an isolated case, but is happening all over this part of the State (Windsor Co.). Only the old timers know enough not to try to raise fruit trees. They eat one's corn, turnips, beans and lodge down the farmer's clover. They eat all the apples they can reach, and they can stand on their hind legs and reach 10 feet, as I have seen them do while sitting on my front porch. As a deer preserve Vermont is becoming a grand success, but an enterprising farmer would better keep away. Now I cannot protect my crops without calling down all the powers of the State on my head. FRANK HOWARD.

The Vermont Law Expounded.

That is what we call pretty dear experience. Mr. Howard wrote to the Fish and Game Commissioner of Vermont, and received the following enlightening letter. The man who would not write forcibly when he saw his trees being pruned in this way has no business ever to raise an apple:

"I am not much of a farmer, but supposed that if the country you named was good for farming and especially for fruit growing, it would not be allowed to go to waste. Of course, one must adjust himself to the conditions and laws of the State, both natural and legislative. The last paragraph of your letter, while not explicitly so stating, intimates that the deer law is not favorable for your business, and, therefore, you propose to get rid of the deer. Before reading that paragraph, your letter intimated too much common sense to make any threats. I have no doubt that the deer damaged your crops, and that it will not be a favorable place for raising fruit in the vicinity where you have set out your trees. The Vermont Legislature is supposed to represent the will of the majority of the people. To violate one of the acts of the Legislature because you disapprove of it is not good citizenship. I, of course, so far as I am concerned must see that you do not violate the law protecting deer, and if you do violate it must see that you are prosecuted. I suggest that the better way is to be a law-abiding citizen, and if your crops have been damaged appeal to the Legislature to reimburse you." JOHN W. TITCOMB.

The Facts in the Case.

We have been at pains to investigate this matter. Our reports show that deer certainly do considerable damage—especially in the hill towns in the northeast part of the State. In the thickly settled parts little if any damage is reported. The majority of those who have written us do not think the present fish and game laws of Vermont are fair or helpful. One man writes that the greatest nuisance comes from the danger of being shot by the hunters in the open season. Cows and other stock, and even children, have been hurt in this way. The following statement is sent us from Rutland County:

"Deer and other game do no perceptible damage to crops in this part of the valley of the Otter Creek, which is at the western base of the Green Mountains. I am informed, however, that deer do destroy crops on the heights, where there are smaller cleared lands adjoining dense forests, and the owners of such tilled lands do complain bitterly of their depredations. No other game is complained of. There is no particular increase of any game except deer, and I think fish is even more scarce since the fish and game laws were enacted than before. The law operates like the prohibitory liquor law, which makes every boy and young man want whisky. Every man or boy who ever handles rod or gun goes as wild as the game when the open season commences."

On the other hand, a good farmer well acquainted with the central part of the State, says:

"Some farmers kick about the deer because it is an easy thing to kick about. The Potato rot has done something over $100,000 damage this year, most of which might have been prevented without any change in the game laws. But most of the farmers prefer to let the Quack grass and rot fight it out in the potato patch. It is easier. They don't kick about that, because they can't blame anybody else. The deer will not do one five-hundredth the damage this year that the Potato rot does. Further than this it seems to me that the agitation for a change in game laws is largely a waste of energy, simply because the present game law is practically a dead letter as regards deer. A farmer can go and shoot all the deer he wants to, and there isn't a police officer in the State who can get a case against him. What sort of a game law would help keep the deer out of the farmer's orchard?"

SOME NOTES FROM OHIO.

There is practically no clover seed grown in this county, and I might say the whole Western Reserve. Cow peas are gaining in favor every year. In 1895 I was the first to try them, and now they are to be seen on nearly half the farms. The large firm of Storrs & Harrison Company plowed under 60 acres of them last year, and I notice many other smaller nurseries are using them also. They had never used any, but had tried Crimson clover with only partial success, and were using millet largely to plow under. Now the cow peas have taken its place. I am interested in the articles on chemicals and clover in THE R. N.-Y. Crimson clover, though, is a most uncertain crop, although I have never sown it in corn as described. I think if we were sure of good northern-grown seed perhaps our efforts would be more successful. This section is largely devoted to onions, grapes and this year an immense peach crop; the first to amount to anything, as there have been many peach orchards set along the lake in Lake County. Last week we got off the last of 2,500 bushels. I doubt whether there will be many set next year, as the prices have been so extremely low, and many orchards proved to be untrue to name. Quite a number of farmers bought of an Ohio nursery and orchard company exposed in THE R. N.-Y. They are surely very unreliable. I could furnish any amount of evidence against them. It's a pity growers can't get some satisfactory damages from nurserymen. When one buys from 1,000 to 2,000 trees for the best yellow stock, and after four or five years of care and tending finds that they are 95 per cent white ones, with 50 per cent of those a miserable cling at that, it is enough to fill one with murderous feelings. In a block of trees if a few should be off in name it is overlooked, but to have them all like these it is clearly fraud and intentional. L. W. K.
North Madison, O.

EXPERIENCE WITH COW PEAS.

Their Use in Central Ohio.

During the season of 1900 I had six acres of Black cow peas, put on ground that had been grained for several years, wishing to keep up its fertility, and to learn whether the cow pea would thrive and mature in central northern Ohio. They were drilled in with an ordinary corn drill three feet 10 inches apart; closer rows might have done as well or better, cultivated several times during the season. At first they grew slowly, but later, when drier and warmer, they seemed to thrive much better, and matured quite a crop of pods filled with peas, but not as great a crop as I had expected, being from two to eight pods where the bunches of blossoms set little stubs or stems for many more. They were quite tedious to gather (we may not have known how to do it to the best advantage), it being difficult to supply the requisite amount of help at this busy season. We came to the conclusion that the cost was more than the benefits derived, and concluded not to grow any more.

In the Spring of 1901, on coming to the farm I found the tops had been gathered together (instead of being plowed down) with a view to burning them to get in early a seeding of oats. I stopped the burning, directing their being hauled to the barnyard to be tramped in with the manure. On their getting there (there were 14 large loads of them) the cattle and hogs began to eat them with avidity. Some were thrown to the sheep, and they, too, enjoyed them. It is needless to say that they were kept and fed as fodder, and not tramped in with the manure. We gathered and gleaned from this patch 63 bushels of heavy oats to the acre, while the general average of the county was not 30 bushels. Our average from about 100 acres was not so great. The ground was plowed for wheat last Summer, breaking up mellow and nice for a seed bed. I shall report on harvesting wheat whether there is any difference in the yield from this part of the field. I did not find on the roots of the cow peas during their growth or afterward the nitrogen-gathering tubercles I had hoped for. Had they been present would we not probably have a better yield of peas? The fine yield of oats will encourage our trying them again. I shall get the Whippoorwill cow pea the next time, as I understand it matures earlier. G. W. G.

Columbus, O.

R. N.-Y.—We have been careful not to advise northern farmers to attempt to make hay of the cow-pea vines. Such instances as the above show that stock will eat the vines, but they are hard to cure, and in our own practice we find it better to plow them all under for green manure. The increase in the oat yield appears to be due to the cow peas, and had the vines all been plowed under the yield would have been larger yet. We think that the wheat also will show the effect of the cow-pea crop. By using a variety like New Era, another crop of cow peas could have been grown between the oats and the wheat, and if a small amount of fertilizer had been used with the peas the vines would have benefited the wheat nearly as much as a fair dressing of manure. In Delaware and States farther south this short rotation of cow peas between crops of small grain, with the fertilizer on the cow peas is very profitable.

It is not unusual to find no warts or nodules on the roots of cow peas when they are grown for the first time. That has been our experience, but invariably these nodules have appeared in increasing numbers, as year after year the crop continued to be grown. The explanation of this is quite simple. At first the special bacteria which cause and occupy these nodules were few in number. They were brought to the soil on the cow-pea seed. The first year perhaps there were not enough of them to make a fair showing, but as other crops of cow peas were grown they multiplied and did their work. We have found that these nodules are more likely to form when the cow peas are grown in poor soil containing but little available nitrogen.

Good Results in Michigan.

Feeling under obligations to THE R. N.-Y. for giving me information on the growing of cow peas, I am glad to give my experience with them, hoping it may interest others. About the middle of June I sowed four acres of Whippoorwill peas; these were put in with a beet drill used by sugar-beet growers. The drill sows four rows 21 inches apart. I used about 12 quarts of seed per acre. The land is thin and sandy, and the season with us was unusually hot and dry, but in spite of these unfavorable conditions the peas grew to an average height of perhaps 16 inches—about as large as I could turn under without trouble. They were cultivated three or four times with a weeder; this, with a few teeth taken out, covered the four rows sown by the drill, and made short work of cultivation. The roots were well supplied with nitrogen tubercles; as well, I think, as clover grown under same conditions would have been. Part of the field received a light coat of manure, and the difference in the growth of the peas was most marked. This leads me to think that while they can rustle for a living on light soil, they appreciate a full meal as much as other crops. Some of the peas were cut and given to the horses green, but they utterly refused to eat them until forced by hunger, so I decided to stick to my original intention and turn them under as a fertilizer, but first we cut and cured a small load for hay, and this the contrary horses eat in preference to Timothy. Now when I reflect that I turned under what would make 16 tons of hay worth $12 per ton, I feel that I have a rather costly fertilizer. L. W. R.

Benton Harbor, Mich.

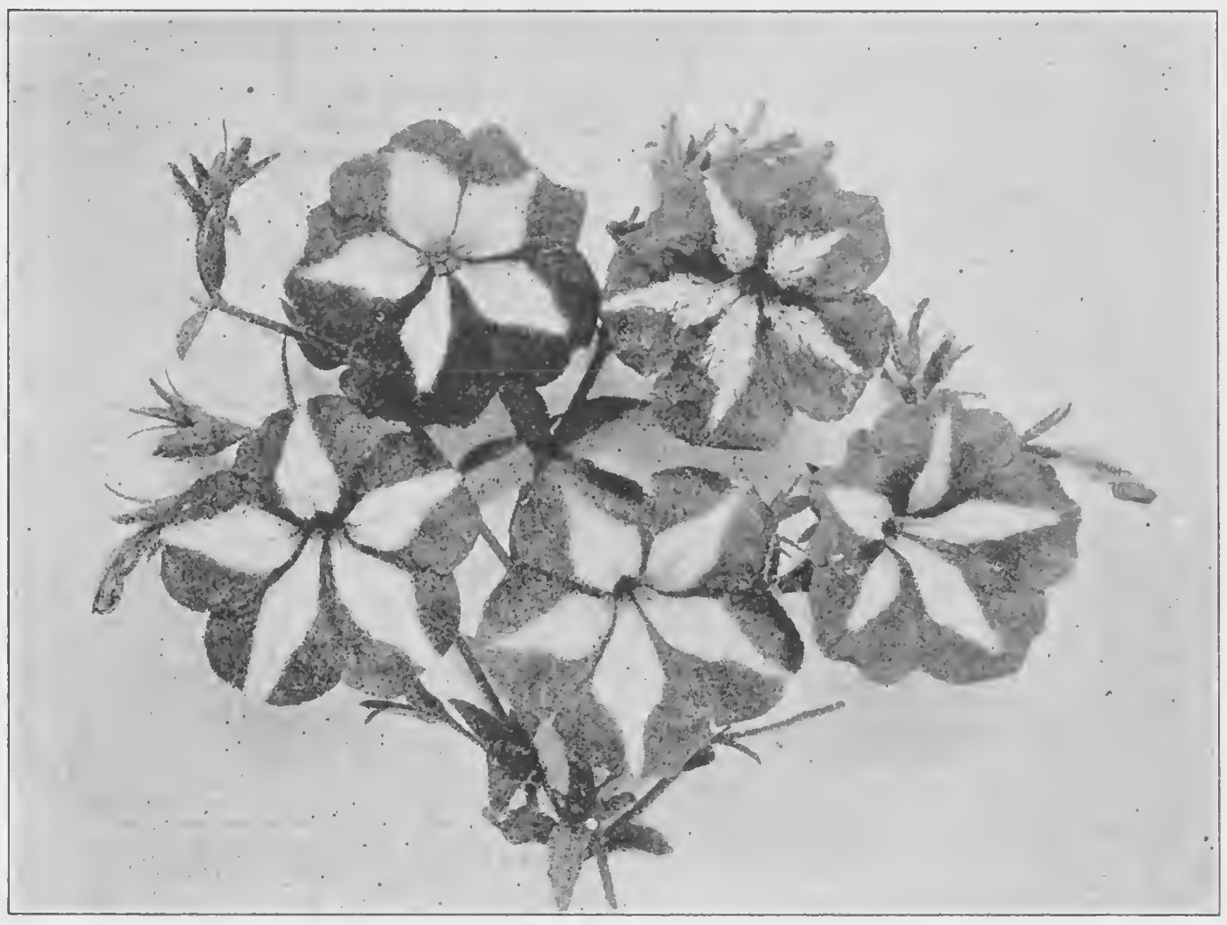
R. N.-Y.—That fertilizer did not cost much at any rate. Wait until you see what grows after it!

NOTES FROM KANSAS.

The creameries are having more cream than usual, on account of the good pasture, and the early-sown wheat will furnish rich yellow cream nearly all Winter. My 10 acres of Mammoth Soy beans and the enormous crop of evergreen hay secured from them has set many wild after them. I plowed up my flax stubble and sowed it to Siberian millet on August 7, and October 7 it was dead ripe, and a good yield, being one of the greatest curiosities ever seen along the road by my place. I raised a bouncing crop of flax on the ground that was taken off on July 6 and 7, but it did not rain enough to plow and put in millet until August 4, when 1.76 inches of rain fell, and I put two big teams at work and had the millet all in August 7. I also sowed Mammoth clover with it, and the clover now shows green all over the field. I could have put the millet stubble into wheat without plowing, and next year put the wheat stubble into millet again, then into wheat in early October, thus getting two crops each year,

Our Government Year Book mentions Siberian millet but does not tell much about it. The seeds are very much larger than common millet seed, and make excellent poultry feed, being nearly one-half the size of pop corn kernels. It only takes 15 pounds of seed per acre, as each plant stools out the same as wheat, and the chinch bugs have never yet been known to trouble it. It is my opinion that this plant and acclimated Mammoth Soy beans will make a valuable addition to the farm crops in this climate. I have recently sold five acres off the farm for a mammoth brick plant, and three railroads on my south line take 15 acres more, so I am forced to raise two crops each year in order to carry the usual amount of live stock. It has been a famous year for sheep. They never were known to thrive so well. I sold down my flock to only 14 ewes and one imported ram, and every one of them is a show sheep. I sold down my Shorthorn herd of cows to four cows and three calves, and my purebred herd of Poland China hogs to 10 show sows and a splendid boar. J. C. N.

Allen Co., Kan.



STAR AND FEATHERED STAR PETUNIAS. FIG. 335. SEE PAGE 742.

AGRICULTURAL USE OF PLASTER.

Why It Is No Longer Used.

IN NEW YORK STATE.—Ground rock containing a large per cent of sulphate of lime was formerly used quite extensively on land to increase productivity. Its chief office seems to be to oust or make available potash. When used alone it requires 400 pounds of water to dissolve one pound of gypsum; hence it should always be used in small quantities, from one-half bushel to two bushels per acre. Formerly, when the land was full of potash which was not readily available, the application of land plaster in many localities produced a marked increase in yield, especially when applied to corn and clover, both of which use normally large quantities of potash. After a time, lands which had been treated for several years with land plaster failed to show beneficial results from its use, and farmers remarked that the land had become "plaster sick." The fact is, that land plaster seems to benefit the land least where the soil is deficient in potash, and most when potash is abundant but not available; hence, the practice has grown up among the most intelligent farmers of supplying the land with potash instead of treating it to land plaster for the purpose of ousting what little potash remains in the soil. I think this practice is a wise one, and that plaster is only profitable on lands which contain a large amount of "lazy potash." In our experiments we have found such lands in the black soils along the Mohawk River near Rome. So far as I can learn not one-tenth as much land plaster is now used in the country easily accessible to the plaster mills as formerly, but I think the reason for such discontinuance of its use is self-evident. So with the New England States, but I am not so conversant with them as with New York, but I am led to believe that it is not used as much as formerly in any locality except in a few rare cases. We are still using small amounts of it in the cow and horse stables, with the hope of securing double benefit; first, conservation of the liquid manures and sanitation, and second, some possible benefit to the land when the manures are applied. I. P. ROBERTS.

Cornell Exp. Station.

IN NEW JERSEY.—The use of plaster as a fertilizer is very limited as compared with its use 25 to 30 years ago. The cause is probably due to the reduced cost of direct fertilizing materials, as well as a better understanding of what constitutes a direct manure. In many cases, too, the effect of plaster is now not marked, because the benefit formerly derived is not observed, owing to the fact that the constituents readily set free by the plaster have been used up, and the plaster has no further effect. Plaster is indirect in its action, the increase in yield obtained from its use being due to the greater amount of potash that may be obtained by the plant, rather than to any direct effect of the lime in the plaster. I may say, however, that a very considerable use is now being made of plaster as an absorbent in stables and manure cellars.

New Jersey Exp. Station. E. B. VOORHEES.

IN MASSACHUSETTS.—Plaster is much less generally used than formerly. At the time, about 40 years ago, when it was so largely used, the general problems connected with the nutrition of plants were much less generally understood than at present; it was not then clearly perceived that the productiveness of soils depends in most cases upon the store of available nitrogen, phosphoric acid and potash within the reach of the plant. With the recognition of this fact the use of materials furnishing these elements naturally increased rapidly, and the use of plaster and of lime decreased, as it was believed that our soils, as a rule, are capable of furnishing the elements contained in these in sufficient quantities. More recently it has been found that while there may be lime enough in the soil to serve as a source of direct supply to the plant, lime nevertheless serves numerous important uses, such as bringing the soil into better tilth, rendering dormant plant-food constituents available and neutralizing injurious acids, or in other words, sweetening soils; and accordingly the use of lime in some form is increasing. Plaster, it is true, may serve some of the purposes served by lime, but it is less effective in all directions than lime, and accordingly the latter is generally preferred. Even this is not yet very generally employed. WM. P. BROOKS.

Mass. Agricultural College.

FARMERS' CLUB

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

The Care of Budded Stock.

J. H., Saranac, Mich.—What is the best way to care for young budded stock? Last Fall I budded several hundred, and they all seemed to take well; I don't think that one in a hundred missed. They seemed to be mostly in good order this Spring when I cut them off, but before long the buds began to drop off, and I think I lost 90 per cent. I am not a nurseryman, but a farmer, budding a few for my own use. It is peach stock I have reference to. I understand some bank them up, while others dig them up and store them in cellars or places of protection.

ANS.—Your buds were probably killed by frost. Generally speaking, an August-set bud will endure as much cold as the twig it was taken from, but the union is not always as perfect as it looks, and dries up just before starting. We would suppose thorough banking the best method of protection. Unless carefully done cellar storage lowers the vitality to a dangerous degree in many stocks.

When to Cut Peach Buds.

C. S. P., Menlo, Ga.—Will you give the proper time to cut peach buds for June budding, and also the best way to keep them dormant until time for use?

ANS.—Scions or "bud-sticks" of the peach for Spring budding should be cut as soon as the leaves are well off the trees, and after securely labeling each bundle they should be placed where they will be cool and moist. In a cold storage room would be the best place, provided they are packed in damp moss, so there will be no possibility of their drying. If this is not available then bury them in the ground on the north side of a building, where there will be the least chance of their starting until the stocks will peel. In Georgia the weather is so warm that it would almost be necessary to find some cold storage room. The butcher shops are likely to be able to furnish a small space.

H. E. V. D.

Varieties of Plums.

N. B,. Watertown, N. Y.—I intend to set a few plum trees and would like advice concerning the kinds to set. My land is sandy loam. The north winds have full sweep, and the mercury sometimes goes down to 30 degrees below zero in Winter.

ANS.—It would be safer to set the hardy kinds of American plums than the European varieties, or even the Japan where the Winters are so severe as in most parts of northern New York. Lombard will sometimes safely endure a temperature of 30 degrees below zero, and of the European type this is one of the most dependable varieties to try. Abundance and Burbank, which are Japan kinds, will also endure that degree of cold when it is not of long duration. Wyant, Ocheeda and Stoddard are perfectly hardy in Iowa and farther north and will doubtless be the same in northern New York. They are of the native Americana type. Sandy loam is a good soil for plums. H. E. V. D.

Small Fruits for Arizona.

B. P., Thatcher, Ariz.—What kind of raspberry, strawberry or blackberry will do well in this climate? We are in a desert country and have to irrigate to raise anything. I have lived here the past six years, and I have not seen the day in that length of time that the sun did not shine. The thermometer ranges all the way from just above zero in Winter to 110 degrees in the Summer, with a cool breeze every warm day, so that the heat is not over oppressive. Apples and pears do well. Peaches are occasionally caught by frost in the late Spring, but are never a total failure. What kind of soil would be best to plant berries in, clay, clay loam, sand, or sandy loam? We have a variety of soils in this valley. The variety of fruit necessary for this climate is one that will take the least water to mature and make full-grown berries.

ANS.—It may be said that Arizona is a very unsuitable place to grow berries of any kind, except where the climate is somewhat cool, and where irrigation is easily and abundantly supplied. Under such conditions I think almost any of the varieties of this fruit might do fairly well. You will find the Bubach, Crescent and Warfield strawberries to be very good, and as likely to stand that climate as any other varieties. The Cuthbert and Loudon raspberries are as good as any of the red varieties, and the Kansas is a very good black kind. Of the blackberries, Snyder and Taylor will perhaps be among the best to try. Almost any kind of soil that is good for apples and other fruits will suit the berries. Both sandy or clay loam are good.

H. E. V. D.

The Lorentz Peach.

W. E. G., Hammonton, N. J.—I have a peach called the Lorentz which has some fruit nearly ripe, but only from one to four each on a few trees two years old. The fruit is of good size, although the trees were not pruned for fruiting. Lemon color with blush and yellow; juicy and fine flavor. A rapid strong grower; last year the trees made seven feet of growth which was cut back this Spring to 18 inches and made about six feet or more this season. The variety is said to have originated in West Virginia and to stand a very low Winter temperature and late Spring frosts. I should like to know more about it, as it ought to be a money maker.

ANS.—The Lorentz peach is considered by those who have tried it to be a very good variety. I think from what you say that you understand its character quite well, and you ought to know about how it will do with you, and whether it is worthy of further planting. Those who originated it have written me years ago that it would endure considerable low temperature without serious injury, but I have never tried it myself. It is a good late yellow peach and is worthy of general trial.

H. E. V. D.

How to Handle a Poor Field.

W. H., Springfield, Mass.—We have a field of poor sandy loam, too poor for any crop except buckwheat, which yields fairly well. What is the best way to bring this land up? We can get black swamp muck handy; stable manure we require for other fields.

ANS.—We believe that a crop of cow peas plowed in next Fall, and followed by rye, will put the field in fair condition for cropping. Read the articles on cow peas which are to appear during the Fall and Winter. The swamp muck may help if it is well rotted in a compost before using. It will be a mistake to use the sour muck right from the swamp.

Fertilizing Value of Corncobs.

L. C. B., Crown Point, Ind.—I have been wondering whether it would pay to manure with corncobs, and would like your opinion as to their value, at the elevator, whole or crushed, as I suppose they would rot quicker if crushed.

ANS.—The following table shows the composition of corncobs as compared with some other substances. The figures give the number of pounds in one ton.

	Nitrogen.	Potash.	Phosphoric acid.
Corncobs	5	5	1
Wheat straw	10	13	5
Oat straw	11	32	5
Oak leaves	20	7	4
Pine needles	16	3	2

Thus it appears that corncobs rank low in fertilizing value. Most people have an idea that the cobs contain large amounts of potash. This is because the ash of the cobs is rich in that substance. In one ton of cobs there are only nine pounds of ash, of which five pounds are potash. As compared with other fertilizing substances a ton of the cobs would be worth less than $1, and as they decay slowly they would add but little available fertility to the farm. The crushed cobs will make fairly good absorbents for the liquid manure. We should mix them with the manure in the barnyard, especially where the yard is wet or muddy. We doubt whether it would pay to haul the crushed cobs to spread directly on the soil. We find it most satisfactory to use the whole cobs for fuel and either scatter the ashes on the land, or use them for the hogs.

Tools on a Maine Farm.

L. B. S., Brunswick, Me.—We are on an abandoned farm, having over 80 acres of clayey loam fields, much of which has hardly been stirred for 20 years. Though land is not yet fitted we expect to make a trial of vetch, Crimson clover, peas, rye and rape. We moved here about August 10, on which date we planted three kinds of peas, same of beans and one kind of corn. The only fertilizer used was leached soot, dirt and ashes from an old open top chimney. I wish to get 60 of the 80 acres into a three or four-year rotation as soon as possible. I have very little barn manure and would appreciate any suggestions. The money crop will probably be potatoes. Would you advise the addition of a grain drill and binder or other tools to this list: Clark sulky disk plow, double action Cutaway harrow, Planet Jr. pivot-wheel cultivator, corn planter, garden seed drill, weeder and hay tools? I have been unable to find a grain drill in use about here, or at implement stores. I would like to know to what extent I can make use of a combined grass seeder, grain and fertilizer drill in distributing lime and ashes, sowing clover, cow and field peas, vetch, rape and turnip seed.

ANS.—A rotation will, of course, depend on the crops you wish to grow. For a five-year rotation the one followed by D. C. Lewis, of New Jersey, and often described in THE R. N.-Y., is a good one. You may not want to grow wheat or corn. If you intend to grow wheat and can afford to keep the money in tools, we should certainly buy a grain drill and a binder. The drill is largely used by farmers for distributing fertilizers. The only objection to its use for ashes and lime is the fact that the fertilizer box is too small, and where a ton or more is to be used to the acre constant refilling is required.

Steel Range at ½ agents' prices. Guaranteed for 5 years. Send for free catalogue (4 styles) also catalogue of **Sewing Machines** and **Buggies and Harness** in colors. 1000 things you want. EVERYBODY'S GARDEN.

A PROSPEROUS YEAR.—Not for many years, in this section at least, have the returns from gardening been as satisfactory as in the past season. Crops in all lines have been nearly or quite up to the average, while the demand has been far in excess of former years, with correspondingly high prices. These features doubtless have by no means been general the country over, for weather conditions in many regions have been anything but favorable, and shortage in some localities has been largely responsible for brisk demand and high prices in other sections. The respite from the usually sharp competition has been highly appreciated by the gardening craft, and flushed with the season's success, they go forward on more extensive operations for next year. But with the increased efforts for more extensive operations, will come the almost ever present contingency of competition, not always turned aside from its natural trend by weather conditions such as have prevailed the present season. As these favorable conditions must be considered only periodical, and not to be continuously looked for, the lessons generally to be learned from the prevailing contingencies of close competition and high price of labor are in economy of production. This can only come through more intelligent efforts in intensive culture, larger yields and higher qualities. Making one acre produce what two acres have heretofore grown must be the constant aim of every producer; and this implies the closest attention to every detail of the work. Watch the small leaks, make the by-products which in gardening are usually the refuse, go just as far as possible in meeting expenses. The pigs and the chickens are the most economical means of converting this into cash and fertilizer.

THE COMPOST HEAP.—This is also a safe deposit for much that otherwise would be lost, and is, I think, a necessary adjunct of every well regulated garden. At the same time some judgment is necessary to determine what ought and what ought not to be consigned to the compost heap. Evidently, the fire is the safest and most economical place for all noxious weeds containing any percentage of seed, all vines or brush likely to harbor and become the breeding place of insect pests. To handle over and doctor them sufficiently effectively to destroy the germinating power of the seed and the insect life, requires more time than the fertilizing value of the rubbish will ever compensate for. However, sufficient other rubbish will usually accumulate around the average farm or garden to make the compost heap very useful and desirable.

WINTER GREENS.—If the spinach bed for Winter greens has not materialized, a substitute equally as good may be provided and grown very easily. Select some of the overgrown beets too large and woody for table use, and set them in sand or soil on the cellar bottom, or other convenient place, where they can receive sufficient heat to grow the tops rapidly. The hotbeds banked up with manure sufficiently to turn the frost will grow a good crop. In this case, manure underneath the beets, and the sash on top will be necessary. Lacking these the rhubarb or house cellar will do, as they will grow equally well in the dark. Turnips may also be grown in the same manner; but growing in the hotbed with exposure to the light will be most generally satisfactory, as when grown in the light they will retain the naturally green color, instead of the lemon color which is the result of growing in the dark.

CHARCOAL FOR POTTING.—Good soil is, of course, necessary for successful results in potting bulbs, but even good soil coming directly in contact with the bulbs is very liable to cause bulb rot. To avoid this, the precaution to line the hole or receptacle for the bulb with sand is usually necessary. Many successful growers, however, prefer charcoal dust to sand, and claim it to be an almost certain preventive of the trouble. The method is certainly worthy a trial, and to be successful the bulb should be entirely covered with the charcoal, allowing no soil to come in direct contact with the surface of the bulb. For those unaccustomed to its use, it is safe to try a part in this way and the remainder in the way with which they are acquainted; and this will prove to a certainty which is the better way. In experimental matters it is always safe to "make haste slowly." The charcoal broken in small pieces (not powdered), and placed in the bottom of the pots is without doubt the best of drainage.

FOOD FOR THE WINDOW PLANTS.—Many ready-for-use plant foods are put up by different companies, and while most if not all of them are genuinely good, they are often hard to procure as they are sold only by dealers in certain lines. The following formula can be obtained by any druggist, and is one of the very best plant foods in use: Sodium nitrate, three-fourths pound; sodium phosphate (dry), one-fourth pound; sodium sulphate, one-half pound. Pulverize and thoroughly mix the ingredients dry. It may be kept for any length of time by covering closely. When required for use, dissolve in the proportions of one rounding tablespoonful to a gallon of hot water, using a half teacupful to a six-inch pot. Apply once in two weeks by pouring the solution on to the soil (not on the plant), varying the amount used according to the size and vigor of the plant and also the size of the pot.

EARLY SWEET PEAS.—For the first sowing of sweet peas, the ground should be prepared this Fall, any time before the ground freezes too hard to work thoroughly. Select a warm sunny spot, sheltered from the north and west winds, arranging if possible to run the rows east and west. Spade the ground deeply, working in a liberal supply of well rotted manure, and top-dress with air-slaked lime and wood ashes, one quart of the former to four quarts of the latter for 12 or 15 feet of double row. This should be thoroughly worked into the soil, and the bed should then be covered with coarse manure or any kind of mulch to prevent freezing too deeply. Remove the mulch early in the Spring and as soon as the surface is sufficiently dry to work nicely, rake the soil until well fined and sow the seed. Sow in shallow drills five or six inches apart and cover not to exceed an inch depth. Sow as soon as the ground will admit of working, even if the frost is not out below, as there will be little if any danger of injury from freezing. In this way the blooms may be had long before they can be obtained from the seed sown for later blooming. Sowing for late and continuous blooming requires far different treatment and will be treated at length later on. J. E. MORSE.

Michigan.

Selling a "Balanced Ration."

Reader, Ohio.—I have a quantity of corn to dispose of. Do you think it probable that I can grind it, mix it with oil meal, bran, shorts (bran for cattle, shorts for hogs), or other feed rich in protein, making a "balanced ration" with a nutritive ration of say 1:6, and sell it at a reasonable profit to eastern stockmen at $22 to $24 per ton?

ANS.—We doubt it. The chances are that the expenses would more than eat up your profits. You would find it difficult to interest buyers in your feed. Several eastern States have laws governing the sale of mixed feeds, and the cost of license and analyses must be considered. You would, no doubt, make a good mixture, but we question your ability to compete with the large firms that use the refuse of oat or hominy mills as the base of their mixtures. If you cut the price too low a large class of buyers would become suspicious at once. We think it would pay you better to sell the whole corn at the present high price, or feed it to hogs.

How to Store Celery.

O. S., Fitchburg, Mass.—I have a quantity of celery and would like to know how to store it away after taking it from the field. Can it be put in a hotbed, and if so, how should it be managed? Can early kinds be planted so close as to bleach themselves? How early can it be put on the market? What is the latest method for keeping cabbage through cold weather? Is there a book on celery?

ANS.—A hotbed is not a good place to store celery. It would be quite certain to rot or start into growth with any covering that could be placed over it. Where celery sheds are not available the plants may be closely packed in a trench dug just as deep as the celery is tall, in any well-drained place. The trench should not be more than a foot wide. The celery plants are packed closely, in an upright position, the roots resting on the earth floor. It may be trenched from November 1 to 15, taking care to avoid hard freezing. A covering of leaves or straw should be put on gradually, until by the last of December it is a foot or more thick. If put on too heavily at first the celery is quite sure to rot or heat. Boards may be placed over the covering to keep out most of the rain, though a little moisture is beneficial. Celery may also be stored in a cool cellar, covering the roots with moist soil, which may be carefully watered when it shows signs of drying out. Boards should be placed on edge at intervals of a foot or so to divide the celery, and insure ventilation. Early celery may be planted about a foot apart each way in very rich soil, and watered well during dry weather. It will grow tall and tender, and sometimes bleaches well. This method is not growing in popular favor. Cabbages are wintered in root houses built partly underground, or stacked upside down in the field on a dry place, and covered with a foot or more of earth, which is protected from hard freezing by a thick coating of straw or long stable manure. A good book on the required topic is Celery for Profit, by Greiner; 20 cents from this office.

During the sixty-two years that Dr. D. Jayne's Expectorant has been used in the treatment of Pulmonary disorders, the percentage of cures has largely increased. Undeniably, IT HEALS THE LUNGS.—*Adv.*

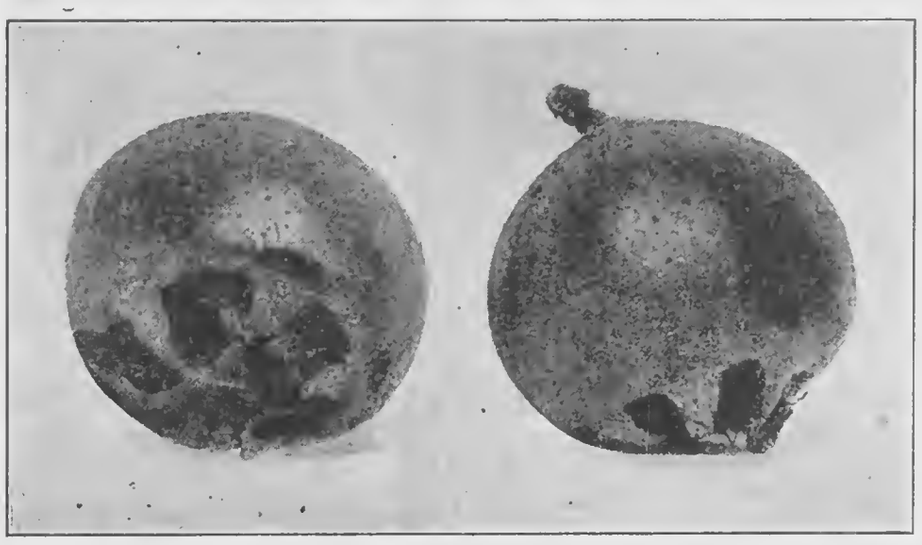
NOTES FROM THE RURAL GROUNDS.

GOLDEN ROD AND WILD ASTERS.—One of the many compensations for the past rainy growing season is found in the brilliant display of golden rod and hardy Asters just closing. These beautiful wild flowers, lining the roadsides and covering waste uplands, have never bloomed to greater advantage. We expect a good show of yellow, white and purple from these Autumn bloomers in moist places every year, but the rainy Summer put such vigor in the species growing on hillsides where they are usually dwarfed by drought that the attention of the most casual visitor is arrested by the masses of blooms. The multitude of species contained in Aster and Solidago, the genera including the starworts and golden rods respectively, is so great and the specific distinctions often so obscure that only a careful botanist can distinguish them apart. Some few of the most showy kinds have got into cultivation, and in every case seem improved by the change. Aster Novæ-Angliæ is most commonly planted, and has broken from the purple of its wild state to a very pretty rose color, as well as white. Any of the wild Asters or golden rods may soon come into general cultivation as popular taste for reliable hardy flowering plants increases. About the only golden rod now planted is Solidago Shortii, which grows nearly four feet high in good ground, and bears great panicles of bright yellow flowers in September. The Asters and golden rods may be found on all soils, from heavy muck and clay to barren sandy and gravelly slopes, and the different kinds vary as much in stature and season of bloom. Some thrive in shade and others like full sunlight. A pleasant task awaits the cultivator who cares to study the needs of these plants.

SOME MEDLAR FRUITS.—Few exhibits attracted more attention at the Fall show of the horticultural section of the American Institute, held September 24-26, than a collection of medlars in named varieties, contributed by Cornell University Experiment Station. The European medlar, Mespilus Germanica, is commonly cultivated abroad, but is almost unknown here. It may be likened to an overgrown thorn-apple, and is botanically nearer to the thorns than to other pome fruits. Only one species, native to central Europe, is known, but it has broken into many garden varieties, differing in size, form and adaptability. Fig. 336, this page, shows two favorite kinds, Hollandaise on the left and Royal on the right, in natural size These fruits are now just coming into the English markets, bringing from 38 to 50 cents per half bushel. The medlar is used abroad as a dessert fruit, and is of limited value, taking about the place of persimmons in our southern localities. It is a late ripening fruit, and the flavor does not develop fully until they have been touched by frost and softened by keeping in a cool airy place. The flavor is peculiar, and rather acid, but is enjoyed by many when fully softened and just on the verge of decay. The medlar is very hardy as to tree, and may be planted up to the Canada border without fear of cold, but it requires a fair season of growth to mature the fruits, which are excessively hard and acrid up to the point of softening after being gathered. Medlar trees grow 12 to 15 feet high, and are very twiggy and tough-wooded. The foliage is luxuriant and handsome, having a soft woolly effect, while the large white flowers appear late in May. The trees are grown from seeds which are hard and slow to germinate. Choice varieties are grafted on various thorns, and also on pear and quince stocks as well as budded or grafted on their own seedlings. The fruits are used for preserving as well as eating in their natural state. The culture requires no special care, as they thrive wherever pears or apples do well. The Japanese loquat is often erroneously called a medlar, but it has no affinity to the true species. It is a tropical fruit, and can only be cultivated under glass in the North. The botanical name is Eriobotrya Japonica. Some of the Japan thorn-apples of the genus Photinia have been termed medlars with more propriety than the loquat, as they are more nearly allied to the real Mespilus, but none produces fruit of culinary value. They resemble the Mountain ash to some extent and are not hardy north of Washington. Some are evergreen in character. P. villosa is a deciduous species, which has been grown successfully in Massachusetts.



HOLLANDAISE AND ROYAL VARIETIES OF MEDLAR. FIG. 336.

INTEREST IN CATALPA SPECIOSA appears to be very general, judging from the number of requests for the address of the International Society of Arboriculture received since the publication of the note on this valuable native tree, on page 646. Bulletin No. 1, devoted to Catalpa speciosa, may be had by addressing the secretary of the Society, John P. Brown, Connersville, Ind.

W. V. F.

SOME IMPROVED PETUNIAS.

Among the many new varieties or novelties among the common flowers of our garden, nothing that I have seen possesses so marked features or is more beautiful, than the Star Petunias grown by A. B. Howard, of Belchertown, Mass. Mr. Howard has devoted many years and a great deal of skill to improving the Petunia by hybridization and selection, and has produced a variety of the greatest beauty and fixed characteristics coming true to the two types of "Star" and "Feathered Star" blossoms. The Petunia is the plant for the million, being easily grown from seed, so hardy that it will stand frosts both in the Spring and Fall, and producing flowers continuously from May to October, and when such strains as the above are used the effect even in conspicuous places is very beautiful. The criticism of the Petunia so often made that it is a coarse and gaudy flower, only suitable for distant effect, and that it has a cheap appearance, does not apply to this strain, for the colors are so distinct and beautiful that there are few flowers that will produce such a blending with other ornamental plants, or that are more beautiful individually. Mr. Howard's dwarf Zinnias, upon which he has been at work for many years in the same way, have reached a degree of perfection found in no other strain, and when introduced to the public will add another valuable factor to our ornamental planting that we do not now possess. I am sure all lovers of the truly beautiful will welcome and use both of these new strains largely in the future in their ornamental work. The flower is shown at Fig. 335, page 739.

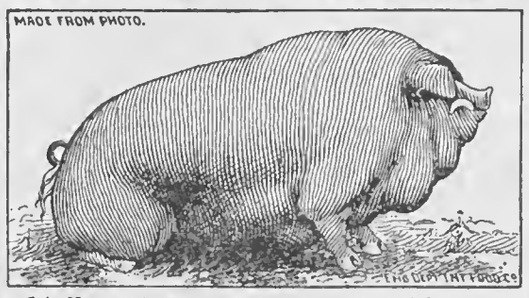
LARGEST HOG IN THE WORLD

WEIGHT 1621 LBS.



The Poland-China hog called "Old Tom" was raised in Minnesota and was exhibited at Minnesota State Fair in 1897. He made a Big Gain by eating "INTERNATIONAL STOCK FOOD." "INTERNATIONAL STOCK FOOD" causes Hogs, Cattle, Horses and Sheep to grow very rapidly and makes them Big, Fat and Healthy. Is used and strongly endorsed by over 500,000 Farmers. It is sold on a Spot Cash Guarantee to Refund Your Money in any case of failure by over 30,000 Dealers. It will make you extra money in Growing, Fattening or Milking. Owing to its blood purifying and stimulating tonic effects it Cures or Prevents Disease. It is a safe vegetable medicinal preparation to be fed in small sized feeds in connection with the regular grain. It Fattens Stock in 30 to 60 Days less time, because it aids Digestion and Assimilation. In this way it saves a large amount of Grain. The use of "INTERNATIONAL STOCK FOOD" only costs 3 FEEDS for ONE CENT. Ask your dealer for it and refuse any of the many substitutes or imitations. It always pays to feed the best. "INTERNATIONAL STOCK FOOD" is endorsed by over 100 leading Farm Papers.

A $3000.00 STOCK BOOK FREE

MAILED TO EVERY READER OF THIS PAPER.

This Book Contains 183 Large Colored Engravings of Horses, Cattle, Sheep, Hogs, Poultry, etc., and of this Hog. It cost us $3000 to have our Artists and Engravers make them. It contains a finely illustrated Veterinary Department that will save you Hundreds of Dollars. Gives description and history of the Breeds of Horses, Cattle, Sheep, Hogs and Poultry.

THIS BOOK FREE, Postage Prepaid, If You Write Us a Postal Card and Answer 3 Questions:

1st—Name this Paper. 2nd—How much stock have you? 3rd—Did you ever use "INTERNATIONAL STOCK FOOD" for Horses, Cattle, Sheep, Hogs, Colts, Calves, Lambs or Pigs.

The Editor of this Paper will tell you that you ought to have a copy of our finely illustrated Book for reference. The information is practical and the book is Absolutely Free. We will give you $14.00 worth of "INTERNATIONAL STOCK FOOD" if Book is not exactly as represented. We Won the Highest Medal at Paris in 1900.

Answer the 3 Questions and Write Us At Once for Book.

Largest Stock Food Factory in the World. Capital Paid in $300,000.00.

INTERNATIONAL FOOD CO., MINNEAPOLIS, MINN., U. S. A.

3 FEEDS FOR ONE CENT

HOPE FARM NOTES

Do we understand you to say that shredded corn fodder is equal to Timothy hay for horses?

That has been our experience for Winter feeding. The fodder must be bright and sweet. For Summer feeding it would not be so good.

How do you prove your statements?

For two Winters we have not fed any hay, and the horses kept in good weight and spirits.

Has anyone given it a really scientific trial?

Yes, the New Hampshire Experiment Station (Durham) in Bulletin No. 82, gives a record of one of the most practical feeding experiments I have ever noticed. There were five big horses working on the farm. Their average weight was 1,220 pounds. For two years an accurate account was kept of all that these horses ate and drank and five different rations were fed them.

What was the object of the experiment?

They wanted to know what it cost to feed a horse for one year; also whether wheat bran would take the place of oats for a working horse, and whether corn fodder worth $5 per ton will substitute for hay worth $16.

What did they find out?

Here are their figures for two years' feeding of five horses:

10,044 lbs. oats at 36 cts. per bu..	$113.00
25,570 lbs. corn at $16 per ton.....	204.56
1,530 lbs. gluten at $18 per ton.....	13.77
1,440 lbs. linseed oil meal at $28 per ton	20.16
225 lbs. cotton-seed meal at $26 per ton	2.93
10,711 lbs. bran at $17 per ton.....	91.04
36,540 lbs. Timothy hay at $16 per ton	292.32
2,190 lbs. corn stover at $5 per ton.	5.48
Total for two years.....	$743.26
Average cost for each horse per year	74.32

Do you mean to say that it costs nearly $75 to feed a horse one year?

It would cost me more than that if I fed hay all the year around, and fed oats. That is, I could sell the hay and grain required to keep Dan and Frank one year for more than $150! I cut this amount down by feeding more bran and ear corn and shredded fodder.

Where are your figures?

Take the statement as given above. Suppose that for at least five months in each year they had fed fodder instead of hay. This would mean 60 pounds of fodder per day for 302 days, or 18,120 pounds instead of the same weight of hay. At their own figures this would substitute $46.05 worth of fodder for $147.36 worth of hay—a saving of $101.31.

That surely brings it down!

Yes, and if they had fed 8,000 pounds more bran instead of oats they would have saved $21.60 more, and brought the cost of feeding one horse for a year down to $62.03, allowing full prices for all food. That is a saving of over 16 per cent.

How did they test the corn fodder?

They fed two horses 12 pounds of hay per day for 75 days, and two others 12 pounds of the fodder. One horse of each lot had oats and corn, and the others bran and corn. One horse fed on fodder held his weight and the other gained. They did just as well as the horses that had hay.

Was this fodder shredded?

No, it was run through an ordinary cutter, and was not so good for feeding as the shredded stalks.

Well, what about it?

I think these figures prove what I have been saying about shredded fodder. Where hay is cheap it will not mean so much, but in sections like ours where good loose hay is salable at $20 per ton or more this means a good deal. Take a poor man in the city with a big hungry family and a small and shrinking job. Potatoes cost him $4 a barrel, but he suddenly finds that his people are just as well satisfied with yellow turnips at $1.25. That's the way a farmer ought to feel when he finds that the horses will make no audible complaint (at least none that he can understand) when he substitutes $5 stalks for $16 hay! Don't you forget, however, that all this means taking better care of our stalks and getting them under cover early.

They also fed linseed and cotton-seed meals! Why?

Chiefly because they wanted to compare them with oats. The cotton-seed meal was not very satisfactory. The linseed was very useful. I always feed a little of it when the horses are eating stalks.

What are stalks worth in your country?

They have no regular value. Last Winter a neighbor, an old man, sold a horse which was thrown back on his hands. He had no feed and I let him have long stalks which, at what he said was "the going price," were worth $6. They kept the horse alive for nearly four months! She had a very small amount of ear corn in addition. She kept alive on this cheap ration, but that was all. It never pays to let a horse run down in the Winter. He won't get his full strength back until too late for the Spring plowing.

FARM NOTES.—On October 25 the Cannas were still blooming and the sweet corn at the top of the hill untouched by frost. The killing frost came last year on October 18. . . . We are still sowing rye, and shall continue to do so up to November 10 at any rate. This late-sown rye makes but a poor start in the Fall, but it jumps lively in the Spring and gives a good crop of fodder or green manure. The Orchard grass in the old orchard is now a beautiful sight. How the stuff does grow! I shall turn the stock in for a few hours each day to nibble down this thick Fall growth. I would not do it, with any other grass! . . . The Cow-horn turnips have made a good stand. On October 19 a fair specimen plant measured two feet nine inches from tip of root to top of leaf. The root itself was 13 inches long—11 inches being below ground. Right along side, a patch of rape seeded on the same day showed plenty of plants three feet from tip to tip, with roots two inches longer than the Cow-horn! The roots of the rape are much smaller, however.

Is not the rape a better manurial plant then?

No, I do not think so. It requires a much richer soil than the Cow-horn. The latter seems able to grow and thrive under conditions which would give the rape the hollow horn. In rich open soil the rape goes down deep, but it will balk and turn at a hard subsoil, while the Cow-horn will dig right through it. It has always seemed to me a mistake to use for manurial purposes a crop that needs to be fed, or which sulks if the soil is not rich. That is why I like the cow pea. Where soil will produce a fair crop of corn I would not grow a crop to be plowed under; at least I would not give the whole season to it. For green manuring I want a crop that will improve poor land—not one that requires good land to make it grow. I like the combination of Cow-horn turnips and Crimson clover very much for Fall growing.

MANURE MATTERS.—You have been writing lately about "chemicals and clover" for fields at a distance from the barn.

Yes, I fully believe in that system. It is quite possible.

But good farmers say that all hay and straw should be used on the farm, and not sent away.

I know they do, and equally good farmers say and know that they can often sell their hay and grain for enough to buy twice the fertility they sent away. It is sometimes, not always, good policy to do this.

Name a case.

I have a quantity of rye straw which I expect to sell at $20 per ton. According to the chemists I sell 11 pounds of nitrogen, 22 pounds of potash and six pounds of phosphoric acid. I can buy this amount of fertility in the form of high-grade fertilizer for less than $4. I can go into the woods and rake up leaves for bedding which are worth more for fertilizing than the rye straw. Under these circumstances would it not be foolish for me to use the straw for bedding my horses?

But this would not be fair of a crop like hay that could be fed.

Why not? Take Timothy hay. A ton contains 27 pounds of nitrogen, 40 of potash and 14 of phosphoric acid. True, I send away more than when I sell the straw, but I can buy the fertility for less than $8 and feed my stock on corn fodder, which is not salable in our market. Thus it may be better policy for Hope Farm to feed a horse in the city than it would to feed a cow at home! I would not for a moment belittle the plan of feeding all that we profitably can at home. There is no cast-iron rule about it, however, and sometimes it will pay to sell rather than to feed. It requires wise judgment to tell when this is true.

Then you believe in stable manure?

Yes, indeed. While other forms of plant food may be just as available there is no form of humus or vegetable matter quite equal to manure.

Would not a crop of clover plowed directly into the ground be equal to the manure made by feeding the same clover to stock?

The manure would have one advantage.

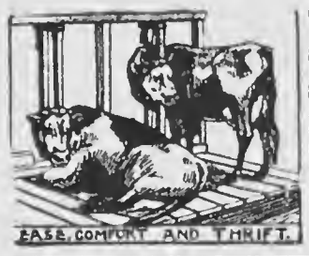
What is it?

The chief advantage that I will admit is that the manure contains more of the bacteria that do so much work in the soil toward breaking up and setting plant food free. Personally, I do not consider this advantage great enough to warrant hauling manure for any very long distance. It is my own practice, therefore, to crowd all my manure on the 20 acres nearest to the barn and use chemicals and manurial crops on the rest of the farm. If the farm were level I should scatter the manure over a larger area, but as it is I could not do so without hauling up a very steep hill.

HOME COMFORT.—The nights are long and the air chills after the sun goes down. We realized that the other night as we started on a long ride home from town. We had a late start, as there had been various delays, but when Charlie finally shook out the lines Dan and Major started off to cover the 12 miles of hilly road that lay before Hope Farm. Aunt Emma and Grandmother pulled their cloaks around them. The Madame was to come later on the train.

"That's the green corn!" said Charlie as old Major began to sweat even in the chilly air. The sun went down and the shadows grew darker, and still the horses trotted on mile after mile. We stopped talking, as many do when twilight comes on with its load of old-time thoughts. At last we left the main road and climbed the hill that looks down on our valley. There it was—far across on the other side—the light of Hope Farm. There is little sentiment about Dan or Major, but they know the remedy for an empty stomach when they see it in the distance, and they picked up their feet for a final sprint. With a whirl we turned the corner into our own road. There was Shep, watching for us in front of the house. The Cutting was bustling about inside getting supper ready, and four little faces were glued against the window. The Graft brought a chair to help Grandmother step out of the surrey. The Bud's little face fell because Mother did not come, but that did not last. Philip and Hugh had the chores done, and they led the tired horses off to the barn. All the barn folks were made snug and then we went in to sample what the Cutting had ready for us. With bread and butter, codfish and cream, a slice of meat, baked apples and a big bread pudding piping hot from the oven, we soon filled out the kinks that had been jolted into us on the long ride. Surely the farm home is a good place to get into on a cold night. We see the best side of it after driving in the dark past other homes. H. W. C.

For the land's sake, use Bowker's Fertilizers. They enrich the earth.—*Adv.*

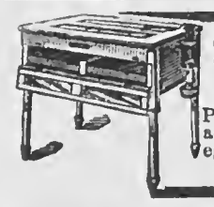


The BEST Cattle Fastening. SMITH'S Self-Adjusting Swing Stanchion The only *Practical* swing stanchion invented. Thousands in use. Illust'd Circular free. GLENORA MFG. CO., Glenora, Yates County, N. Y. Infringements will be prosecuted

THE CHAIN-HANGING
Cattle Stanchion
The most practical and humane Fastener ever invented. Gives perfect freedom of the head. Illustrated Circular and Price free on application. Manufactured by O. H. ROBERTSON, Forestville, Conn.

"GET A DANDY"
the fastest cutting bone cutter made, and double your egg yield. Sold direct on 30 days trial. $5 up. Catalogue free.
Stratton Mfg. Co., Box 13, Erie, Pa.

VICTOR INCUBATORS
The simplest, most durable, cheapest first-class hatcher. Money back if not as represented. Circular free; catalogue 6c. We pay the freight. GEO. ERTEL CO. Quincy, Ill.



200-Egg Incubator for $12.80
Perfect in construction and action. Hatches every fertile egg. Write for catalogue to-day.
GEO. H. STAHL, Quincy, Ill.

LIFE PRODUCERS
SUCCESSFUL INCUBATORS.
LIFE PRESERVERS
SUCCESSFUL BROODERS.
All about them in our 158 page catalogue. Mailed for 4 cents in stamps.

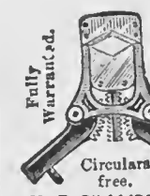
MAKE POULTRY PAY
by feeding green cut bone. The Humphrey Green Bone and Vegetable Cutter is guaranteed to cut more bone in less time with less labor than any other cutter made. Send for free book containing blanks for one year's egg record.
Humphrey & Sons, Box 39, Joliet, Ill.

A FULL EGG BASKET
results if hens are fed raw cut bone—the greatest of egg producers.
Mann's Bone Cutter 1902 Model
cuts all bones, including meat and gristle easier and faster than any other or don't keep it. Open hopper. Self-governing feed. Wastes nothing. TEN DAYS TRIAL. No money in advance. Cat'lg. free.
F. W. MANN CO., Box 15 MILFORD, MASS.

LATEST IMPROVED DEHORNER (Newton's Patent.)
Every Dehorner Guaranteed
THOUSANDS IN USE.
Ask your hardware dealer for them or write
H. H. BROWN MFG. CO., · · DECATUR, ILL.



A QUICK, SHARP CUT
hurts much less than a bruise, crush or tear.
DEHORNING Done with the KEYSTONE KNIFE
is the safest. Quick, sharp cut. Cuts from four sides at once. Cannot crush bruise or tear. Most humane method of dehorning known. Took highest award World's Fair. Orders with cash filled from Chicago if desired.
M. T. PHILLIPS, Pomeroy, Pa., (Successor to A. C. BROSIUS)

Thirty Thousand Pennies for Your Thoughts!
$300.00 IN CASH PRIZES
will be given to farmers and their wives, sons and daughters for writing acceptable **Advertisements for DIETZ LANTERNS,** as follows:

1st Prize, for best advertisement in prose	$ 60 00
2d " " next best advertisement in prose	40.00
3d " " best advertisement in poetry	25 00
4d " " third best advertisement in prose	20 00
Next 4 Prizes, prose or poetry, $10 each	40 00
" 10 " " " " 5 "	50.00
" 20 " " " " 2 "	40.00
" 25 " " " " 1 "	25.00
Total 63 Cash Prizes	$300.00

CONDITIONS:
All advertisements entered in this contest must be original with the sender. The writer or some member of the writer's family must be an actual user of a Dietz lantern. This is necessary in order to know the Dietz points of superiority over other makes The writer may illustrate or suggest the idea for an illustration for the advertisement, or may omit illustrations altogether, at his option. There is no restriction as to the number of advertisements each may enter for the prizes, but **each one** should have attached the writer's name and address plainly written. All advertisements submitted are to become our property **There is no charge of any kind for entering this contest.** This contest closes December 15, 1901. The editors of three prominent farm papers will act as judges to decide the merits of advertisements submitted Announcement of the prize winners will appear in this paper as soon as possible after the awards are made.

YOUR THOUGHT MAY BE VALUABLE.
You stand the same chance as anyone else to win a prize -If you try. "Fair play and no favor" is the motto of this competition. Samples of previous advertisements, illustrated catalogue of Dietz lanterns and any further particulars desired will be sent all who write that they intend to complete for the prizes. Mention this paper and address all communications and entries **Advertisement Contest Dept.,**
R. E. DIETZ COMPANY, 87 Laight St., New York City.
This announcement will not appear again. Put this aside for safe keeping and reference.

The Rural New-Yorker

THE BUSINESS FARMER'S PAPER.

A National Weekly Journal for Country and Suburban Homes.

Established 1850.

HERBERT W. COLLINGWOOD, Editor.
DR. WALTER VAN FLEET, H. E. VAN DEMAN, MRS. E. T. ROYLE, } Associates.
JOHN J. DILLON, Business Manager.

SUBSCRIPTION: ONE DOLLAR A YEAR.

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs.

"A SQUARE DEAL."

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

Name and address of sender, and what the remittance is for, should appear in every letter.
Remittances may be made in money order, express order, personal check or bank draft.

THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, NOVEMBER 2, 1901.

10 Weeks for 10 Cents.

WE would ask every reader of this issue to turn to page 749, and see our announcement for trial subscriptions during November and December. To introduce it to new homes we will send the paper 10 weeks for 10 cents. See the inducements for getting up clubs. If you do not feel that you can get up a large club, you at least have one neighbor who would be glad to send an order on this basis. Tell him about it.

*

MANY farmers are in the habit of husking their corn in the field. This saves considerable heavy handling, and is not bad business in fair weather. But to sit in the field for hours at a time, when the ground is wet and the air cold and raw, is dangerous to health, and the husker is likely to get a cold which will stick to him all Winter. It is a good plan to have a few loads under cover to work at during cold mornings and damp days. There is enough work on the farm that is hard and disagreeable, without adding unnecessary burdens to work that may be done more comfortably.

*

READ and study Prof. Plumb's article on stock foods. Oats and corn are high this year, and it is surprising what a difference this makes with those of us who must buy more or less grain. These grains have long been the standard for stock food. Many farmers still believe that there is no good substitute for them. They also believe that a horse must be fed on high-priced hay, when it is a fact that bright and sweet cornstalks with bran and corn will keep a working horse in thrifty condition through the Winter. In a season like this one food economies are necessary for most of us, and no wise economy is possible without careful study of the principles of feeding.

*

OUR northern readers begin to give their experience with the cow pea this week. We believe they will clearly demonstrate the value of this crop for northern soils. We have repeatedly advised against cutting the vines for hay. We desired to prove the manurial value of the crop. We are sorry therefore that so many farmers have cut and cured the vines for hay. It hurts the feelings of a thrifty farmer to see anything with green leaves on it plowed into the ground. Much of this cow-pea hay will not make satisfactory fodder. The stubble and the roots alone will not produce nearly as large a crop as the whole plant would. Then the cow pea will be slated as "no good," which will be entirely unfair!

*

WHAT about J. W. Wadsworth and the agricultural committee of the House of Representatives? The feeling is growing among American farmers that he is not the man to represent them as the head of this important committee. We have nothing against his personal character, and he is honored and respected by those who know him best. At the same time he has, for reasons best known to himself, placed himself on record as opposed to the principles embodied in the Grout anti-oleo bill. The sentiment for this bill is strong, and constantly growing among farmers. As its objects and aims are made clearer the demand for its passage becomes stronger. There can be no doubt but that farmers are now more interested in its passage than they were one year ago. This being so, it seems evident that Mr. Wadsworth would be sadly out of place where once before he prevented the passage of this bill. He will hardly be prepared to maintain that he is right and that 5,000,000 farmers are wrong! The most graceful thing he can do would be to step aside and refuse the chairmanship. We hope he will do so, for it is not the most edifying job in the world to be compelled to drive tacks into the chair of an obstinate man. The farmers have the tacks and the hammers ready, however.

*

WE have referred, from time to time, to the swindlers who rob farmers, while professing to be purchasers of farm lands. Their plans vary, but the following is a common method: An Iowa farmer was recently approached by a man who offered a handsome price for his farm. He accepted, and the stranger, after paying down $200 to bind the bargain, departed for a neighboring city, where he was to secure the services of a notary, and return next day. The same evening another stranger appeared, who also fell in love with the place, and became so enthusiastic that he offered the farmer $8 an acre more than the first man. The farmer decided to call off the deal, but when the first comer returned he insisted on holding to the bargain, unless the owner would return his $200 deposit and $1,500 additional. This was done; the stranger departed, and the second would-be buyer never returned. Of course the two men were in collusion, and the farmer was their victim. The advice to avoid any important business dealings with strangers is almost old enough to be worn out, but there is plenty of need for it yet. Such an important matter as the sale of property is surely too weighty to be undertaken without assurance as to the good faith of all parties to the contract.

*

AMERICAN APPLE CONSUMERS' LEAGUE.

ITS OBJECT.

To make apple eating fashionable. Business in other lines of production has been doubled by convincing the public that it is *the proper thing* to wear or use a certain article. There are 40,000,000 Americans living in town and city. Educate them so that they will eat two apples each every day and you do more for practical agriculture than can be done in any other way.

LEND US YOUR TONGUE!

The League Pledge.

I agree to call for apple in some form whenever I eat a meal at any public table. Should apple not be named on the bill of fare I will ask *why not*, and endeavor to secure the serving of good eating apples. I will also encourage apple eating in my own family.

.....

It Costs You Nothing but a Little Tongue Service.

The League has already induced a number of first-class hotels and restaurants to make a feature of good apples.

*

SOME remarkable stories about apples and land come from Maine. The Maine fruit is fine in quality, and buyers are after it at from $2.25 to $3.25 per barrel. Last year one farmer tried to sell his farm for $500. This year he has 250 barrels of good fruit for sale! Another man bought half interest in a farm for $1,500, and this year has 600 barrels of the finest apples. In another case a man bought a farm several years ago for $1,000. Some of his friends thought he had made a fatal mistake, but this year he has 300 barrels of fine fruit for sale. These things show what can be done on the cheap land which is for sale in New England. Not all at once—for it will require time, money, work and skill to produce first-class fruit. We feel sure, however, that the market for the finer grades of apples is sure to be greatly developed during the next few years. People who buy this New England fruit will certainly remember the Maine apples, and demand more of them.

*

THE cost of feeding a farm horse is discussed this week under "Hope Farm Notes." Some farmers who have never stopped to weigh and figure will say that $75 per year is altogether too high. They should send their horses to board at a city stable for a time and find out. City livery stables make a uniform charge of $1 a day for boarding driving horses. The wishes of the owner and needs of the horse are observed in regard to feeding and care. Stable men say that some horses are so peculiar about eating, and require so much fussing, that there is but little money in it at this price, but on the average $1 a day gives a fair profit. The charge for work horses varies from $16 to $20 per month, or a little more, depending upon the quantity of food they consume. Truck horses get little but hay and oats, and they work hard enough to have a good appetite. Of course they neither require nor get the care which is given to the driving horse, which is studied, and has his whims in regard to feeding gratified. The charge for shoeing work horses used on the pavements runs from $2.50 to $4 per month. Let a farmer undertake to feed his horse or his family on city prices for a while, and he will be far better able to appreciate some of the blessings of the farm.

*

IT has been said that THE R. N.-Y. is a local paper. Here is a little incident that throws light on the subject. A German came to this country and went to work in south Jersey. He wanted information, but did not know where to get it. A friend who lives in Wisconsin—a subscriber to THE R. N.-Y.—finally wrote to the man in New Jersey advising him to consult our paper. So we received a letter written in German, which was answered. The fact is that THE R. N.-Y. is local only in name. We have readers in Eastport, Me.; Provincetown, Mass.; Wilmington, N. C.; Orlando, Fla.; New Orleans, La.; San Antonio, Tex.; the City of Mexico; Santa Ana, Cal.; San Francisco; Seattle, Wash; Duluth, Minn.; Mackinaw, Mich.; Buffalo, N. Y.; St. Albans, Vt. Draw a line through these points and you will see that very little of the country is left outside, and the enclosure is well dotted with readers. The fact is that THE R. N.-Y. has a wider circulation than any other legitimate agricultural paper, and is truly a National publication.

*

EVERY good citizen is interested in the great problem of keeping the farm home happy and prosperous. In the cities we are rearing up a generation of the lawless, indolent and vicious. The boys and girls of the farm are more favored, because they have something to do. If only we can make their home life on the farm still more attractive, and hold them there, they will have less desire for the attractions of the city. We do not pretend to say that all the country boys and girls who come to the city fail and lose character. Quite the reverse is true, for without fresh supplies of country blood and brain the cities would fail. But where one giant comes and makes a place for himself there are five untrained and unfitted for city life who fail to make a place and simply join the ranks of the disappointed or hopeless. After a few years in the city they are often unfitted for true work in the country. Yes, the hopeful and happy farm home is now as it ever has been the best cradle for American citizenship. In every country town you will find great-hearted women who, silently and without recognition, are doing more for their country than any politician that ever lived in the town.

*

BREVITIES.

Apple! Apple! Call for apple!
Everywhere you go.
Closely watch the bill of fare,
And if apple is not there,
Then proceed at once to pare,
Cook and landlord down with care.
They will come with smirking manner,
Offering the big banana,
Or the orange—be not shaken
In the job you've undertaken;
Call for pie or raw or bake,
Sauce—no matter what you take
If you only call for apple,
Make your tongue proceed to grapple
With this plan of edueation
For an apple-eating nation.

BEFORE trying to stand on your dignity make sure that it isn't eraeked.

THEORY is as easy as eating minee pie—praetiee harder than the digestion of it.

WE want to enlist your tongue for service in the Amerlean Apple Consumers' League. Talk applies.

A GOOD deal of ink has been shed in giving advice to the girl who asked for hints about earning money. It's a good eause.

TWO great tests of friendship—to be asked to lend money without seeurity, or to give a candid opinion of another's poetry!

OIL is largely used for fuel in the engines of southwestern railroads. Northern roads have not yet attempted this oil burning.

HOW does the politieian temper his steal? He cries "save the party" to the shorn lamb—and the lamb saves it—so that he ean be shorn again.

ACCORDING to our eorrespondents on page 745, the game laws and their stringent enforcement are really a benefit to the farmers, in inereasing the demand for squabs.

REGARDING the reeent article on Duteh Belted eattle—page 690—of course, we are glad to do justiee to all. We would not willingly harm any worthy objeet or enterprise.

Is the "true steel" born in a man, or is it the fire and the hammering of life's work and trials that does the tempering? The more you hammer some people the more they flatten out.

WE are told that in California eleetrle power is transmitted from a mountain stream to a city over a wire 190 miles long. This transmission of eheap power largely offsets the lack of eoal.

IT has been reported that in Nebraska grasshoppers are eaught by the millions in "hopper-dozers," dried and pressed into eakes for poultry feeding. There is evidently some truth in the statement.

Events of the Week

DOMESTIC.—Eight railroad laborers were buried under gravel near Tioga, Wis., October 16, and four of them fatally injured. . . . . At Hamilton, O., Sylva Bishop and his wife, Leota Bishop, were indicted October 16 for causing the death of their eight-year-old daughter. They are believers in faith cure, and when the child was shockingly burned by a gasoline explosion, they refused to permit any medical attendance, treating her with prayer alone. . . . . Prominent men in the shoe, harness, leather and belting trades have united to form the Free Hide Association, in an effort to have the present duty on hides removed at the coming session of Congress. . . . . By the fall of 50 tons of rock from the roof of the rapid transit tunnel in upper New York City, October 18, five men were killed and one seriously hurt. . . . . A fire in a New York carpet warehouse October 19 caused, within 30 minutes, damage amounting to $250,000. . . . . At Chicago, October 21, thieves mined their way into the temporary post office building by means of a tunnel, and stole stamps amounting to nearly $75,000.

ADMINISTRATION.—Estimates of appropriations for the navy to be presented to Congress in December for the year beginning July 1, 1902, have been prepared. The total of these estimates is $98,910,985, which is $21,631,823 in excess of the total appropriated for the current fiscal year. The increase mainly arises from recommendations in connection with public works, the extension of yards and docks and steam engineering plants. For increase of the navy $24,000,000 is recommended, the sum appropriated last year being $25,400,000. . . . . Intervention by the United States in the Venezuela asphalt dispute may be brought about by a decision against the New York and Bermudez Company rendered by the Court of Second Instance in Cumana. Evidence to show that the decision was obtained by fraud has been presented to the State Department. If any attempt be made to put the decision into effect, and to give the Warner-Quinlan syndicate temporary possession of the Felicidad concession, the Administration will probably consider it advisable to interfere.

HAWAII.—There are now 909 lepers and 164 clean persons at the Molokai leper settlement in Hawaii, according to a report from Chief Quarantine Officer Cofer, in charge of the Marine Hospital Service in Hawaii. All these are housed, fed, clothed and governed at a cost of $80,000 a year. The report praises the hopeful and cheerful way in which the lepers resign themselves to their fate. The three oldest patients at the settlement arrived in 1874, 1875 and 1879, respectively. The number of commitments to the settlements each year during the last decade, ranging from 132 in 1891 to 85 in 1900, show a gradual decrease, despite the fact that the hunt for lepers throughout the islands never before has been so vigorous.

PHILIPPINES.—Owing to the vigilance of Lieut. Thomas M. Bains, Jr., of the Ninth United States Infantry, another slaughter of American troops by insurgents has been averted. It seems that Lieut. Bains discovered a prisoner reëntering a cell at Carbiga, Island of Samar, where several were confined, through a hole that had been let in the wall. An investigation showed a plan to fill the jail with bolomen, and to call the guard, which would be necessary to get the door open, and then to attack the garrison. It also developed that the instigators were a priest and the presidente, both of whom have been arrested, together with several other prominent persons. Other attempts have been discovered, but fortunately frustrated, at Pambujan and other points in Samar. Several persons have been arrested in connection with these. . . . . The War Department is at work on plans to send more troops to the Philippines. Several detachments must be sent home soon, and, in view of the affair at Samar, it will be necessary to keep up the strength of the army. Several of the smaller garrisons in Luzon are likely to be consolidated. . . . . October 22, Admiral Rodgers telegraphed the Navy Department that the Island of Samar was in active insurrection, and that the naval forces were all engaged in coöperation with the army.

GENERAL FOREIGN NEWS.—A very serious epidemic of typhoid fever exists at Gelsenkirchen, Germany. . . . . The efforts of the missionary agents, as reported in a cablegram from Constantinople, to get in touch with the outlaws who abducted Miss Stone, have failed. Russia has promised to assist Ambassador Tower in the search. Rev. Dr. Talmage, who will be one of the fifty to make up the remaining $50,000 of the ransom fund, believes it should be raised quickly in order to save the life of the kidnapped woman. . . . . The plague is causing fearful ravages at Foochow, China.

FARM AND GARDEN.—A swindler who represented himself as a member of a reputable commission house recently secured thousands of dollars' worth of fruit and produce from Michigan farmers. He carried stencils of the firm he professed to belong to, shipped the produce to Chicago, sold it all for cash, and then disappeared.

The annual meeting of the Maine State Pomological Society will be held at Dexter, November 6-7. The exercises will consist of one of the largest and best exhibitions of fruits and flowers ever shown in Maine, and a profusion of papers, addresses and discussions upon practical fruit and flower topics. Fruit experts will be present from Maine and elsewhere to assist. Maine fruit was never better than this year, and there is a quick market at good prices. The president of the Society is Z. A. Gilbert, North Greene; secretary, D. H. Knowlton, Farmington, Me.

The total consumption of sugar in the United States during 1900 was 2,219,847 tons. The average annual increase during the past 19 years is 6.34 per cent, which would bring the consumption during the present year up to 2,360,585 tons. Of this Louisiana produces 350,000 tons; 150,000 tons are produced from the beet, Hawaii (free) produces 350,000, and Porto Rico (free) produces 150,000 tons. The excess over domestic production is subject to a duty averaging $36 a ton, amounting in all to $84,981.60.

The twelfth annual convention of the Missouri State Dairy Association will be held at Palmyra, Mo., November 7-9. A strong programme of papers and addresses has been prepared. Secretary, Levi Chubbuck, Chemical Building, St. Louis, Mo.

The annual meeting of the Pennsylvania Live Stock Breeders' Association will be held at the Monongahela House, Pittsburg, December 18-19. An excellent programme is being prepared, including addresses by leading breeders and scientists. Secretary, E. S. Bayard, East End, Pittsburg, Pa.

Prof. F. S. Earle, until lately at the Alabama State College and Agricultural Experiment Station, has joined the staff of the New York Botanical Garden as mycologist, and will devote particular attention to the question of plant diseases.

The annual meeting of the Missouri State Horticultural Society will be held at St. Joseph, Mo., December 3-5.

The Wisconsin Cheesemakers' Association will hold its tenth annual convention at Milwaukee, January 8-10, 1902.

The Iowa Dairymen's Association will meet at Dubuque, November 12-14.

The evening of November 13 has been set aside for a big rally in favor of the Grout bill. Hon. W. W. Grout, of Vermont, father of the bill, Hon. James A. Tawney, of Minnesota, one of its most aggressive advocates in the House, and Hon. Jas. H. Davidson, who was the first to introduce a 10-cent tax measure in Congress, have signified their intention of being present, and in addition Congressmen Hangen, of Iowa, and Dahle, of Wisconsin, members of the committee who so valiantly fought for the measure when it needed friends most, will also probably be present. In addition, the dairy leaders from all over the West, including Governor Hoard and other officers of the National Dairy Union, will be on hand to take part. The object of this meeting is to give the dairymen, creamerymen and buttermakers an opportunity to hear from the Members of Congress themselves something of the necessities of the Grout bill campaign, as well as to have made clear to them conditions and prospects in the coming Congress.

The officers of the New York State Breeders' Association met at Buffalo, October 9, and selected December 17, 18 and 19 as the dates of the annual meeting, December 17 to be devoted entirely to meetings of the various National and State breeders' associations, and the other two days to a combination meeting of all the associations and breeders of live stock in this State. The sheep, cattle, poultry and dairy interests will be discussed by specialists at each session, and the "question box" will be one of the features. The Western New York Jersey Cattle Club, the Western New York Shropshire and the Standard American Merino Sheep Breeders' Associations will meet at the New Osborn House, Rochester, December 17, in connection with the State Breeders' meeting.

The Dairymen's Association of Southern California has decided to hold quarterly meetings during the year in different sections of the territory they include.

PROSPECTS FOR N. Y. GRAPE GROWERS.

It is reported in some of the papers that in consequence of the great competition from the West many grape growers in the grape districts of New York are rooting out their vineyards and planting apple and peach orchards. Will you tell us how much truth there is in this statement, as it refers to your section?

The number of vineyards that have been discontinued, or have been rooted out and planted to other fruit, is very small in this section. I do not think it would amount to eight per cent of the whole. G. L. S.
Erie, Pa.

The reported rooting out of vineyards is a fake as far as this section is concerned; in fact, the acreage has increased this last year. This district takes in 12,000 acres or more. C. C. P.
Pulteney, N. Y.

As to the vineyards being rooted out and planted to apple and pear orchards, I do not think it is the case in this section. There are some vineyards on the west side of Seneca Lake being taken out on account of the rot; but otherwise vineyardists think that their vineyards pay as well as other kinds of fruit. H. M. S.
Watkins, N. Y.

The report is not true in reference to this grape section. There is an occasional vineyard uprooted which has not paid the owner, either because of a wrong location or through gross neglect, but there are two acres planted out to every one destroyed. While there is not the big profit in grapes there was 15 or more years ago, there is no reason for discouragement. The crop is short this year, about 60 per cent of a full crop, but the demand is strong and the price good. There are a good many vineyards here that will give gross returns of $100 per acre, but, of course, that is far above the average. There is an occasional peach orchard planted, but almost no apples. E. C. G.
Penn Yan, N. Y.

There is no truth in the report that grape growers are pulling up their grapes and setting fruit trees in this part of the grape belt. I went to Westfield and asked a grower there. He says that a few grapes have been pulled up and others planted in the same place, and a few fruit trees have been set out. He has lived at Westfield working in the vineyards for the last 12 years. I know that between Westfield and Mayville, a distance of some six miles, there have been more grapes set than have been pulled out, and I know of more apple trees being pulled out than there have been grapevines. There is some alarm about the leaf hopper, a small fly that is sucking the juice out of the leaves and making them look rusty, but what they will amount to I don't know. C. D. C.
Mayville, N. Y.

I have noticed such reports. There is no truth in them as regards the Chautauqua—Erie belt. The lowest prices reached were in 1896. Bulk shipment began that year, and has increased to immense proportions. Price has improved until this year growers get more net returns than the land would produce in any use it might be put, unless it may be some special crops. A few acres have been torn out, but there was reason for it; either they were unprofitable varieties or on land not suitable. I am sure it is safe to say that the new plantings have kept the acreage fully up to what it was five years ago. Present prices paid to growers, f. o. b. loading stations, are nine to 10 cents per eight-pound basket, and $15 to $17 per ton bulk, buyer furnishing or paying for bulk packages. Offerings of bulk much below demand. Above for Concord, Niagara 50 per cent higher. The reason for the grape growers' prosperity is not very encouraging to the cause of temperance. If it were not for the thousands of tons of bulk used for wine, grapes could not be sold for half the cost of production. A. I. L.
North East, Pa.

THE MARKET OUTLOOK FOR SQUABS.

Dealers Give Encouraging Reports.

White squabs are selling at $2.50 to $2.75 per dozen; dark, $1.25 to $1.50. The trouble is that the farmers do not raise squabs good enough for the trade; that is, they place them on the market before they are fat enough. They are too much in a hurry to get them on sale.
New York. JOHNSON & REED.

We notice yearly an increased demand and outlet for squabs, particularly in the past year, owing to the scarcity of game birds in the various markets. Fancy white squabs are selling on this market at $3; second quality, $2 to $2.25 per dozen. We should think the breeding of squabs would certainly prove profitable, particularly as owing to the enforcement of the game laws throughout the country they will be wanted to replace quail, snipe and other small birds in the markets.
Chicago. LEPMAN & HEGGIE.

The outlook on squabs is very favorable. The demand is considerably better for them than it has been, and while the supply has been up to the average, they have found a much readier sale, and prices are considerably better also than what they were this time a year ago. The reason for this improvement in the demand and also in the prices, in our opinion, may be attributed to the stringent game laws that we are now having, and in consequence of which more squabs are being used than heretofore. Under the circumstances, we think that it would be safe to encourage farmers to breed more of them, and also to continue improving the breed, as we think is being done, by the number of extra large squabs that we notice that are finding their way to the market.
New York. HOEHN & MAYER.

There is a steady demand during the entire year for squabs. They are used more particularly during the closed season on other game, viz., quail, partridge, grouse and woodcock, being a good substitute. The price is governed by the supply, which is generally the heaviest during the Summer months, at which time the dealers buy the surplus stock and freeze them for later use; this keeps the market value at a fair minimum figure. There are two species which seem to be unavoidable in breeding, "white" and "dark," the first and better species being the large "white" and the second or inferior large "dark," besides which a poor grade of white and dark squabs, either too young and small, or too old and thin in flesh. Having been out of the nest and old enough to fly around in search of food for themselves they become thin in flesh, and pass the point of their best marketable value. The extreme range in our wholesale markets is as follows: May to September, large white, $2.75 per dozen; large dark, $1.25 to $1.75; mixed and small, $1 to $1.25. September to May, large white, $3 to $4 per dozen; large dark, $2 to $3; mixed and small, $1.50 to $2. It is considered unprofitable to farmers to have pigeons on their premises if allowed the same freedom as poultry, for the reason that they are particularly destructive, but if confined to a certain area, properly caged and regularly fed, the business of raising squabs for market is considered a profitable one.
New York. HANCE BROS.

THE SEASON AT THE SOUTH.

The past season has not been as satisfactory as it looked at the time I wrote you last. This section was visited by a very severe dry spell which commenced on April 19, and continued until May 19. This cut the yield of the cabbage crop 50 per cent, and the potato crop 60 per cent. Of course, the quality of both was poor and not up to the standard, and while yield was good the stock could have been of much better quality. The acreage this season will be about the same as last. Farmers are planting cabbage seed at present. Some cabbage is up and growing nicely. Farmers have made good corn and hay crops. They have all the corn and hay they need; in fact, there will be some grain and hay for sale. The corn and hay is raised on the land that the Spring crop of cabbage and potatoes is grown on. Corn will average about 25 bushels per acre; hay about two tons per acre. We use the native Crab grass for hay, some farmers sowing about one-half bushel of cow peas per acre in the land left out for hay. This mixture makes very fine forage, and our hay from Crab grass is also fine. Horses and mules prefer it to eastern or western hay. The cabbage crop will be set out in December, the potatoes will be planted in February. Around the vicinity of Charleston there is a fine large crop of strawberries set out; they look fine. We have had very dry weather for the past 30 days; consequently the Fall snap bean crop, which is shipped east in the latter part of November, is partly ruined. The Fall potato crop, which is grown by the farmers for seed for Spring, is very badly injured by the extreme dry weather; therefore, our farmers will be in the market for a large lot of Virginia second crop and eastern seed potatoes, to plant the Spring potatoes in February. READER.
Charleston, S. C.

Potatoes here are in most cases a fair to very good crop. They have sold 1,000 bushels at 50 cents, and have 400 bushels more, on my father's place, from about eight acres. Cabbage is small and blighted in many cases; worth $7 per ton at the car. There will not be a barrel of apples sent out of here this season, and many have none for their own use; $1 a bushel for wormy ones. The price of potatoes is higher, which is strange—in the middle of the harvest. Considerable rot is found.
Tompkins Co., N. Y. C. E. CHAPMAN.

Woman and Home

From Day to Day.

THE LIGHT THAT IS FELT.

A tender child of Summers three,
Seeking her little bed at night,
Paused on the dark stair timidly,
"Oh! Mother! take my hand," said she,
"And then the dark will all be light."

We older children grope our way
From dark behind to dark before;
And only when our hands we lay,
Dear Lord, in Thine, the light is day
And there is darkness never more.

Reach downward to the sunless days,
Wherein our guides are blind as we,
And faith is small and hope delays;
Take Thou the hands of prayer we raise,
And let us feel the light of Thee!

—John G. Whittier.

*

A SECOND installment of "A Trek to the South" will appear shortly, circumstances rendering the delay in publication inevitable.

*

THE postillion tails which were introduced sparingly last Winter continue to appear more freely now; they are both flat and side-pleated. Many of the Autumn tailor gowns have these tails, which are described under the general name of basquines. When made of side pleats the basquine is very flat, and may be either attached to the skirt or waist. This is a great improvement with a habit-back skirt.

*

WHEN the French housekeeper wishes to improve a tough beefsteak, she allows it to stand over night in a mixture of vinegar and salad oil in equal parts. The meat is spread out flat in a crockery dish, and the mixture poured over it. Salt or pepper is not used with it. A marinade, or savory bath of vinegar and condiments, is often used to flavor meat before cooking, much to its improvement, as in the case of beef a la mode, which gains greatly in flavor thereby.

*

WHAT is called muslin toast is sometimes served with cheese and salad, or with fruit. Rather stale homemade bread, which cuts into firm slices, is required. The bread is cut, literally, "as thin as a wafer," and spread out to dry an hour or two before needed. Then, just in time to serve, the bread is spread out on a hot tin pan, and put on the top shelf of a quick oven, just long enough to curl up a little and take on a pale shade of brown. This toast is excellent for people of delicate digestion, but is appetizing for anyone. It is frequently the custom now to serve cream cheese and fruit jelly together as a latter course at dinner, and muslin toast is a very desirable accompaniment.

*

A WESTERN correspondent asks how to make Worcestershire sauce. This is a proprietary relish, its mode of making and ingredients kept secret for a century or more. Green walnuts appear to form a part of the original sauce, whose red labels, bearing the three pears displayed upon the shield of the ancient city of Worcester, are familiar everywhere, and cassareep (the boiled sap of the cassava) is doubtless another ingredient, but we do not believe that it has ever been imitated with entire success. The following recipe is recommended as a homemade Worcestershire sauce: Five pints best cider vinegar, one-half pound small sliced vinegar pickles, one-fourth pound crushed mustard seed, one-fourth ounce of celery seed, also crushed, one bunch minced garlic. Cook the foregoing ingredients in a granite kettle until reduced to four pints. Into a second granite kettle put one ounce crushed ginger, one-fourth ounce cloves, one-fourth ounce cayenne pepper, one pint India chutney, four pints of water, and cook until it boils down to four pints. Put both into one kettle and cook one-half hour. Let it cool. Cut the rind of three lemons in small strips and brown in the oven, then put into the cold sauce. Cover and let stand 10 days. Then draw off and strain into bottles.

*

THE idea of skinning a pearl sounds exceedingly extravagant—yet it is not an impossibility. A friend of ours possesses an old-fashioned ring set with a fine large pearl. In course of time the jewel lost its luster, becoming blackened and dead. Our friend stored it away for several months, when, happening to look at it, she discovered that the surface of the pearl was cracked, and apparently peeling off. Being a woman, she began to scrape off the cracked surface with her manicure tools, and was astonished to discover a perfect and lustrous surface beneath. After thus shedding its coat, the pearl looked as though fresh from the jeweler's hands. Speaking of this to an expert, he told us that the shedding of the coat itself was not remarkable because the pearl consists of a series of concentric layers deposited upon some irritant particle introduced into the oyster shell; the remarkable feature of the incident was the fact that the secondary layer was perfect and without blemish. It is, however, an uncommon incident; the only moulting pearl we are acquainted with.

*

WHAT to do for closet room is often a puzzling question where proper provision has not been made in building. One woman whose accommodations were limited solved the puzzle thus: She purchased a plain kitchen clothes horse six feet high, made with flat slats instead of round. Her next purchase was six yards of a very bright and pretty art fabric, and following this purchase was a liberal supply of fancy gilt headed tacks. In order to make the covering secure, a strip of wood was placed at the bottom of the triple folds of the clothes horse. The drapery was then stretched to cover the wood completely. Small upholstery tacks were used for fastening and later the fancy ones were placed at regular intervals. Each fold of the clothes rod was covered separately, the leather strips that originally served as

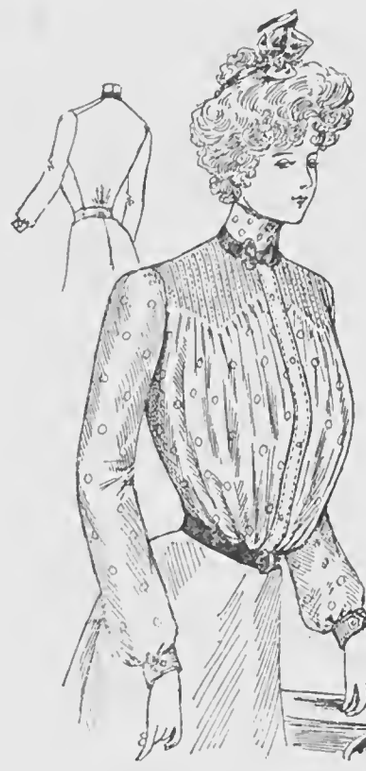
3933 Woman's Three-Piece Skirt, 22 to 30 Waist.

hinges were replaced by fancy brass hinges, and the clothes horse was converted into an artistic screen. A couple of dozen clothes hooks were inserted in the inner side of the screen, thus transforming the screen into a closet that served as a decorative as well as a useful addition to the sleeping apartment.

PEOPLE lift their eyebrows over women mastering the higher mathematics; why, it is infinitely more difficult to learn the details of good housekeeping. Anybody can learn mathematics, but it takes a lot of skill to manage a house well.—William Morris.

The Rural Patterns.

Skirts with circular flounce still remain in high favor, the example shown having a much graduated effect which is very fashionable. The upper portion is cut in three pieces and is fitted snugly about the hips, the fullness being laid in inverted pleats. The flounce is narrow at the front but widens suddenly to run well up at the back, making a specially desirable model for wide fabrics. The fan pleat is a novel and fashionable feature, besides which, it adds to the flare and freedom about the feet, but when desired the flounce can be made plain. To cut this skirt for a woman of medium size, 8½ yards of material 21 inches wide, 6¾ yards 27 inches wide, 5½ yards 44 inches wide or 4⅝ yards 50



3932 Woman's Shirt Waist, 32 to 42 Bust.

inches wide will be required. The pattern No. 3933 is cut in sizes for a 22, 24, 26, 28 and 30-inch waist measure; price 10 cents from this office.

The pretty tucked waist shown is made over a fitted lining, but the lining can be omitted if desired. The back is plain, drawn down in gathers at the waist line; but the fronts are tucked to form a pointed yoke, below which they fall in soft folds which can be arranged in gathers at the waist line or left free to be adjusted to the figure as preferred. The edge is finished with a box pleat and the neck with a stock. The sleeves are in bishop style with narrow pointed cuffs. When the waist is unlined, the gathers at the waist line are stayed with a band of the material, or a casing is applied and tapes inserted by means of which the fullness is regulated. Otherwise the process of making is unchanged. To cut this waist for a woman of medium size 3⅝ yards of material 21 inches wide, 3½ yards 27 inches wide, three yards 32 inches wide, or 2⅛ yards 44 inches wide will be required. The pattern No. 3932 is cut in sizes for a 32, 34, 36, 38, 40 and 42-inch bust measure; price 10 cents.

THE oldest trouble in the world comes from want of understanding.—Kipling.

That Busy Life Again.

In the issue for August 24 I read the experience of a busy farmer's wife. After reading it the second time I had come to the conclusion that she must have been a perfectly healthy woman with a very strong constitution, or she would have given out under the burden of all those years. My experience has been that there is a limit to each one's power of endurance, and I think that some of the sisters will agree with me in saying that if we go beyond the limit we must suffer the penalty, which means nervous prostration, or something worse. I would not encourage idleness, and think one far happier for working, and while we can detect just a little spirit of egotism on the part of the busy woman who tells of her work, at the same time we cannot but admit that she was very smart to accomplish so much, and praise is her just due for leading such a useful life.

A CONNECTICUT READER.

THERE are great truths which every honest heart may be assured of. There is such a thing as a serene, immovable conviction. Faith is a deep want of the soul.—Christian Register.

The Girl on the Farm.

WHAT MONEY-MAKING OCCUPATIONS ARE OPEN TO HER?

The following question which was printed on page 696, has excited much interest among our readers, and some of their opinions and experiences are now given:

Seeing many helpful things in THE R. N.-Y., I now write to ask you whether you know of any work I could do at home. I am 20 years old, live on a farm, and I am staying at home to help Mother with the work.

A Woman Poultry Raiser.

Tell the young girl in the country to take up caring for poultry, and she will find it a good job and a profitable one, for what money is invested in it. I have done so for years, besides doing my housework for four or five, and also making from 20 to 30 pounds of butter a week, and the poultry brought me the most money and the easiest work of it all. I only keep from 30 to 35 hens and pullets and two cockerels, and cleared every year from $60 to $80 on them. Once in a while it would reach $100. I have now for 12 years kept a steady account of all, debtor and creditor, and can give you the full list. I feed well; they have all they can eat three times a day, and little chicks oftener, but of course they must have some care. If the inquirer wishes to write to me I will give her my way of feeding and caring for them, as I should like to interest country girls in poultry work for their spending money. MRS. H. S.

Connecticut.

Poultry and Flowers.

In answer to the inquiry of the girl on page 696, why could not she, with her father's or brother's assistance, engage in the poultry business in a light way, and the net profits of the business into the young woman's pocket would be as much as many a working girl's salary above her board and laundry bills. She might take up floriculture. Besides the many flowers she could sell she could get a little fortune by exhibiting at the Fall fairs, and the premiums would be duplicated by some of the seedsmen, if she bought her seeds from them. I know of instances where both of the above ideas have been carried out by young girls on the farm with good paying results, and 70 per cent of their time devoted to helping Mother; and then the satisfaction of being "your own boss" is everything. YOUNG FARMER.

Ohio.

A Bunch of Suggestions.

We are asked how a young country woman who is staying at home to help her mother with the work may earn some cash, and we are moreover told not to theorize but to tell what we know *has been done.* Well, here goes in an attempt to comply, first being allowed to say that we will give this young woman credit for the expression of a desire that is something more than a vague aspiration after the unattainable. But has she really a set purpose to earn some money, and the necessary will power and physical force to make her keep on trying until she finally succeeds? If she has her parents must give her a chance, and help her by every means possible. A young woman in the country may keep bees. They will work for her while she is helping her mother. She may raise ducks or chickens if she can have facilities for keeping them separate from the farm hens. This has been successfully done by many women. She may nurse into vigor the weakling lambs that would otherwise be allowed to perish, and have their wool and affection for her pay. This also has been done, and the money was used to pay the cost of a serious but successful surgical operation. She may rescue and raise into value the runt pigs until they are fit to kill. She may "dressmake" if she can and will. She may "make over" the women's hats for a small fee of 50 cents each if she has a knack for it, or perhaps she can acquire the art by study and practice. I have just heard of a woman who made money mending for Summer boarders, and of another who sold patchwork quilts, unquilted.

She may dry fruit. Tons of fruit are allowed to rot on the ground that might be turned into cash by nimble fingers. I would advise the use of a small evaporator that would sit upon the stove. They could be bleached and neatly packed into empty starch boxes, and would always sell. This is a good field for home work, as it is admitted that much of the dried fruit as it comes from the large evaporators is not carefully prepared, and needs to be looked over and trimmed over before it is used. A nice appearing package of strictly fine dried fruit sells readily. A friend in a village sells all she can make of daintily prepared pot cheese. Another sold for $5 to a New York seedsman two ounces of carefully saved tomato seed of a new sort. A large essential oil factory agreed to take all the pennyroyal that could be gathered, and the sheep fields were full of it. Another friend had a large grape vine of a new kind and sold every eye that could be cut off to a propagator for five cents each.

If this young New England girl likes flowers well enough to be willing to know them thoroughly and could love them well enough to get down (or up?) among them in order to succeed in their cultivation, let her father set aside half an acre of his best land near the house in plain sight of the road, and manure it as heavily as if he were about to grow asparagus and then turn her loose in it until she had worked up "a flower patch" that would just astonish the natives. Let her fill it full of all sorts of hardy plants in great rows; the brilliant brightly-colored hardy Phlox with their immense panicles of bloom lasting for months, Iris, Delphinium, roses, etc. Have a nice big sign painted "Plants for Sale," and nail it up in plain sight. That would keep off beggars. No matter if some one does say: "Ain't it mean! Betsy Smithers won't give a body even the least little speck of one of them flowers of her's, and I hinted I would like a mite ever so much." Every such remark only advertises the business, and the fact that it is run on a strictly-cash-one-price-to-all basis, and brings customers from all over the country.

She might also rig up a homemade propagating bench. (This also has been done.) A big drygoods box with a false bottom set in amidships, with three inches of coarse moist sand on it, with a B burner oil lamp burning under it for bottom heat, and she could then strike all manner of plants from cuttings full as readily as the florists, and sell them for cash. She might raise seedling plants in the odd moments. They certainly would grow for her gladly while she was dutifully helping her mother with the work, and finally, sisters, where there is a will there is a way. In fact, there are several ways, and doubtless many more than have here been mentioned. Make your choice.

New York J. YATES PEEK.

Rural Recipes.

I dearly love these Autumn days;
With joy my heart throbs high,
The frost is on the pumpkin, and
The pumpkin's in the pie.
—Phila. Record.

Pumpkin Marmalade.—Four pounds of yellow pumpkin, 4½ pounds of sugar, half a dozen lemons and half a dozen oranges; cut the pumpkin into very small dice; mix the sugar with it and let stand over night. Peel the oranges and lemons with a very sharp knife, and boil the rinds two hours, changing the water twice. When the rinds are cold trim off as much of the white part as possible to prevent bitterness. Put the ingredients all together in a preserving kettle, and boil for two or three hours until the right consistency is reached. Place in jelly glasses, and keep in a dark, cool place.

Banana Pie.—This is nothing more than a custard pie improved by sliced bananas. Line a pie dish with a rich crust and let it cool. Slice two large bananas into the crust. Boil one cupful of milk, one-half cupful of sugar, the yolks of two eggs, and two tablespoonfuls of cornstarch until thick. Let this custard cool before pouring it over the bananas. Make a meringue of two egg whites beaten stiff with two tablespoonfuls of sugar and pour it over the pie. Set in the oven just long enough to brown.

Snipdoodles.—One cupful of sugar, one tablespoonful of butter, one-half cupful of milk, one egg, one cupful of flour, one teaspoonful of baking powder, one teaspoonful cinnamon. Cream the butter, add the sugar, then the egg, well beaten; then the flour, baking powder and cinnamon sifted together, and the milk. When nearly done sprinkle with sugar. When brown remove from the oven, cut into squares, and remove quickly with a knife. They should be thin and crispy.

Grape Pickle.—Pick sound grapes from the stems without breaking them and put them in a jar. For every seven pounds of the fruit allow a quart of vinegar, three pounds of brown sugar and a tablespoonful of whole cloves and stick cinnamon, boil together for a few minutes, and when cold enough to bear putting the finger in pour over the uncooked grapes. Cover jar with a saucer and do not disturb for two or three weeks.

18 Infant's Barrow Coat and Under Shirt, One Size.

3911 Child's Frock, 6 mo., 1, 2, 4 yr.

Angel Cakelets.—Beat the whites of four eggs and half a level teaspoonful cream tartar until stiff; sift together half cupful fine granulated sugar and half cupful of flour; add gradually to the eggs. Flavor with quarter teaspoonful of almond. Bake in little cake pans. Sprinkle with powdered sugar and bake in a moderate oven 20 minutes.

Santa Clara Prune Cake.—Two cupfuls of sugar creamed with one-half cupful of butter, three eggs (whites beaten separately) two-thirds cupful of sweet milk, one heaping teaspoonful of baking powder, one tablespoonful of powdered mace, one cupful of chopped walnuts, one cupful of chopped prunes that have been steamed. Line a cake pan with buttered paper, fill in a layer of the cake batter, spread a layer of the chopped prunes and over this put a layer of the nuts, then another layer of cake, and so on until the pan is two-thirds full. Bake in a steady but not quick oven.

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

SORE NECK

Take Scott's Emulsion for scrofula. Children often have sores on the neck that won't heal up. The sores may come and go. Parents may not know what's the matter nor what to do. Scrofula is the trouble and Scott's Emulsion is the medicine.

Scott's Emulsion heals the sores. But that is not all. Scrofula leads to consumption. This is the real danger.

Scott's Emulsion is the "ounce of prevention" that keeps off consumption.

We'll send you a little to try, if you like.

LAND values have undoubtedly risen here slightly in the last few years, and a decidedly better feeling exists. No manufactures or emigration here. A. R. L.

Barboursville, Va.

BUSINESS BITS.

THE R. E. Dietz Company, 87 Laight Street, New York, makes a liberal offer to readers of THE R. N.-Y. Look up the offer and try your hand at writing an advertisement for the famous Dietz lantern. It will be good mental recreation, even if you do not win a slice of the $300 prize money.

THE Mietz & Weiss gas and kerosene engines make a very creditable showing in machinery hall at the Pan-American Exposition at Buffalo. These engines are well adapted for farm work, a number of them being in use for different purposes on the farms of readers of THE R. N.-Y. Write to A. Mietz, 128 Mott Street, New York, for particulars.

MANAGER F. F. PROCTOR has inaugurated a new departure in theater entertainments that is meeting with great success. He has four theaters in New York, one in Albany and one in Montreal, making six theaters now in active operation. His select company of 150 players is divided into six sections, and the tour of the six theaters is made, so that each house has a new play each week. Old comedies, farces and laughing plays are revived and presented with every attention to detail, and between the acts of the plays and before and after the dramas vaudeville numbers were introduced. In this way the long and tedious waits usually attendant upon the ordinary dramatic presentation are obviated, and the entertainment is continuous. Everyone who visits New York wishes a night's entertainment at the theater, and the attractions at Proctor's are surpassed by no house in the city.

BRONCHIAL CONSUMPTION.

From Dr. Robert Hunter's Lectures on Lung Diseases.

Of the many forms of Bronchitis, the one most alarming of all is that in which the symptoms closely resemble those of consumption, and hence called consumptive bronchitis, or bronchial consumption. You must not, however, understand from its name that it is really tuberculosis in character, or produced by the bacilli which cause true consumption.

In all lung cases I require a portion of the expectorated matter coughed up by the patient to be brought to me, or sent in a small bottle by express, before giving a definite opinion of the disease. If, on examination, I find the tubercle bacilli present, the case is consumption; and if no bacilli—Bronchitis. A large percentage of those who die of lung disease, supposed to be consumption, are really deaths by chronic bronchitis resembling consumption.

A remarkable instance in verification of this recently occurred. A lady was brought to me in what appeared the last stage of consumption. Her physicians had told her husband that she could not live a week. She had a bad cough, puriform expectorations, night sweats and was wasted almost to skin and bone. Judging by her symptoms and appearance, it was impossible not to fear that she had come too late. On sounding her chest, however, I was surprised to find no solidification by tubercles, and on examining her sputum a total absence of the bacilli. The history, too, of her sickness revealed that it had followed an attack of whooping cough and grippe So, although her pulse was 120 a minute, and so feeble as to be hardly perceptible, and the wasting of her body so extreme that she could not stand without support, I did not hesitate to pronounce the disease bronchial, and give it as my opinion that, if we could sustain her strength long enough for remedies to act, she would be saved. She was immediately placed under medicated air treatment, with tonics to impart appetite and digestives to help the enfeebled stomach to transform nourishments into chyle and blood. Within a week she showed signs of improvement. Her progress was necessarily slow, as the healing power of the body were nearly exhausted before the first inhalation was given, but she gradually acquired more and more strength, and within six weeks was able to take short walks in the open air. She recovered perfectly in about six months, and is alive and well to-day.

This case shows the importance of a correct diagnosis and proper adaptation of the treatment of the conditions to be remedied. Had the true nature of her disease not been discovered just when it was, she would have lost her life through wrong treatment, and been recorded as another death by consumption.

Every form of bronchitis is curable by local antiseptic and healing remedies applied directly to the lungs by medicated air inhalation, but none of them by stomach treatment. The stomach is not the part affected. The air tubes and cells of the lungs are the seat of every bronchial disease, and unless remedies capable of changing their bad secretions and healing the inflamed tubes are applied to them, cure is impossible.

GLENN RANCH,

Glenn County, California,

FOR SALE IN SUBDIVISIONS.

This famous and well-known farm, the home of the late Dr. Glenn, "the wheat king," has been surveyed and subdivided. It is offered for sale in any sized government subdivision at remarkably low prices, and in no case, it is believed, exceeding what it is assessed for County and State taxation purposes.

This great ranch of 40,000 acres runs up and down the western bank of the Sacramento River for 15 miles. It is located in a region that has never lacked an ample rainfall, and no irrigation is required.

The river is navigable at all seasons of the year, and freight and trading boats make regular trips.

The closest personal inspection of the land by proposed purchasers is invited. Parties desiring to look at the land should go to Chico, California.

For further particulars and for maps, showing the subdivisions and prices per acre, address personally or by letter,

F. C. LUSK,

Agent of N. D. Rideout, Administrator of the Estate of H. J. Glenn, of Chico, Butte County, California.

To Our Friends, Club-Raisers and Agents.

The R. N.-Y. 10 Weeks for 10 Cents.

We have set out to get 20,000 new trial subscriptions by January 1, 1902. May we ask you to help us get them? To make it easy for you we are going to send the paper to the new subscriber the 10 weeks for 10 cents. No intelligent farmer will refuse you an order on these terms. To make it an object for you to help us we are going to send 23 cash premiums as New Year's presents to the 23 persons who have sent us the 23 largest clubs up to January 1, 1902. These will be as follows:

First Largest,	**$25**
Second Largest,	**15**
Third Largest,	**10**
Ten next largest $5 each,	**50**
Five next largest $3 each,	**15**
Five next largest $2 each,	**10**

These premiums will be awarded on the basis of 10 weeks' trials. Every sueh order will count one, and an order for a new yearly subscription will count 10. These premiums are in addition to regular commissions. Renewal of old subscriptions will not count for the premiums, because we want to make this a special effort to get our 20,000 new names. But the commissions will be allowed on the new and old names alike. If you have not already received the regular commission rates, blanks, samples, etc., send for them. We look for all our old friends to take a personal interest in this matter, and send us a club, be it large or small. Don't delay until the last week. Begin at once.

THE RURAL NEW-YORKER, NEW YORK.

MARKET NOTES

POTATO PRICES have declined still further. The highest figure now given is $2.25. The chief reason for this drop is the inferior quality of a large part of the receipts, many of which go for $1.25 to $1.75 per barrel. The crop of Aroostook County, Maine, is reported to be very heavy, although there is considerable damage from rot.

ORANGES are in this market during the whole year; but the local fruit trade is considerably interested just now in the first receipts from Porto Rico under free trade. The fruit thus far has been inferior and poorly packed, and prices have run considerably below California and Florida stock. The Porto Rican orange matures earlier than the western or Florida fruit. The trade generally expects a rapid development in the Porto Rico orange business, as a number of experienced growers who have suffered from frosts in northern Florida have gone to that Island. A few Florida oranges have reached New York, but they were so green that buyers did not take hold of them very well. The crop is estimated to be less than the average, owing to unfavorable weather.

BUYING BY LABEL.—"That's the kind I want," said a man who was looking for grapes on a fruit stand. "I have had that man's pack before, and know they are all right." He picked up a four-pound basket labeled Niagara white grapes 723, paid 20 cents for it, and did not go through the usual performance of loosening the cover and holding the basket bottom side up to see that the fruit was uniform. Evidently he had considerable confidence in number 723 of that brand. Out of curiosity I bought a basket from the same lot, and found that the buyer was not mistaken. The grapes were well ripened, and this makes at least 50 per cent difference in the quality of Niagaras. A great many are picked and shipped when about the color of Paris-green, and by the time the consumer gets them they are insipid and watery. A ripe Niagara with the bloom on is yellowish white with a faint shade of green showing through the skin. The grapes in the bottom of the basket were as large and fine as those on top, and the fruit had been packed so closely that it had not been bruised in handling. At each end of the cover was tacked a strip an inch wide and three-eighths inch thick. This raised the cover slightly, so as to leave an air space between it and top of the basket. Retail buyers are good people to be friendly with, and it would be hard to find a better way to get acquainted with them than by putting up the fruit under a label that stands for quality, and living up to it strictly. Of course buyers do not expect that every basket of perishable fruit will be equally good, for some may be kept too long before selling, but they appreciate the attempt to protect them from the dishonest practices of those who try to make the good fruit sell the poor by mixing it.

W. W. H.

THE entries for the Pan-American poultry show call for 2,000 large poultry. There are 550 bantams, 140 turkeys, 110 ducks and 25 pheasants, which are all single birds. In addition there are 185 breeding yards and three displays which contain 950 birds, making a total of about 4,000 birds; besides 1,865 pigeons.

THE WEST THROUGH EASTERN EYES

PART II.

HOME SURROUNDINGS.—One peculiarity of the country that strikes an eastern man is the small low houses and lack of barns or outbuildings. The farmhouses are almost exclusively one-story buildings. They are usually square or nearly so, the roof coming to a point or apex over the center, and slanting down on all four sides, making eaves all around the house. I suspect this construction is built with a view of exposing the least possible surface to the winds. Another invariable protection from the winds is the "wind-breaks." These are clumps of trees which have been set to the windward side of the house to protect it from storms. Sometimes they quite surround the house, and cover considerable area, while others are small in extent and flank one or two sides of the home. Another thing one notices as peculiar is the general lack of fruit and kitchen gardens. We were told that they had no time for such small things. It is greatly to be regretted, because both fruit and vegetables could be produced in great abundance, and would add much to the appearance of the home and the comfort and living of the family. On the other hand, every family, even in the villages, seems to keep a few chickens, and some places appear to give considerable attention to this industry.

LARGE FARMS.—The farms are laid out in sections; that is in tracts one mile square, contain 640 acres. Some of these are cut up into half and quarter sections; but a farmer seems to feel that he has something to apologize for when he operates only a quarter section of 160 acres, the tendency and ambition being to operate large farms. Farm help is scarce, and one man often operates a half section, or even a full section of 640 acres alone. This scarcity of help, together with the tendency to run large farms, and the wonderful productiveness of the soil, all combine to account for the slipshod appearance of things which we in the East call improvident. Of what use are cornstalks or straw when there are no cattle to eat them, and why take the trouble to burn a stack of thrashed straw, when there are lots more rich fertile ground like that under the stack? Then what a waste of time it would seem if one spent a half day with small seeds in a garden, when the drill or planter could distribute bushels of wheat or oats on broad acres in the same time? The western plowman, like the eastern farmer, is a great deal the product of his environment, and he is subject to conditions which he has not been entirely able to control, but which he is fast learning to bring under his dominion. As I passed rapidly through his fertile fields, with its windmills and homes shaded and protected with blocks of trees that he himself had set, with roads that he had built, and railroads that he had made possible, and remembered that 30 years ago this had been a trackless prairie with scarcely a sign of habitation, and entirely barren of trees, I communed with myself that these must be a rugged sturdy people. I thought to myself that they had done more for civilization and future ages than the men in manufacturing and commercial circles, of whom we heard so much, because of the millions they have accumulated. I made up my mind then and there that the farmers of the East had nothing to fear from the competition of their honest products in the markets of the world; and that the men who subdued those stubborn prairies, watered their surface, and baffled their storms, would never help to perpetrate a fraud on the honest products of the East. I found them in council as I had pictured them—rugged, sturdy, honest. Plain and frank themselves they are quick to see through sham and hypocrisy. Perhaps a bit sensitive, and for that reason quick to resent a sentiment where no offense or wrong is intended; yet generous to the extreme. He would voluntarily suppress his own interests when justice and right favored his competitor or neighbor. Social functionaries may sneer at his rough exterior and grammarians may deride his awkward speech, but his communion with nature, his independent thought, and habit of doing things, have given him a power of expression and a culture of mind that the city-bred man can neither appreciate nor imitate.

J. J. D.

Exhibition of New York Florists' Club.

The first annual exhibition of the New York Florists' Club was held at Madison Square Garden, October 21-27. The immense hall was filled with one of the finest collections of ornamental plants and flowers ever brought together in the city. Separate days were given to the general exhibition, roses, carnations decorations and Chrysanthemums. The attendance was very good, especially on the closing day, which was given over to the Chrysanthemums. The show of vegetables was much larger than expected for the season and generally of fine quality. No potatoes showed up to better advantage than Sir Walter Raleigh and other Rural New Yorker varieties. A few good apples and many splendid glass-grown grapes comprised the fruit exhibit.

The great feature was the magnificent collections of decorative plants shown by many exhibitors. Palms in immense sizes and great variety, ferns, bamboos and specimen evergreens in bewildering variety made the hall a bower of greenery. The groups of flowering orchids were probably the best ever seen here. The brightest feature of the show was a large group of Kniphofia Pfitzerii, recently illustrated in these columns, and the next plant in brilliancy was plainly Clerodendron fallax, shown in a group of well-grown specimens. Some fine naninized or dwarfed conifers from Japan excited much interest. They were fine specimens, and it was a comfort to find none was claimed to be more than 100 years old, instead of the incredible ages often assigned to these twisted little monsters. Some vases not over 12 inches in diameter contained miniature pine forests of 50 trees. The pines were less than two feet high, bright and healthy.; one or two bearing cones. Clipped bay trees in large sizes made a very noticeable feature, the formality of which was well balanced by many particularly well-grown rubber trees. The premiums were very generous, and fortunate exhibitors were well rewarded for their trouble. This first effort of the New York Florists' Club was very successful, and similar exhibitions are likely to become a permanent feature of its operations.

W. V. F.

One Man Saved

From a wreck will attract the world's attention to the life-saver. Yet let the life-saving be continued every day, and very soon it attracts no public attention. If the scene of the saving of one life by that life-saving remedy, Dr. Pierce's Golden Medical Discovery, could be made to stand out alone, like a picture on a screen, it would attract the notice of the whole nation. By a curious contradiction the very frequency with which the "Discovery" saves life, robs the fact of general interest. For obstinate coughs, bronchitis, weak lungs, and other diseases of the respiratory organs, "Golden Medical Discovery" is the one medicine which offers certain help, and almost certain cure. It contains neither alcohol nor narcotics.

"Only for Doctor Pierce's Golden Medical Discovery I think I would be in my grave to-day," writes Mr. Moses Miles, of Hilliard, Uinta Co., Wyoming. "I had asthma so bad I could not sleep and was compelled to give up work. It affected my lungs so that I coughed all the time, both day and night. My friends all thought I had consumption. My wife insisted on my trying 'Golden Medical Discovery.' I have taken four bottles and am now a well man, weighing 185 pounds—thanks to Dr. Pierce."

The People's Common Sense Medical Adviser in paper covers, is sent free on receipt of 21 one-cent stamps to pay the cost of mailing *only*. Address Dr. R. V. Pierce, Buffalo, N. Y.

Live Stock and Dairy

THE BEST SHEEP FOR ORCHARDS.

I have a small orchard of about an acre, and have been thinking of trying Mr. Woodward's plan of putting sheep in to eat fallen fruit. What breed ought I to get? I want them to be quiet and peaceable, and, of course, expect them more than to pay their way. I started Alfalfa last Spring. If it should prove a success, how would it work to feed the sheep Alfalfa hay instead of bran? READER.

I should not attach much importance to the breed selected for this purpose. Any one of the common middle-wool sheep, such as Shropshire, Oxford, etc., will do. Of course the Merino is more restless than the middle or long-wool breeds. Gentle, quiet handling of sheep will nearly always result in the flock becoming very tame, and easily managed. The writer has had a small flock of sheep in an orchard all this past Summer, and it has been a decided benfit to both sheep and trees, for all fallen fruit has been eaten, and so insects have been destroyed in large numbers. Alfalfa hay is largely fed to sheep in Colorado, they being fitted for the Chicago market. The Colorado Experiment Station reports that a lamb eats about 400 pounds of hay and 120 pounds of grain. The lamb is put on Alfalfa for about two months, after which grain is gradually fed, until about a pound a day is given. Bran is not needed so much when Alfalfa is used, and cracked corn or wheat are used instead. Of the two grains, I should give corn the preference over wheat. If the idea is to feed the Alfalfa hay in Winter, instead of bran, that will do, but to keep the sheep in the most profitable condition a light feed of corn should be fed beside, and also a bit of oil meal will give good returns on the investment. C. S. PLUMB.

No breed equals the common American Merino for this purpose. The English or so-called mutton breeds are not good scavengers; they have not been "brought up that way," and put into an orchard 10 or 15 to the acre could hardly be fed enough to make them thrive. Besides this, they do not take as kindly to a diet of weeds, sprouts, fallen apples and bran as do the Merinos. There is another objection to the mutton breeds; they are far more apt to injure the trees by bunting and rubbing against them. Any sheep, if fed every day, will be quiet and peaceable, but the Merino excels all others in tractability. Where one feeds them regularly they will get so tame as to be all about the feeder and hard to keep from under foot. As a part of the supplemental food the Alfalfa would be first-class, but it would not be best for the orchard. The manure resulting would be too rich in nitrogen and would be deficient in both potash and phosphoric acid. While bran is high priced and seems a very dear food for sheep, yet to feed in the orchard there is nothing that can take its place. In a ton of Alfalfa hay there would be about 46 pounds of nitrogen, about 10 pounds of phosphoric acid, and 29 pounds of potash, while in a ton of wheat bran 53 pounds of nitrogen, nearly 58 pounds of phosphoric acid, and 33 pounds of potash, so although bran nowadays is pretty high in price, it is by far the most desirable supplemental food for use in an orchard. I would be glad to have our inquirer put 15 Merino ewes into that acre of orchard, provide them with an abundance of water, and feed them enough Alfalfa hay and wheat bran to keep them thriving, and next Fall report appearance of orchard and character of fruit. J. S. WOODWARD.

I FEED hens and pullets scorched wheat and cracked corn, with plenty of separated milk. Pullets that are expected to lay in Winter should have good care from first start. If allowed to shift for themselves in Summer and Fall they will not lay in Winter. W. W.

East Clarendon, Vt.

PROFITABLE PENNSYLVANIA HENS.

Our hens are mostly B. P. Rocks crossed with the Buff Leghorns. I think they make as good layers as we find for both Fall and Winter. One thing you must do if you expect a hen to lay is to take care of her, and do it from the time she hatches until she dies, just as you must do with anything you expect to make money from. From the time mine are hatched in Spring(and the earlier they are hatched the better) I see that they are well fed; not all they can possibly stuff, but enough so that they will start off bug-hunting with that contented little peep that tells of a happy chick. They always have all the water they can drink. I take no special care of my pullets until the roosters are large enough to shut up and fatten; then I shut the roosters by themselves and let the pullets run. In the morning I give them (the pullets) a light feed of bran and meal, about two-thirds bran to one-third meal, mixed with water or milk, but not too much milk. At night they get a feed of wheat, corn and oats, using buckwheat instead of wheat when I haven't the wheat, and when I have both mix them. I feed one-half wheat, one-fourth corn and one-fourth oats; sometimes less oats, and more of the others. Some object to the oats, but I think it makes the hens stronger. This is what they get in Fall.

In Winter they get about the same in feed, only more of it, and I usually feed the soft mash at night, and have it warm. I often cook them little potatoes or steam them a kettleful of oats, buckwheat and wheat. They like that the best, and I fix it about three times a week, stirring in enough bran and meal to make it like their soft feed. We send to the meat markets in the city and get the steamed and dried scraps that are prepared for hens, and feed that two or three times a week, a quart for 20 or 25 hens in their soft feed. My hen roost has two parts and as my hens all run together I use one part to feed them in and in the other put about six inches of chaff of some kind, in which I scatter all hard grain to make them scratch. That is why I feed whole grain in the morning, so they will be busy all day. They only need to sit on the roosting pole at night. They have warm water to drink, all they want; oyster shells and a box of road dust to wallow in. At noon they get cabbage or some other raw vegetable to eat, and they will eat almost anything that is green in Winter. Don't let them out on the cold ground or in the snow.

I do not expect pullets to lay before they are 5½ or six months old, as they must have time to get their growth. My old hens get about the same care as the pullets. I always sell off all or nearly all of those that are two years or over, and keep only the yearlings and pullets. We find it pays better; as the hens get older there are always some that will not lay, and only eat up the profit of the others. We keep the roosts as clean as possible, well ventilated, but no drafts. The hens are as nearly healthy as we can keep them, and we trust to nature to do the rest. We usually get eggs, if not as many as we would like, but the pullets must have time to grow, and the old hens to moult. E. L. B.

Hop Bottom, Pa.

The Holstein-Friesian Test at the Pan-American.

The arrangements for this test were made at short notice, as it was not decided to hold it until about two months before the week which was to be devoted to the cattle exhibit at the Pan-American. It was evident that cows for such a test should be in fresh milking condition. No cows had been bred with this object in view, and it is well-known that all breeders avoid having their cows freshen during "dog days," except for some special exhibit. The committee finally found 15 cows, four of which had calved. They were all put in temporary quarters near Buffalo, where the remaining calves were dropped. They were kept there until September 9, when nine of them were selected for the test and driven to the Pan-American grounds. The cows and their products were as follows:

2000 FERRETS. First-class stock. Some Trained. New price-list free. N. A. KNAPP, Rochester, Lorain Co., O

Collie Pups—Spayed Females. Circulars. SILAS DECKER, South Montrose, Pa.

Death to Lice on HENS and CHICKS. 64-page book FREE. D. J. LAMBERT, Box 307, Apponaug, R. I.

Cockerels—Choice W. Wyan., P. Rocks, Brahmas, Cochins, Leghorns, from prize-winning stock. 23 varieties of land and water fowls. Satisfaction guaranteed. Big catalogue free. Pine Tree Farm, Box T, Jamesburg, N. J.

NO SPAVINS The worst possible spavin can be cured in 45 minutes. Curbs, splints and ringbones just as quick. Not painful and never has failed. Detailed information about this new method sent free to horse owners. Write today. Ask for pamphlet No. 34. FLEMING BROS., Union Stock Yards, Chicago, Ill.

HIGHEST AWARD
CREAM SEPARATORS
BUFFALO EXPOSITION.

Just as in the case of every representative exhibition or other contest since the invention of the Cream Separator twenty years ago, the De Laval machines have maintained their supremacy at the Pan-American Exposition, Buffalo, having received the Gold Medal on Cream Separators.

This is the highest and only award of its kind on Cream Separators. One other make of machine has received a Silver Medal, and another concern a Gold Medal for its *combined exhibit* of cream separators, Babcock testers, churns and other apparatus. With characteristic advertising honesty, the latter concern is now claiming this Gold Medal to be an award to its separators.

OTHER GREAT EXPOSITIONS.

The supremacy of the De Laval machines at Buffalo is a continuation of their triumphant record at all previous great expositions. At the World's Fair, Chicago, in 1893, they received the Gold and only medal awarded by the regular jury of awards and were the only separators used in the Model Dairy. At Antwerp in 1894 and at Brussels in 1897 they received the Grand Prizes or highest awards. At Omaha in 1898 they received the Gold Medal, and again at Paris in 1900 the Grand Prize or highest award.

DISGRUNTLED COMPETITORS.

All kinds of lying and misrepresentation upon the part of disgruntled would-be competitors and imitators cannot change or detract one iota from any one of these facts.

DUTCH BELTED CATTLE.

Their Pan-American Record Explained.

In your article on the great Pan-American dairy test in THE R. N.-Y. of October 12, you do the Dutch Belted cattle an injustice. True, this breed is "close to the tail of the race," and doubtless many people have inferred that the reason was about as you stated in your article. But there are other reasons. Some may even think that there are *no* good cows in this breed. To such let me say that Cyrene No. 315, an old cow, that I sold for beef in January, 1899, gave 196 quarts of milk in one week, in June, 1897, with no grain, and only very ordinary pasture. Her daughter, Fern No. 781, now six years of age, has always calved in December; but, should she come fresh in Spring, I think she would give as much or more than her dam ever did. Lady Baird No. 82 gave 32 quarts per day at the World's Fair. Queen gave 70 pounds a day for seven days on pasture alone, and milked 14 years without going dry, breeding yearly. How much longer she would have bred yearly and milked continually cannot be known, as she was burned to death when 16 years old.

You may ask: "Why were not such cows selected for the Pan-American Model Dairy?" There are probably not more than 200 mature cows of this breed in America. The owners of many of these exhibit stock at the fairs annually, and have their cows come fresh at that time, that they may be in good show condition. Other owners, like myself, make a specialty of Winter milk and also have their cows to come fresh in the Fall. Breeders of other breeds of cattle planned for the contest a year in advance and had their best cows freshen the last of April of this year. Then some cattle associations bought 10 of the best cows of their respective breeds that could be procured, that would be fresh the last of April and sent them to the Exposition grounds a few days before May 1, and some of them actually calved after their arrival. These cows were tested and the best five selected for the Model Dairy, and were rested from their journey ready for business when the contest began. Understand me; I am not charging other cattle associations with underhand methods. They only did what in my opinion the Dutch Belted Cattle Association should have done, but neither the Dutch Belted Association nor individual breeders of Dutch Belted stock made any previous preparations for the contest, and two of this breed did not reach Buffalo until the contest was three weeks under way. The Dutch Belted cows were not strictly fresh, but had been milked two or three months, and some of them were so old as no longer to be prime cattle.

In substantiation of the above statements I will say that early in April I asked Mrs. Servin, who owns one of the largest herds of Dutch Belted cattle, and who exhibits at many fairs, and is also a member of the executive committee of the Dutch Belted Cattle Association, whether any of her cows would be in the Model Dairy. She replied under date of April 8: "I believe that the Dutch Belted cattle will not compete. Compared with the other breeds we have so very few cattle to select from that it is doubtful whether we could make a good showing. Personally, we could not possibly enter more than two, as others will not be fresh at that time." After this another breeder concluded that the Dutch Belted breed must make a showing in the Model Dairy. He had one cow that he thought would do to enter, and he got Mrs. Servin's consent to enter her two; then he engaged Mr. Sanders to look after this breed during the six months' contest at Buffalo. But there were still needed two cows to make up the five required, and these two were not forthcoming. The first of May was almost at hand, and other fresh cows could not be found, so he added two more from his own herd. Under date of May 1 he wrote me: "Sanders took three of my cows to Buffalo—not what I would have liked to send, but my best cows are too near dry. I gave him instructions, if any other breeder sent cows, to dispose of two of mine, and only keep one in the Model Dairy."

Mr. Richards, secretary of the Dutch Belted Cattle Association, who is an expert judge of dairy cattle, and who has seen most of the mature cows of this breed, had written of one of my herd: "I don't know of a better cow for the Model Dairy than Lady of Warren." Then I was requested to enter her. But she did not come fresh till July 3, and, of course, this practically barred her from the contest. The only cow I had to become fresh this year earlier than that was Lady of Warren's daughter, Electress, a two-year-old heifer, who calved May 10. She was due—counting nine months—April 28. Mr. Sanders and Superintendent Converse did not think the cows representative animals of the breed, and renewed the search for other cows. On April 29 I received four telegrams from them and others, and they urged me to forward my heifer. I refused to ship her before she calved. On May 1 Mr. Sanders came to my place to see her. He decided not to take her because she, though of good size and very promising for a two-year-old, was not as large as the mature cows, and he liked to have the cows of the Model Dairy herd of uniform size. Here is where outside appearance took the place of performance! In the meantime Mrs. Servin got the idea that the intention to enter Dutch Belted cattle in the Model Dairy had fallen through, and was surprised about that time to receive a telegram from Buffalo stating that her cows had not yet arrived. No wonder, they hadn't started. Well, after unavoidable delays they were started, but did not get there to enter the contest till May 21—just three weeks behind time. Considering these and other facts it is no wonder that the Dutch Belted cattle are "close to the tail of the race." It would be about as reasonable to sow grain on the unplowed earth and expect a full harvest as to expect any but the best cows of any breed to win laurels in such a contest. The color characteristic of these cattle was established hundreds of years ago, and it is scarcely ever that it is not transmitted. No, we don't have to reject our best animals because they are "off color."

G. G. GIBBS.

Warren Co., N. J.

IF you have that kicking cow yet I would like you to take a strap or rope and put it around her just forward of the hips and udder, and draw tight; then buckle or tie. Should she continue to kick tighten the strap or rope. I have never known this plan to fail.

Uncle Sam is Out Again with His Blandest Smile.

HE WON

THE GOLD MEDAL

AT THE

Pan-American Exposition

in spite of the "would-be competitors," fiercest opposition, who imagined that everything was fixed to come their way, and who had a lawyer in their interests almost constantly at Buffalo; but, oh! what a disappointment when they found that they were not the "Only Pebble on the Beach."

Our "would-be competitors," the De Laval Separator Co., rehearse at great length their view of how the U. S. Separator beat them at the Pan-American, but the fact remains just the same that the U. S. did beat them by its work in the Model Dairy.

Now, to draw attention away from the actual workings of the Separators, these "would-be competitors" begin to shout "fire" and talk much about sparks that caught in the roof of some boiler-house instead of giving the actual tests of the Separators.

These "would-be competitors" go back to the World's Fair, Chicago, and state "they received the gold and only medal awarded by the regular jury." Everybody who knows anything about that Fair knows that the De Laval Company received no Gold Medal, and all they got was a Bronze Medal.

It is true they did have the jury fixed to their liking, and that jury turned everybody down but themselves, but when it was shown to the Fair officers that this jury was made up of De Laval agents and partisans, they immediately appointed a new jury, and that jury **awarded the Vermont Farm Machine Company twelve medals of highest merit** on its different articles of manufacture; twelve times as many awards as our "would-be competitors" the De Laval Company got.

At Paris, 1900, the De Laval Separator Co. had no exhibit or Separators. Their foster-father, the Aktiebolaget Separator of Stockholm, Sweden, did have a big exhibit, but no prize was awarded them by the regular or class jury. When the class jury was examining the separators, our representative urged that the separators be tested to prove our claims of superior merits, and also presented a written request that such tests be made, but was informed by the jury that the De Laval Company's foster-father, the Aktiebolaget Separator, objected to tests, claiming that it would take six months (three in Winter and three in Summer) to make reliable tests.

Every one knew this was only for a bluff to prevent tests, and the jury so looked upon it, and gave the Aktiebolaget Separator no prize, and the official list of the prizes published and distributed at the Paris Exposition did not contain any award to the Aktiebolaget Separator or the De Laval Separator Co.

The Aktiebolaget Separator Co., of course, were dissatisfied, and appealed to the Grand or Superior Jury. They got the King of Sweden to make a personal appeal to the jury for them when he was on a visit to the Paris Exposition, and also the Swedish Minister to France, and the Swedish Commissioner-General to the Exposition made personal appeals to the Grand or Superior Jury in behalf of the Aktiebolaget Separator and its child, the De Laval Company, and made it a political matter, so that it is now reported that when the revised list of prizes, which is not yet published, is issued, it will contain notice of an award to the Aktiebolaget Separator Co.

The above statement can be proved as correct. The De Laval Company and their foster-father had to get the King and the Minister and the Commissioner to use their political influence before they could get an award at Paris, and then only on an appeal to the Superior or Grand Jury.

We ask the dairy public how much that reflects on the merits of the De Laval Separator, and who it is that does the "after pulling and hauling which unsuccessful exhibitors always resort to?"

The United States Separator has been awarded the GOLD MEDAL or the Highest Prize at EVERY INTERNATIONAL EXPOSITION where it has been exhibited since its manufacture.

We are always pleased to send illustrated circulars for the asking.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. LX. No. 2702. NEW YORK, NOVEMBER 9, 1901. $1 PER YEAR.

APPLES INJURED BY SULPHUR FUMES.

HOW THE DAMAGE IS DONE.

Results of Practical Experiments.

Since the season has arrived when the fruit growers are beginning to consider the questions of storage, and, more immediately, the preparations of cellars and storehouses, any bit of information relating to the subject of storage may not be out of place. Here I wish to bring up a point regarding the fumigation of cellars. At the last meeting of the Western New York Horticultural Society I had occasion to observe some Northern Spy apples, which were injured in a peculiar manner. The specimens were submitted by a fruit grower from Medina, who stated that a serious loss had resulted to some stored apples from this injury. The injury consisted of depressed, pale, straw-colored areas over the entire surface of the skin. Some of the spots were small and rounded, but over a large part of the surface they had run together, forming large sinuous blotches. The accompanying picture, Fig. 342, page 754, will give a good idea of the character of the injury, although it was not possible to photograph the specimens until several days after they had been received, and they had consequently begun to decay. When cut open, the flesh just beneath the discolored skin was dead, and of a dry, spongy consistency. Otherwise the flesh was uninjured, but decay soon followed in the spots.

These apples had been sprayed with Bordeaux and Paris-green in the usual way, and were in sound condition when placed in cold storage. Here some of them had begun to decay, and to prevent this the cellar had been fumigated with sulphur, after which the injury described appeared. The spraying with Bordeaux is mentioned because an injured Baldwin was submitted which was said not to have been sprayed, and the injury in the first case was attributed to the fact that the apples had been sprayed while on the tree. From the nature of the treatment, it was not difficult to find the cause of the injury, but since neither the grower nor several fruit men present seemed to be acquainted with its cause, I will take this opportunity of explaining the effect of sulphur fumes on apples. To give the matter a fair test, the following little experiment was performed. About a dozen apples of Northern Spy, Baldwin and Mann were placed in a vessel containing a little over a cubic foot of space. Some were sprayed with water, and a few were covered with Bordeaux Mixture, while the others were left dry. About 10 grains of sulphur were burned in the vessel, the fruit being subjected to the fumes for nearly an hour. At the end of this time the Northern Spies were seriously injured, the whole surface being covered with spots. See Fig. 341, page 754. The Baldwins were less severely injured, while the Mann apples were practically untouched. These differences in the extent of the damage may be due to varietal differences in the apples, or to variations in the degree of ripeness. The presence or absence of water on the surface of the apples caused no perceptible difference, although the drops showed strong acid reaction after the experiment. It is needless to say that the Bordeaux had no effect whatever. The skin of the apple is generally impermeable to the fumes of sulphur. By an examination of Fig. 341 it will be seen that the injured areas appeared around the lenticels or "spots" of the apple. These are pores, which exist for the purpose of permitting gaseous interchange between the outer air and the interior of the apple, the cuticle generally being impermeable to gases. Note the large injured areas at points where the skin has been mechanically punctured.

The probable direct cause of the damage done by sulphur is the formation of sulphurous acid. Whenever fumes of burning sulphur come into contact with water or water vapor this acid is produced. To this reaction the slight disinfecting power of sulphur is due. The acid is formed from the moisture in the flesh of the apples after the fumes penetrate the breathing pores. From the foregoing, it is clear that cellars containing fruit should not be fumigated with sulphur. If it is desired to kill molds and other fungi, the cellar should be thoroughly cleaned and fumigated before the fruit is put in. This will prevent such losses as that occasioned in this instance.

H. HASSELBRING.

Geneva (N. Y.) Experiment Station.

R. N.-Y.—We are glad to have this clear explanation of the effects of sulphur fumigation. There have been many efforts to destroy scab and rot on living fruits and vegetables by burning sulphur. Most of them have failed.

ROSE CLOTHILDE SOUPERT. FIG. 340. SEE RURALISMS, PAGE 758.

APPLE-GROWING ON GRASSY HILLSIDES.

HOW GRANT HITCHINGS RAISES FINE FRUIT.

Sod Orchards and Low Heads for Early Bearing.

It was in the latter part of September that Prof. Beach, of the Geneva Experiment Station, and I went to Syracuse, on our way to South Onondaga, to see with our own eyes the orchard of Grant Hitchings. Col. A. C. Chase, of Syracuse, drove us out behind a lively pair of young horses. It was a beautiful drive of about 12 miles, south of Syracuse, through the Onondaga Indian Reservation, and among the hills of Onondaga County. At first glance, one would not pick this out as an ideal fruit-growing section, for the land is very rough, and the average Niagara or Orleans County fruit-grower would be rather at a loss what to do with it. As we drove along, Col. Chase called attention to the numerous apple seedlings along the roadside, some of them very old trees, and we found that in many places the hillside is spotted with them, even competing with the wild second growth of the woods. On some of the hillsides these natural-growth apples are so thick that if top-grafted a fair orchard would result, and we noticed as we passed by that many of the apples were of good size and color. In fact, close observation would lead one to suspect that the soil and conditions are peculiarly adapted for apples.

Mr. Hitching's orchard was pointed out as we were in sight of the place, and the first thing that we noticed was that the trees did not appear to have been planted regularly in rows. The results that Mr. Hitchings obtains from his method of apple culture are almost beyond belief, and must be seen to be appreciated. We saw 11-year-old trees that were yielding 15 to 18 bushels of fruit, and apple trees bearing paying crops at six years from setting. Prof. Beach said that he could hardly believe the statements made regarding this orchard, until he had seen it for himself, and found that they had not been exaggerated in the least. It is a mistaken idea that Mr. Hitchings's trees make little growth. His idea is not to force that growth. The young apple trees set over one year were making a growth of from 18 inches to two feet, equal to that of most young cultivated orchard trees. Of course the heavy bearing of the older trees will check the growth to a great extent. The foliage at the time of our visit was very large and green, and gave one the impression of luxuriant growth. One of the peculiar features of Mr. Hitchings's method of culture is setting in sod. His bearing orchard is in straight rows one way, and the other way at irregular distances, so as to avoid the ridges. He stated that the trees did not do well upon them, and he had tried to place the trees as much as possible in the depression upon the side hill. There was no cultivation; the first 10 years the trees are mulched with the hay cut between and around the trees, after that letting grass lie where cut.

The trees are headed low, many of their branches starting at 18 inches to two feet from the ground. No pruning is practiced. Whether it is the local conditions or the result of Mr. Hitchings's culture methods that cause his trees to bear at such a young age, I am unable to say, but it seems to me that the

secret may lie in one or more of the following points: Sod culture; the sod taking up the elements of fertility in the Spring, prevents an excessive wood growth. This grass being cut in early Summer, decays and gradually gives up its fertility during late Summer and Fall, when it is most needed fully to develop and strengthen the fruit buds and carry to maturity a crop of apples. He does not trim; that is, cut back the young growth of the tree, or cut off any branches except those that are necessary to the good health of the tree. This in itself is conducive to early bearing. I have noticed that if the end of young growth is not cut off, the terminal bud is likely to make a rather short growth the year following, and the side buds to develop into fruit spurs. If the terminal bud is cut off, several of the side buds will send out strong, thrifty shoots, while the buds below fail to develop. It may be that the low heading of the tree has something to do with the early bearing and high color of fruit. It is a question whether these apple trees that are headed low bear heavy crops before ordinary trees begin to fruit at all, or will ever grow as large as trees grown in the usual way. Mr. Hitchings tells us that as a rule they bear annually. It seems to me that his 11-year-old Pewaukee trees were of about the ideal size, 12 to 15 feet high, and yielding about 18 bushels of apples to the tree, three-quarters of which could be picked from the ground.

These are some of the advantages of the method of culture. Early bearing, easy picking, easy spraying, easy to fumigate if necessary, high color, annual crops on young trees, a short fall for the fruit upon a mulch, almost all windfalls salable as picked apples. It requires less labor and attention than cultivating and sowing and plowing under of cover crops, and the results that he gets surpass anything that I have seen in the apple-growing line. Just think of one to two bushels of Spy, and double that quantity of Duchess and Wealthy on a six-year-old tree; nine-year-old Greenings and Baldwins, with five or six bushels of fruit, and trees of many more varieties at that age, all bearing. We could even occasionally find apples on trees that had been set only three years. Would it be advisable for apple-growers over New York State to adopt Mr. Hitchings's methods, and would they get the results that he does? I don't know, but believe that it is quite possible, and would advise any fruit-growers who live among the hills to go and study his methods and conditions. Go when the fruit is on the tree, and see the results. I know that those sturdy, short-legged trees had a business look, and filled baskets with fruit, while trees grown in the usual way were getting size. It certainly looks as though one need not wait until an apple orchard is 20 years old for a crop of fruit. V.

A NEW SCHEME FOR ADULTERATING MILK.

The following item is going the rounds of the press: "A new milk adulterant has been discovered in use by the dairy inspectors in Minnesota. It is called viscogen, and is composed of sugar, lime and water. It has the effect of making milk appear richer than it is, as the lactic acid in the milk turns the lime to a thick, white substance that assimilates with the milk, improving its looks without injuring its taste." We sent this to Dr. S. M. Babcock, the inventor of the famous milk tester, and he replies as follows:

Viscogen is prepared by dissolving caustic lime in a solution of cane sugar, and was first recommended by Dr. Russell and myself as an agent which could be used without detriment to health for the restoration of the consistency of Pasteurized cream, which is very much thinner than natural cream, containing the same amount of fat. In natural cream the fat globules are to a considerable extent grouped together in masses, containing all the way from two or three to several hundred globules, while in Pasteurized cream the globules are uniformly distributed. The thinner appearance of Pasteurized cream is due to this fact. It was found that viscogen caused the fat globules to become grouped in a similar way to natural cream, and that the consistency was in this way restored. The amount of viscogen required to accomplish this is very small, so that the lime introduced is scarcely more than the difference found in natural milks from different sources. Before publishing our bulletin, leading physicians were consulted regarding the sanitary effect of this addition, and without excepton, we were told that it did not injure the cream; in fact, most physicians recommend the addition of lime water to milk for children and invalids, as it is supposed to promote its digestibilty. We also consulted legal authorities, and were told that viscogen could not be considered an adulteration if the consumers are informed of its use. Under these conditions only have we recommended it. The customers of the University Creamery all prefer cream treated in this way to natural cream. Wherever viscogen has been used in the manner recommended by us, there seems to be no objection either from a sanitary or legal point of view. In this respect it differs widely from the ordinary preservatives and adulterants that are added to milk. I presume, however, that in many cases unscrupulous parties have used it to deceive their customers regarding the richness of cream, and wherever this has occurred the penalty for adulteration should be strictly enforced, although no injury to health is likely to result from such practice. I very much regret that this substance, which was originally intended only to benefit the consumer, has been misused in this way. S. M. BABCOCK.

CAN WE EAT CORN CAKE AND HAVE IT?

The question of silage as Winter food for farm stock is quite an important one with me, as it also is with thousands of farmers who have silos, and fill them

SULPHUR SPOTTING OF NORTHERN SPY. Fig. 341.
One-half Natural Size. See First Page.

nearly every Fall. It is also an important question with thousands of farmers who have no silos, and are from year to year, wintering their stock in the old way, on dry fodder, with, perhaps, a little grain to cows that are in milk. This latter class of farmers cannot be said to be *all* non-progressive, because a great many of them are watching and noticing the varied success of those who have, and use silos, and as they become convinced of their utility and economy, proceed to build, and fill them on the most approved plans and practices obtainable. The practice of filling silos with corn in the glazed state, running the whole product through the cutter, ears and all, is getting to be pretty well understood, and the measure of success where the silo is tight, and the silage reasonably well tramped, is very good, and farm stock, including milch cows, dry cows, store cattle and horses, will relish and thrive on it, if a little straw is added to the ration. But the greater question with me is, how to cut and preserve dry cornstalks with the ears off, so that the product will come out of the silo in an eatable and appetizing condition. If you will give this question to Prof. King, or some other of your practical and valued contributors (who as yet have said little or nothing in their articles on this subject), and who will give us practical directions now to preserve cured cut fodder in silos, you and they will deserve and receive the thanks of thousands of farmers who are anxious to learn how to practice economy in the matter of wintering farm stock.

EFFECT OF SULPHUR FUMES ON APPLE. Fig. 342.
One-half Natural Size. See First Page.

I have tried it with more or less success by cutting quite short, say half an inch, wetting and tramping thoroughly. I think when I succeeded the best was when I used the most water, so that the material packed well, and was quite firm, excluding the air as much as possible. The mass would heat and ferment more or less, and soften the hard portions of the stalks so that stock would eat them up quite clean, and seem to do well on them with a small grain ration. We are all, as farmers, keeping more or less stock, such as dry cows and store cattle, that will winter fairly well on fodder, with but little grain, but the milch cows and work horses must have grain. If we put the fodder and grain all into the silo together, all the stock must share alike, unless you add more grain, raised for that purpose, from the bin, to the cows in milk and work horses. Now, why cannot we let the corn stand and ripen, pick off the ears, or cut and husk in the old way, silo the fodder and crib the corn to grind and feed when needed, and where it will do the most good? Some of our large forehanded farmers may say that the labor required in husking, cribbing and grinding the corn is unnecessary, and a waste, when the fodder and grain can all be stored in the silo by one operation, but I must differ with such, for we usually find the bottom of the silo by the time grass is up enough to pasture in the Spring; then our corn is gone (unless we raise an extra piece to harvest in the old way), and we want corn all Summer for our poultry, pigs, horses, and, perhaps, some for our cows, when the pastures get short and dry, and the prospects are that from now till the corn harvest of 1902 it will take quite a bit of labor to buy a bushel of good, sound corn, to say nothing of the bushels that farmers must have to tide them over. E. G. O.

Wysox, Pa.

R. N.-Y.—A few years ago there was quite a discussion regarding this plan of husking corn and cutting the stalks into the silo late in the Fall. Several of our readers were very enthusiastic about it, and in theory it seemed like a fine plan for utilizing the corn crop. We did our best the following year to learn how the theory worked out. We were unable to find a single man who cared to repeat the work. If there are any who follow the plan year after year, we would like to hear from them, for their experience will be of great value. We think our friend is right in saying that on most farms a certain amount of dry corn is necessary. By running the dry stalks through a shedder, we have found it possible to save our dry grain and provide cheap Winter roughage for all the stock.

PAINT OF LIME AND SKIM-MILK.

Several R. N.-Y. readers wish to know more about the milk and lime paint mentioned on page 675. There is no cast-iron rule for mixing it; no mysterious chemical affinity; no drier; no failure, if everything is not weighed to an ounce; and, in fact, it is a most accommodating mixture. It is necessary to keep it thin, for if it has much body, like other paint, it will flake off; but on rough boards, like unplaned hemlock, it may be much thicker than on a smooth surface. We do not try to put on enough so that the lumber will not show the grain when dry. Of course to get a uniform result, all the paint for any one job should contain the same proportions of milk and lime. Any kind of milk, sweet or sour, or even buttermilk, will answer. Use water lime, not stone lime or cement. It can be bought in paper sacks, and needs no slaking. I use for unplaned surfaces, one-half pound of lime to a pound of milk, stirring thoroughly, and then stirring in the coloring matter to suit. Keep the mixture well stirred while putting on, and stir well from the bottom of the tub before dipping out a second supply. You cannot mix it so that the lime will not settle some. On this account, I would not mix more than a 50-pound butter tub full at a time. C. E. CHAPMAN.

ROOT-PRUNED TREES IN MEXICO.—I will not argue further with Mr. Trott, page 690, as to how far north a root-pruned tree will succeed, but certainly as far as a piece-root graft will grow, the two being practically identical, but I do seriously object to the impression he makes that root-pruning originated in Mexico. Texas Farm and Ranch has quite a number of subscribers in that country, who, reading my articles on the subject for the last 10 years, have written me frequently as to its adaptability to the coffee tree. I have always advised them to root-prune, and exactly as Mr. Trott describes, and G. M. Clark, of Lugunas, Oaxaca, had the nerve, like Mr. Hale, with the peach in Georgia, to set out a great many thousand coffee trees that way with perfect success, though strongly advised against it by old planters.

H. M. STRINGFELLOW.

NORTHERN EXPERIENCE WITH COW PEAS.

A Heavy Growth in Pennsylvania.

The photograph shows a *single* volunteer plant of the Black Renovator cow pea, which grew in the garden at Woodbine Farm the past season. This plant completely covered a circle 12 feet in diameter. The stem was three-quarters of an inch in diameter where it entered the ground, and was still growing rapidly when taken up, September 23. This plant did not come to the blossoming stage, owing to the abnormal season. Last year the Black Renovator matured seed on this same ground. Cow peas have come to stay at Woodbine Farm. It was formerly claimed that this plant was of doubtful value this far north (latitude of Cleveland, O.), but our experience has proven the error of such claims. We have grown chiefly the Early Black, but have also tried other varieties, notably Warren's Early and Renovator. On the whole, the Early Black gives as good growth of vines as any. Besides, the seed is much cheaper to buy and much easier to shell, if we save our own seed. With us all the varieties mentioned matured seed in 1900.

In the season of 1900 we sowed a bushel of Early Black on 1⅛ acre of thin land, which had been in meadow for a number of years. The ground was plowed and fitted during the second week of June, and on June 15 the seed was drilled in with a nine-hoe grain drill, running three hoes, this making the rows wide enough to admit of cultivation. Twice during the season we went through them, once to the row with the Planet Jr. 12-tooth cultivator. At the last cultivation we sowed a plot to Crimson clover, a plot to turnips and one to oats. This was some time after the middle of July. The grasshoppers destroyed the clover, and the growth of vines smothered out the turnips and oats. These peas ripened a full crop of seed. We saved enough for our own sowing, and left the remainder on the field—not the most economical thing to do. Early in the Spring of 1901 we plowed the vines under and planted potatoes. The soil was noticeably of a darker color and in finer physical condition where the peas grew. We applied several loads of good barn manure along one side, and bordering on the plot where the cow peas grew. Our potato field extended clear across both the cow pea and manured plots. The potato crop was slightly better upon the manured portion. The potatoes ripened several days earlier upon the portion which had been in peas. The tops of the potatoes were a darker green where we used the cow peas. As the matter appears to us now, we made the following mistakes in this experiment: We did not use enough seed; we should have used acid phosphate and potash in the drill when sowing; we should have saved the crop of seed; the vines should have been plowed under and the ground seeded to rye in the Fall.

The past season we plowed and prepared three acres for cow peas, this time turning under a liberal growth of grass and weeds. The peas were sown June 15, in the same manner as above described, except that we used 100 pounds per acre of high-grade complete fertilizer. We cultivated them three times. Owing to extreme wet, growth was slow at the first and but few pods were matured when killed by frost on the night of October 6. The growth of vines was satisfactory, with the exception of a few wet spots. These vines will be plowed under, and rye sown, together with as much ground lime as the drill will apply. This land is intended for potatoes next season. Our favorite method in the future will be to mow a portion of our meadow land, say during the fore part of June; immediately fit the soil and seed to cow peas, using a small quantity of chemicals; as soon as the vines are frosted, plow under and seed to rye, using lime, the rye to be turned under the next Spring for potatoes. Soy beans have promise with us. We shall try sowing a mixture of cow peas and Soy beans next season. In theory, this seems to us an ideal method; how it will work out in practice remains to be ascertained. J. T. C.

Hartstown, Pa.

Good Success in Massachusetts.

June 28, 1896, I sowed cow peas in a worn-out pasture—light, sandy soil. In October, after several severe frosts, I plowed in the peas—a light crop—and sowed rye. In the following Spring the rye was plowed in and corn planted, with no manure to speak of. The result was a crop of corn, which was a surprise, considering the soil, due to the peas. These were the Black. Since then I have sown cow peas every year, for green manuring and fodder, with good results, using the Whippoorwill, which is smaller, earlier, and makes a better growth than the Black. This variety readily matures a crop here in central Massachusetts. During the season just closed I tested another variety, the Warren, which is three weeks earlier, and does not make as large a crop. For green manuring there is an advantage in having the crop nearly matured, as it is then much richer. If not matured, they should be well frosted or cut and partially dried before turning in, as there is danger of souring the soil by turning in too large a mass of very green matter, requiring lime as a remedy. Cow

MRS. COW PEA TAKES THE CHAIR. Fig. 343.

peas, which are not peas at all, but beans, must not be sown until it is safe to plant corn or other beans. On good soil they make a tremendous amount of green fodder, which is good feed until after frosts. If cut off early, they make a lighter second growth. They produce a large mass of roots, which with the coarse stems and the pods and beans, are rich in nitrogen, and excellent food for the soil, and (except the

TALL CORN ON LONG ISLAND. Fig. 344

roots) for the cow. Some cows must learn to like them, but this they will do if mixed with other green feed which they like. If they are pastured, cows eat the leaves and tender tops, leaving the coarse stems and roots for fertilizer and humus in the soil. After haying, you can sow the Whippoorwill as late as July 5 in this region, where we had no severe frosts until October 4 and 5, obtain a large quantity of green feed, and have left also a large mass of roots and stems for fertilizer. If the land is plowed again and rye sown as a cover crop, and to prevent waste of nitrogen, it is in good condition for the Spring crop, without manure. If manured, so much the better. If the vines are not plowed in, much of their nitrogen is lost during the Winter. I have found them especially adapted to sandy soil, but they also do well on clay, especially if sown in rows and cultivated. But for building up and renovating worn-out soils, there is nothing like them, so far as my experience goes. They will grow on soil so poor as to be unable to raise anything else. I have always sown them alone, not with other crops. H.

So. Hadley, Mass.

Report from Northern New York.

I live in the southern part of Warren Co., N. Y., and that is pretty well north. We have sown cow peas for the last five years; have found the seed rather expensive to buy, as we had to pay $3 per bushel the past Spring for Black. This year we raised about 25 bushels of Mt. Olive, from seed we grew last year. We saved about one-half bushel of Black last year, but none seeded this year. We planted this year about the middle of June. One piece of Mt. Olive was podded well; another, planted the next day, did not have a pod. They were planted with Eclipse corn planter in drills, as I wished to save seed. It was quite a job to pick them, and brought a good many grunts from the boys. We thrashed with a thrashing machine; it broke lots of them, but I tried a flail with about the same results. We generally drill them in with grain drill, and plow under in Spring for manure. I think it would be better to plow under in Fall and sow to rye, and turn that under in Spring for corn.

I have one plot of about two acres this year of Black, sown broadcast by hand, and dragged in about July 8, that has made a growth of about two feet, and was a perfect mat of vines when frost struck it, October 5. We think they are a grand thing for our light, sandy soil; would as soon have a good growth of cow-pea vines to turn under as the general run of manure we buy, and it is a great deal cheaper. Last year I had sweet corn on cow-pea ground. I plowed on one side, where there were no cow peas, wide enough for two rows, and did not get one ear of corn on these two rows, while the other was good corn. F. P. W.

Glens Falls, N. Y.

Seed Grown in Latitude 43.

We are situated about three miles from the New Hampshire College of Agriculture, in latitude 43. In 1900 we planted a few of Salzer's Prolific cow peas, just to try them. I do not know the exact date of planting. They made a fine growth, and were cut and fed to the cows before seed matured. In 1901, June 8 and 11, we sowed about four acres of the land where we planted silage corn to the same variety. After marking off the ground in rows about 3½ feet apart, we dropped the silage corn by hand, one kernel in a place, from 10 inches to one foot apart; then went over the ground again at a rapid walk, dropping the peas, one, two or three, in a place, as it happened, and, perhaps, two feet apart. We covered both corn and peas with a two-horse hoe. You will observe that the peas cost us nothing but the seed, and the dropping, a mere trifle. Now, as to results. On the major part of the four acres the peas came up well, and flourished, nearly covering the ground under the corn. We were hoping that they would climb the cornstalks, so that we could cut them with the corn, and let them go into the silo. This they failed to do to any great extent, so we pulled many of the vines before the corn was cut, feeding the vines to the cows with green corn fodder. The cows were crazy for them, eating them up root and branch, and increasing their yield of milk. There were many ripe pods on them for the past three weeks. In the future we will plant them by themselves. We note in our farming that the land where we had beans and other legumes in 1900 gave us much better crops this year than land beside it planted to oats in 1900.

New Hampshire. H. M. DE R.

TALL CORN ON LONG ISLAND.—I noted the article on a "Two-story Cornfield" in your issue of October 12, with interest, the height of it being stated as 14 feet, but I can go that one better. I enclose a picture (see Fig. 344) of corn on my place which is 16¼ to 18 feet in height by actual measurement, which you can judge by the picture. The seed was sent here by a corporal at Angeles, Luzon, Philippine Islands, but he says it does not grow to that height over there. It was planted without any care or cultivation, and with an idea that it wouldn't grow here, not to speak of its enormous height. The corn is red, round, bead-like, and very easy to shell; the stalks are very hard and strong, withstanding the winds better than the domestic, regardless of its height; the leaves are long, wide and sweeping. It has attracted the attention of many on the street, and wagers have been made on its possible height; even the local papers have commented upon it. W. C.

College Point, L. I.

FARMERS' CLUB

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Barberry and Asparagus Rust.

A. L. J., Chateauguay Basin, Canada.—Is it at all likely that a barberry hedge said to breed mildew can convey it to plants of asparagus near by? Is this true as said of the barberry?

ANS.—There is no evidence to support the idea that mildew on barberry plants will infect asparagus with rust, though the barberry is well-known to act as host for the Orange rust of wheat and rye. The fungi affecting the barberry and asparagus are of different species.

Cooking Food for Stock.

C. C. Z., Norwich, Conn.—Do you think cooked grain is better than raw for stock in general? If so, how much will it pay to bother to cook it?

ANS.—We have used a cooker for five years. It pays best for potatoes, turnips, and other bulky food. We find it very useful for hogs. A warm breakfast right from the cooker does them good, and we think it pays to cook all such food. Whole corn and cornmeal are improved by boiling in cold weather, but we have not found it profitable to cook the nitrogenous foods, like bran, oats or linseed meal.

Using Bisulphide of Carbon.

E. S., Lionville, Pa.—I have about 250 bushels of wheat in a good granary just over the cows. It is infested with the Angoumois moth, and with weevil. The lantern is used in the stables morning and evening. If I treated this wheat with bisulphide of carbon, would I endanger the cows or run any risk from fire?

ANS.—No, under ordinary circumstances there will be no danger. Of course the grain bin is tight. The bisulphide would do but little good unless the bin is tight enough to hold the gas. We are advised to put blankets or bags over the bin to prevent the escape of the gas. In a well-ventilated stable there would be no danger, but to make doubly sure you can use the bi-sulphide in the morning after the cows are turned out. You will not kill the insects unless you make the bin airtight and keep it covered.

Peaches for Central New Jersey.

C. McM., Westfield, N. J.—What varieties of peaches do you think are best to set an orchard containing 500 trees, to have five kinds to ripen in succession? I have been thinking of Mountain Rose, Oldmixon, Stump, Late Crawford, and Stevens Rareripe. Soil is clay loam with traces of iron. How do Spitzenburg, Oldenburg or Jonathan apples do in this section and soil? Northern Spy does not do well here; keeps poorly. Baldwin does well. I believe in planting fruit of high quality, as I think it will pay in the end.

ANS.—The varieties you mention are excellent for your locality. We would suggest that some Triumph be worked in for early use, and that Chairs Choice be substituted for Late Crawford. You would run some slight risk with these newer varieties, but the chances are that they would please you. Jonathan apple should succeed well with you, but Spitzenburg has never been satisfactory as far south as New Jersey.

To Confine a Spring.

C. B., Windsor, Conn.—In a pasture in the rear of the house I occupy there is a very fine spring which I would very much like to confine and make easier to get at. It is in the side (at the bottom) of a hill. Can some of your readers advise me as to the best plan to do this, something permanent, but not too expensive? If I could bring the water nearer the house (perhaps to a spring-house) it would be more convenient.

ANS.—If I understand this question correctly the inquirer wishes to confine the water in his spring and pipe it to his residence. We should dig at the head of the spring and find whether at the depth of two or three feet this water issued from rock or through hardpan soil. If the main head of spring is at one point we should here either insert a large drain tile, or if preferred, would enclose it with a stone or brick vat, using Portland cement. We should prefer the large tile, as then only cracks to stop up will be at bottom, which can be done with Portland cement, or clay rightly puddled will settle into cracks and stop leaks. It will be easy to drill a hole in the tile to pipe the water. If necessary a vat can be constructed near the spring to hold a larger amount, but we should prefer to draw direct from the spring. We should get a man who thoroughly understands his business to do the cement work; then a satisfactory and inexpensive job will result.

H. G. M.

Various Fruit Questions.

A. D., Friends, Pa.—I have a piece of Cuthbert raspberries set in May, 1901, that were pinched off at about 18 inches. They have thrown out from three to four laterals that in some places meet across the seven-foot rows. These laterals are quite close to the ground, many at the surface. Will they support themselves during Winter and fruiting next year, or would you advise wire or stake support for the plants? They did not send out but one or two canes until late in the season. Will these small canes be all right for setting next Spring? Would you advise plowing to the rows this Fall? They have had level culture, and the soil is well drained. My Miller raspberries set same time have not made one-third the growth of Cuthbert. They are affected somewhat with root galls. Are they a good variety to set in this latitude, 42 degrees north? How are the Loudon? Are the Miller and Loudon more subject to disease than the Cuthbert? What varieties of strawberries would you advise setting on black somewhat mucky ground? Jessie has made fine growth of plants this season, but I have not fruited them yet. Would you advise Clyde and Bubach for higher ground?

ANS.—Your raspberries are too young to bear much fruit. It would hardly be worth while to stake them this season, and they will not be likely to need it next year, unless you are willing to take the trouble chiefly for the sake of appearance. Trim the laterals back to two or three buds next Spring. The new canes may be allowed to grow about 30 inches high before pinching. They will probably be self-supporting if well pruned the following Spring for fruiting. Leave your rows level, plowing to the rows will do more harm than good by cutting roots. The Miller Red, where affected with root galls, should be dug and burned. This variety is useful on account of its early season and bright color, but it does not generally succeed as well as Cuthbert. The Loudon is later and rather dull in color, but is usually healthy and hardy. Gandy is considered the most profitable strawberry on heavy soil, though there are many local favorites. Clyde, Bubach, Warfield and William Belt are excellent for upland.

Nodules on Peas; Green Crops.

E. D. B., Cayuga, N. Y.—I enclose some roots of Canada field peas. You will see that they have small bunches attached to them. Are those bunches the tubercles that gather nitrogen from the air? I wrote you last Spring for best treatment of a piece of ground intended for strawberries next Spring, but at time of writing it was in rye. Your advice was to "cut the rye for hay if needed, plow the ground, drill in cow peas, cultivate long as possible to get between rows, and at last cultivation sow Crimson clover." I did not need the hay, so I plowed it under about the time the grain was forming. When going to our local seedsmen for the cow peas, they had all been sold; so I concluded to try the Canada field peas. I drilled them in, making the rows 28 inches apart; kept them well cultivated and at the last time over, sowed Dwarf Essex rape. I used rape instead of Crimson clover because I wished to plow the ground late in the Fall. The peas grew nicely until the latter part of August, when they began to turn brown; and upon examination the vines proved to be covered with green lice. The two days succeeding my discovery of the lice we had heavy rains lasting for several hours, and when the weather cleared up there were no green lice to be found; the peas, taking on new life, have grown nicely ever since. A week ago I broke a vine off at the ground and it measured 9½ feet in length. The rape is making a good showing, and with all that mass of green stuff it puzzles me to make out how to get it all plowed down, unless by going on with a Cutaway harrow and chopping it up. Within a few days the green lice have returned to the peas.

ANS.—The little "bunches" on the roots of the peas are the nodules or houses in which live the bacteria which secure the free nitrogen from the air. These "bunches" are found on the roots of the leguminous or pod-bearing plants. These tiny bacteria are living germs or low forms of life which do their work underground, and add greatly to our supplies of nitrogen. Whenever these nodules are present on the roots it is safe to conclude that the plant is obtaining nitrogen in this way. We have reports of green lice on field peas. The lice do not, we think, usually work on cow peas. The rape will keep green until the ground is fully frozen. Some plants usually live through the Winter. We would not Fall-plow this ground, but let the rape grow and rot—plowing all in the Spring. It is sometimes possible to chop up these heavy green crops by rolling and then working with disk or Cutaway across the track of the roller.

BULBS FOR FALL PLANTING Hyacinths, Tulips, Crocus, Narcissus, Lilies, etc. OUR NEW BULB CATALOGUE is sent free. It tells all about the best bulbs, also seasonable seeds and plants, including our celebrated grass mixtures for the lawn and pleasure ground. HENRY A. DREER, Philadelphia, Pa.

Springs and Forest Growth.

A. A. H., Vermont.—Are springs affected by the cutting off of wood and timber? The spring which supplies my buildings with water comes out of the foot of a mountain. The question I would like answered by experts is: Should I cut the timber near the base of this mountain and about the spring, would it decrease or in any way affect the supply of water? Do not the roots of large trees drink up as much moisture from the earth as the branches would hold? The trees are mostly large maples, hemlocks, etc., and the spring is a deep one, evidently. If I cut the wood off I should set the land again to an orchard.

The question as to the influence of forest cover on the flow of springs cannot readily be answered by a simple yes or no, for it depends upon a complexity of conditions and would, therefore, require a careful diagnosis of the conditions surrounding the spring, especially geological and topographical conditions. There are various kinds of springs, according to the character of the geological formation; some, like the so-called ground water or cavern spring, would not be to any particular extent influenced by the presence or removal of the protecting forest cover; others, namely surface springs, very quickly show a difference in flow, sometimes to the extent of wiping out the spring altogether; while with others, like the so-called fissure springs, it would depend whether the supply of water comes from a distance or from near the spring. In the latter case removal of the immediate shade of a forest cover may reduce the outflow. The roots of trees do not, as a rule, absorb as much water as the evaporation by the sun on an unprotected water-shed would. If, as the writer states, the spring is a deep one, the removal of the shade may not affect it much. B. E. FERNOW.

Ithaca, N. Y.

It is quite necessary that a person know something about the geological conditions in order to discuss this question satisfactorily. That the cutting off of woods does affect the flow of springs there is little question, generally speaking. While it is true that trees do act as pumps, and assist in giving off much water to the air through transpiration, they nevertheless shade the ground and retard much evaporation. The leaf mold and decaying organic matter found in woods act as reservoirs for springs. Under certain formations of soils, however, springs are entirely independent of forest growth. I am inclined to think that if all of the growth above the spring is cut off, and the land broken up and put into an orchard, the spring would feel the effect. The orchard cannot take the place of the forest for conserving moisture, and at the same time be a profitable orchard. If only a portion of the wooded growth is removed, and that near the spring, while plenty of growth remains on the mountain, it is believed that the spring will not be affected. I would, however, keep a small amount of shade just above the spring itself to lessen the evaporation, and keep the ground moist and cool.

Durham, N. H. FRANK WM. RANE.

It is not very likely that this spring is so local in character as to be appreciably affected by the removal of timber from any moderate area such as a farm immediately around the spring. Forests influence the capacity of springs and the drainage of water from a country chiefly by retaining the water which falls upon the ground in such a way that a larger per cent of it soaks into the ground so as to reach the source of springs, rather than to flow off quickly from the surface without penetrating the ground at all. This effect of forests is accomplished through the retardation of the flow over the surface due to the leaves, fallen branches, and forest mold, which absorb at once quickly and retain quite heavy rains, thus preventing them from flowing down slopes and giving them opportunity to soak into the ground. I should not, therefore, expect that the clearing up of 40 to 80 acres, or even 160, would seriously reduce the capacity of any deep-seated spring. If your correspondent's land covers the whole of a comparatively short steep slope, so that all of the water which contributes to the spring must fall upon his own land, then it is quite likely that the clearing of it and replanting to orchards might lessen the flow of his spring somewhat, unless he planted his orchard on contours, and controlled the drainage from the slope by means of contour ridges, so as effectually to prevent washing and gullying. But I should not expect a sufficient decrease to render the spring dry unless it is a very small spring. F. H. KING.

Madison, Wis.

EVERYBODY'S GARDEN.

EXTENSIVE VS. INTENSIVE CULTURE.—In these days of magnificent enterprises in farming and gardening, as illustrated on page 721, the small operator must needs pinch himself to determine whether he is really awake, or Rip Van Winkle-like, merely sleeping the hours away. To many of but little or even no means at all, the idea of launching out into the teeth of these vast undertakings with the hope of successfully stemming the tide, the outlook seems hopeless. If, however, it is remembered that broad acres and costly paraphernalia are not always the true index of real profits, the case may perchance take on a new aspect. I have no quarrel with the extensive operator, but nevertheless have the almost certain knowledge that there always has been and always will be plenty of room for the less pretentious, provided he is the really up-to-date and intensive man. It is all right and withal very instructive for the man of the long bank account and unlimited ready cash to set the big wheels in motion to tell us just how these great enterprises may be profitably operated. But if he can clearly show his less fortunate neighbors how to "make circumstances," and by his own unaided efforts to throw up a highway to success, he may perchance confer upon the world a far greater service. The vast majority have to begin the life battle empty handed, and hence, said vast majority are, at the start at least, compelled to face and solve the stern problem of making bricks without straw. None of us by any means holds the true key to the situation, for it must be filed and fitted to meet the varying circumstances and contingencies of the individual; but the faithful record of success, or even failure, is often helpful and encouraging. If, happily, I may assist some one in the solution of this great problem, it may be pardonable to make some extracts from the garden record of 1899, which was fortunate enough to win first prizes in the great international garden contest of that year. For this purpose the expenditures and receipts from three-fourths of an acre are tabulated. While space forbids the detail of the cultural methods, or the work performed in order from day to day, it may be well to explain that the ground, by force of circumstances, was cultivated in four separate plots, and the tables in the main are general results rather than itemized; also that whatever was consumed by the family or given away, or left on hand at the close of the contest, was estimated at the regular market prices:

PROFITS.

Rhubarb (dark forced)	$5.17
Radishes	.64
Lettuce	5.95
Tomato plants	13.50
Cabbage plants	3.00
Peas	1.20
Carrots	1.50
Cabbage	47.57
Sweet corn	7.77
Butter beans	1.80
Potatoes	8.25
Beets	2.85
Tomatoes	35.35
Sweet peas	10.50
Melons	6.55
Lima beans	4.05
Cornstalks	.75
Squashes	3.50
Parsnips	2.25
Sea kale	2.00
Mangels	6.22
Onions	.50
Total	$170.87

EXPENSES.

Rent of land	$3.60
Fertilizer	9.62
Labor	40.77
Seeds	4.75
Plants	8.10
Roots	1.00
Interest on capital invested at six per cent	7.90
Wear of garden tools at 1½ per cent.	1.77
Total	$77.51
Proceeds from garden	$170.87
Expense of garden	77.51
Profits	$93.36

IMPLEMENTS USED IN GARDEN.

Plow	$6.50
Planet Jr wheel hoe	6.00
" " hill and drill seeder	7.00
" " 12-tooth cultivator	8.00
Roller	3.50
Wheelbarrow	1.00
Spade	.75
Shovel	.60
Hoe	.40
Garden line	.15
Rake	.35
Sprayer	5.00
Horse and wagon	75.00
Hotbeds	10.40
350 flower pots	7.00
Total	$131.65

The tools above enumerated would have cultivated much more ground, and were but little worn, but reasonable allowance was made in interest on capital invested. At this rate, the profits per acre would be $124.48, which is a fair showing, but not at all out of the ordinary, as many of the gardens reported showed profits far and away above this. The prizes were not contingent upon the largest showing of profit, but accuracy of detail as to methods and results or "just what you did and how you did it."

SIDE LINES.—While the actual results clearly show that good profits are not always contingent upon large investments, it clearly shows that intensive culture will bring satisfactory results. While the large cash prizes must be considered purely as side lines, and by no means to be considered as certain quantities, they readily show the value of keeping the eyes open to the possibilities around us, and keeping them constantly set upon the highest possible mark. As before intimated in these columns, other possibilities, such as breeding up, highest excellence in products, catering for best customers, prizes at fairs, and a thousand and one other sources of profit, are all accessible to the small as well as the large operator. Then for us who must doubtless be numbered among the "small fry," there is much of encouragement. In fact, with eyes ever wide open to the possibilities around us, we need never have a fear to pull off our coats and knock the chip from the shoulder of the largest operator on earth. J. E. MORSE.

Do You Want a Shot Gun?

If you do you want a good one, but you need not pay fancy prices for it. There is none better made than the Stevens. No. 1 has top snap, low rebounding hammer, special "electro steel" choke bored for nitro powder, walnut stock, rubber butt plate case-hardened frame. Forearm attached to barrel, and fitted with metal joint. Price, $5.50, or with a year's subscription to THE R. N.-Y., $6.25. No. 2, in addition to No. 1, has automatic shell ejector, checked pistol grip and forearm. Price, $6.50, or with one year's subscription to THE R. N.-Y., $7.25. These guns are 12, 16 or 20-gage, 28, 30 and 32-inch barrel, and weigh about 6½ pounds. We will send No. 1 free for a club 10 new subscriptions; or No. 2 for a club of 12. No boy or man need be without a good shot gun, when he can get one on these terms. A few hours' time among his neighbors will do it.

THE RURAL NEW-YORKER, NEW YORK.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

ROSE CLOTHILDE SOUPERT.—There is a prediction in the late H. B. Ellwanger's charming book, "The Rose," made nearly 15 years ago, that Tea roses, growing in huge clusters, might come from the use of the many-flowered wild rose of Japan, Rosa multiflora, in breeding new varieties. A race of dainty small-flowered kinds, resulting from crosses of R. multiflora with various Tea and Noisette roses, had already been introduced under the name of Polyantha roses, but it remained for a French grower to produce in 1890 a rose fulfilling Mr. Ellwanger's prophecy, in an extraordinary manner. It was produced by hybridizing Mignonette, one of the popular Polyanthas, with a white Tea, and was introduced to the American trade by J. C. Vaughan, of Chicago, under the name of Clothilde Soupert. It is certain that no rose of greater value has ever been disseminated here. It is useful wherever roses may be grown, either for pot culture or bedding purposes. It is almost hardy in the latitude of New York, and can be grown farther north if protected from hard freezing and Winter sunlight. It is covered with large blossoms at all times when in growth, and has healthy, glossy foliage, seldom affected by any disease. Fig. 340, first page, shows a small cluster of blooms less than natural size, borne on a plant grown seven years in a six-inch pot. We have had a cluster of 15 blossoms open in good condition, though such large clusters usually fail to develop well unless judiciously thinned. After trials extending over 10 years, we value Clothilde Soupert so highly that we would retain it to the exclusion of all other varieties, if forced to content ourselves with one rose. While invaluable for the border or window garden, it is of no use to the grower of cut blooms, as only varieties bearing large individual blooms on long stems are wanted for that purpose. It is, however, the rose for the million, and is greatly appreciated by amateurs. It should be included in every order for plants by beginners in rose culture. Plants are very cheap, being offered at 10 to 15 cents each by growers. Plant out in an airy place, and fertilize with old manure, wood ashes, and, if possible, a little clayey loam burned until it is red in color. It should begin to bloom almost as soon as growth starts, and continue until freezing weather. Cut off the flowers as they fade, and occasionally prune or thin out any weak branches. When the ground begins to freeze the plant may be lightly covered with coarse straw or reeds, and later with evergreen boughs, where procurable, or it may be potted up for a sunny window. Where the climate is too severe for safety outdoors, the rose may be lifted and planted in a box of earth, with a few holes in the bottom for drainage. The box may be kept in a spare room, where moderate freezing will do no harm, if it is not warm enough to start growth during the intervals. The soil should be kept quite moist, and the endeavor made to have the plant dormant during cold weather. Many hard-wooded plants of doubtful hardiness may be wintered in this manner. Nothing has appeared likely to succeed Clothilde Soupert in its way, though innumerable attempts have been made to develop varieties having more substance to the petals and of other colors. Probably the nearest competitor is Mosella, sometimes called the Yellow Soupert. It had a yellow Tea or Noisette for one parent, and a Polyantha for the other. The flowers are a pretty light yellow in bud, but turn white when opened. They are freely produced in clusters when the plant is in full growth, but there are frequent intervals when it is "off crop." Pink Soupert, produced by crossing Clothilde Soupert with Lucullus, a dark red Bourbon rose, is very pretty, and a free and constant bloomer. The three varieties mentioned make good companions in the garden, as they are about equal in stature and hardiness, but the delicate blush and white Clothilde Soupert will always be most admired.

KIEFFER AND LE CONTE PEARS.—The season has been very unfavorable for pears about the Rural Grounds, and the crop of all varieties is very light, though the Sand pear hybrids, Kieffer and Le Conte, have done vastly better than the standard varieties. They endured the trying conditions of excessive moisture and heat through the growing season with no perceptible damage to the foliage, though continuous rains at blooming time caused the set of fruit to be very scattering. Many thousands of barrels of Kieffers will be shipped from near this locality as soon as matured sufficiently for market. A few orchards are fairly well loaded, while others, apparently as well cared for, have barely a show of fruit. The prices, in sympathy with the scarcity of all pome fruits, are quite satisfactory to those who have the pears to sell. Windfalls have been bringing $1 to $1.25, and good hand-picked $1.75 to $2.25 per barrel. Inquiry develops that most of these Kieffers are used for canning and culinary purposes, and they are not offered so freely as in the past on the fruit stands. Growers are learning better how to handle and ripen them up in an attractive manner. The Le Conte was planted quite freely about here eight or 10 years ago for family use, but, luckily, did not find its way into many commercial orchards. It is a handsome grower, like Kieffer, but more spreading in habit, with even more lustrous foliage. The pears ripen in October, and at once begin to decay about the core. The variety is usually promptly condemned on this account as soon as it comes into bearing, but if the fruits are picked as soon as the seeds color, and kept in a close place for two or three weeks, they color waxy yellow and develop a pleasant sub-acid, but not high flavor, with scarcely any loss from rot. They are excellent for stewing and other kitchen uses just before they soften. When one learns to handle the Le Conte properly, it is found to be a useful home variety, coming in when other pears are not available. Kieffer is supposed to be the result of the action of Bartlett pollen on the Chinese pear, though Downing gave the pollen parent as Anjou. The pollen parent of Le Conte does not seem to be known, but it has been much grown through the South for nearly 40 years. Our trees of Kieffer and Le Conte commenced to bear three years after planting, and by means of careful thinning and early picking, we get some very acceptable fruits while waiting for better varieties to come on.

PLANTING GARDEN LILIES.—The long list of lilies offered in bulb catalagues is very tempting, but disappointment usually follows the planting of any considerable number of varieties. Lily bulbs lose much vitality during shipment and storage, and only a few kinds are likely to reward us with a healthy growth. The list of really reliable varieties is very short, running about as follows: Lilium tigrinum splendens, L. lancifolium rubrum and album, and varieties of L. elegans. Where white lilies are wanted, L. candidum and L. longiflorum may be planted with reasonable hope of success. The magnificent L. auratum, the Golden-rayed lily of Japan, is very uncertain, most of the bulbs decaying after giving a few poor blossoms; but it may be planted with the hope of securing a chance specimen vigorous enough to establish itself. Lilies, as a rule, are unfavorably affected by crude fertilizers, and do not seem to require nitrogenous materials, except during the period of bud development. They are best planted six or seven inches deep in good unmanured soil in a well-drained place. If they can receive a little shade at midday success is more certain. Each bulb should be bedded in and surrounded with two or three inches of clean sand, to check the inroads of fungus myceliums. The covering should be of sand or light soil, easily penetrated by young shoots in Spring. A light covering of leaves, held down by a few boughs, is all the protection needed to winter the varieties named. Lilies look best in irregular groups, with the plants standing about a foot apart. If a fair growth results, the bed may be mulched with old manure as soon as the buds can be seen, which will greatly aid the development of the blooms, but in the long run the less manure used the more permanent the results are likely to be. Some L. lancifolium bulbs, planted seven years ago in sod, under an apple tree, without culture or fertilization of any kind, have developed in a splendid specimen clump, growing in beauty each year, while a similar planting in a well-fertilized rose bed has diminished in strength about to the vanishing point. The apple tree is an old one, headed so high that sunlight reaches the lilies freely. Lilies seem to like the protection and drainage afforded by tree and shrub roots, but they also appreciate free air and light, and should not be planted in close shade.

W. V. F.

A Blow at Quack Grass.

Three acres of peach orchard had been abandoned for a couple of years—not cultivated—and had become thickly set with Quack grass. In August of last year, after the trees had been cleared off, the Quack stood about as thick and tall as a first-rate crop of Timothy, and it was the only Quack grass of any amount on the farm. How it got there and infested the soil so completely in the time it did is a puzzle. We plowed it in August, and harrowed the field five or six times before Winter. It was then pretty clean, but last Spring the Quack sprung up as thick as new seeding, and shortly the field was green as ever with it. About June 10 last we plowed it 10 inches deep, cultivated thoroughly, and planted potatoes and cabbage. Good cultivating and hoeing was the rest of the treatment. The Quack is knocked out. Two acres of the potatoes will yield 180 to 200 bushels per acre; and the acre of cabbage 12 to 15 tons. Land always grows fertile under Quack grass.

G. F. W.

Can You

do a little pleasant and profitable work for us in your own town? No experience necessary. We will explain just what you have to do. The work will be light, and we will arrange for the time you shall be able to give to it. We can give you work for all your time or just for your spare time. Write for full particulars. THE RURAL NEW-YORKER, NEW YORK.

AN ACRE OF CORN

and its possibilities under the Silage system—being the theme of

"A BOOK ON SILAGE"

By Prof. F. W. WOLL

of the University of Wisconsin. Revised and up-to-date, neatly bound into a volume of 234 pages. It embraces full information from planting to feeding the crop, and includes working plans and specifications for building all silos. Also embraces:

I—Silage Crops. II—Silos.
III—Silage. IV—Feeding of Silage.
V—Comparison of Silage and other Feeds.
VI—The Silo in Modern Agriculture,

And illustrations and complete plans for round and rectangular silos, dairy barns, tables of compounded rations, etc. Mailed for 10c. coin or stamps.

SILVER MFG. CO.

How to Drain Land Profitably.

On every farm there is probably some land that could be made more productive by underdrainage. Properly drained land can always be worked earlier, and more profitably. The best and most economical way to drain is explained in the book, "Benefits of Drainage and How to Drain," which is sent *free* by JOHN H. JACKSON, 76 Third Avenue, Albany, N. Y.

ROUND TILE

Cyanide

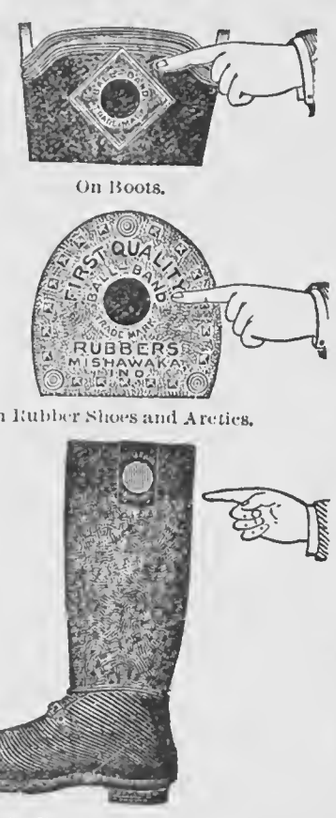
Guaranteed 98 to 99 per cent., for generating

Hydrocyanic Acid Gas

the most effective fumigating material, to destroy scale insects on fruit trees and plants. The only positive eradicator of the dreaded **San Jose Scale.** Endorsed by all Agricultural Experiment Stations. "A perfect practical remedy," says Prof. W. G. Johnson, State Etymologist of Maryland.

MANUFACTURED BY
The Roessler & Hasslacher Chemical Co.,
No. 100 William Street, New York.

A Small Red Ball on a Rubber Boot



On Boots.

On Rubber Shoes and Arctics.

On Knit Boots.

The small red ball on "Ball-Band" goods is something more than part of a trade mark—it stands in the realm of rubber as the sign of the highest standard attained in the manufacture of wool or rubber footwear. It stands for quality, honesty in methods—reliability all through.

When you buy rubber boots, shoes, arctics, knit boots and socks with the *Red Ball* in the trade mark, it means you can rely on them with absolute certainty to wear longer than rubber or knit boots of any other make.

"Ball-Band" Boots

are *not* made by the trust. They are made by the largest independent makers of rubbers in the world. The "Ball-Band" boots have earned their fame through superior wearing qualities. They have attained and maintained the highest standard of excellence known in the making of rubbers.

Insist on getting the kind with the Red Ball in the trade mark. Get them from your local dealer.

MISHAWAKA WOOLEN MFG. CO., Mishawaka, Ind.

HOPE FARM NOTES

LOOK OUT FOR LOCUSTS.—I have the following letter from Paterson, N. J.:

I see it reported that the 17-year locusts are coming next year. I intended to plant 500 pear and apple trees this Fall, but after reading about them I desired to get your advice first. I saw an article in THE R. N.-Y. of October 12, from a district where the locusts were last about four years ago. It is about seven years since they were in this section, and at that time they did considerable damage to young trees. Don't they show up all over the country at the same time? Is there anything to keep them off young trees, or do you think it better to wait and plant them next Fall?
W. G. B.

What our friend saw was a warning by Prof. J. B. Smith, of the New Jersey Experiment Station. These locusts are due next year. They spend 17 years in the ground, and then crawl out and lay their eggs. The little ones, when hatched, crawl into the ground and remain 17 years more before coming out. In 1885 these locusts came in great numbers over the northern part of New Jersey, and did great damage. This is only one brood. There are at least 22 different broods in the country, each occupying a certain tract of land, and sure to appear every 17 years. In the South the locust remains 13 years in the ground instead of 17. We are therefore reasonably sure to see these creatures next year. We may expect them in enormous numbers during the last of May or early in June. They will be with us about a month, though they will wear out their welcome in 24 hours. There is no way of fighting them with poisons.

WHAT ABOUT IT?—These locusts appear to have no ill-feeling against humanity. Like the poor fellow in Bleak House, they don't "go for to do it," but they get in their work all the same. Like many a human blunderbuss they do damage without meaning to. They cut slits in the twigs and small branches of trees in which their eggs are laid. When they are numerous they cut so many of these slits that the tree may be killed, or twisted and warped all out of shape. That is why Prof. Smith advises farmers in our part of New Jersey not to set any fruit trees this Fall or next Spring, because these tender little trees will be just the sort of incubator and baby carriage that the locusts will pick out. The older trees will be able to provide a cradle for the young locusts and still have energy enough to attend to their own business. Growing grafts or buds are said to be favorite resorts for the locusts. The danger is a real one, I am sure, and it is well to be warned in time.

TAKE A RISK.—In the face of this warning shall we plant trees next Spring? I had planned to plant a good many, but there is surely a big risk about it. I shall certainly not plant any very small trees. No June-budded peach trees for a locust year! I shall get the largest trees I can afford, and not prune them close. The idea is to leave as much wood as possible on the tree, so that even if the locusts are numerous there will be a chance to save some good shoots. I had intended to do a good deal of pruning this Winter, but shall now give it up until after I see how many locusts we are expected to provide for at Hope Farm. I do not understand that they fly far. I think there will be localities right in the track of the last brood where there will be but few locusts. It is said that the sparrows hate these locusts as they do few other insects. They tear the locusts in pieces in the most savage manner, and kill thousands of them. The sparrows will be worth their weight in gold next year, and if you see a boy killing them it is your duty as a fruit grower to spank him then and there. I expect to plant some large trees, for I do not like to change the plans we have made. At the same time I know that it will be a risk, and that it will be my own fault if the locusts ruin the trees.

FARM NOTES.—We have learned to respect the roller this Fall. Much of the land where we have sown rye and wheat was quite rough. Charlie spent one whole day harrowing two acres, and still there were little ridges. After sowing the grain the roller was put on and it packed and smoothed the ground, making a far better seed bed than could have been possible without it. I see many fields of wheat and rye covered with big clods which the harrow did not break. The roller would have crushed and fined them, and added 20 per cent to the stand of grain. A tiny grain plant will grow weary of trying to crawl around and under one of these big lumps, and will simply quit trying and die. . . . Husking has begun, and the corn is turning out well. We hope to get our stalks mostly under cover before another long rain. The hay mows will be filled and also a big barrack back of the barn. The first shredding will be done as soon as our sowed fodder is all eaten. The horses have no hay now. . . .The plan of throwing ears of corn to a horse is seldom satisfactory unless the feeder is able to reduce the ear to pounds. We find that 10 pounds of our ear corn shells out on the average about seven pounds of grain. Later, when the cob is further dried out, the proportion of grain will be higher. While plowing lasts we aim to feed a work horse about eight pounds of corn and four pounds of bran per day. . . . The tender stalks of the sowed corn make good horse feed, and you can grow a heavy weight on an acre. Still, I shall not *sow* any more corn. It pays better to drill it and give fair cultivation What we want to get into our stock food is sunshine, not shade. Sunshine is force, and unless the fodder has it while growing, you will need a whip to get force out of your animals. . . . The mixture of Cow-horn turnips and Crimson clover has made such a strong growth that I am now sorry that we did not seed this mixture in all of the cornfields. It makes a fellow inclined to kick himself for his obstinacy in not having faith when he sees what might have been done for that cornfield.

STRANGE THINGS.—An old pear tree near the woodshed had two branches in full bloom on October 28. The tree gave a fair crop of fruit, which ripened in August. Then the web-worms got at the tree and nearly stripped it. After that these branches put out new foliage and bloom. There are scattered blooms on other parts of this tree, but I have not been able to find another bloom in the entire orchard. I shall expect next to see old Major start into a sudden burst of speed without any urging, and while headed from home, or Grandmother show us how to dance, or the old buggy carry us over the hills without sounding an alarm like a watchman's rattle. . . Another mystery is the reason for our potato failure. I am quite unable to account for it, for as a matter of experiment we tried seed of the same variety from Maine, from New York, and also from New Jersey and Florida. We also planted on high ground and low ground, sod and cornstubble, and used both fertilizer and manure. Our best returns were on low ground with manure, but even these were barely worth digging. Yet, after all, I believe we have the best crop of any farmer in our neighborhood—so general has been the failure. . . . Who can explain how a boy is able to turn work into play? The Orchard grass in the barn orchard grew so tall after the second cutting that we turned the cows in for a few hours each day to nibble it down. Orchard grass will stand this sort of pasturing better than any other hay grass that I know of. At one end of the orchard is a newly seeded piece. Julia and Blossom persisted in tramping over this, one because she is a natural kicker, and the other because she is hunting for her calf. To keep them off this seeding we put the little boys on guard. Had they been simply ordered to watch the cows this would have been hard work. I told them to play that the cows were buffaloes and that they were Indians. When the buffaloes came to the line they were to ride their ponies out and drive them back. They got some hen's feathers and stuck them in their caps, ran muscle into their little legs and had a glorious time. What a world this would be if grown up men could inoculate their daily toil with play like that!

STOCK NOTES.—Blossom is developing into a fine young cow. She has milked the theory all out of my prediction as to how her thick neck and fat ribs would empty the pail. Her big neck, those fine potato tops, and the appearance of some of my old apple trees have been so discounted by the actual results that I don't care to do any more judging by the eye alone. . . . Blossom's mother, old Jersey, is still on hand, and will end her days at Hope Farm. Her milk is a little short now, and we shall give her a long vacation. I saw the old cow the other day with her neck stretched out while Blossom was licking the old lady. How the old girl did enjoy that sandpapering. I am no mind reader, but it was easy to imagine Blossom saying to her mother: "Now, Mother, I want you to rest. I am young and strong, and I can fill the pail. You have done more than your share. You are old and tired. Stop working so hard. Take a good long vacation and leave things to me!"

"What nonsense to talk that way about a cow," some of our practical folks will say. Very well, drop the cow part of it if you like. Isn't that the way a dutiful daughter ought to talk to her mother? Would it hurt a son to give voice to the same idea? . . . Several weeks ago I spoke of two little pigs. They are own sisters, and at that time had had the same food and care. One weighed 42 pounds and the other 19. Since then the larger one has run in a field with just enough food to keep her growing thriftily, as we intend her for a brood sow. The other has been kept in a small pen and stuffed with food to see if we can feed the runt out of her. On October 26 the larger one weighed 62 and the little one 33½ pounds. No use talking, runts will be runts. The poorer the breeding the larger the per cent of runts.

ALL SORTS.—The pullets are going into Winter quarters in good condition. They have been well fed and warmly housed. For the first time in several years we have been able to keep the poultry well yarded. Not over half a dozen have been able to get over or through the fence. As the cool nights come on these few outsiders fly into the trees for roosting. This seems to be a habit which the unconfined fowls cannot shake off. Though housed for a hundred generations the hen follows her remote ancestor into a tree whenever she can. . . . We had an object lesson in the power of a hen's leg when we opened the garden door. This garden is the hens' Winter playground. In early April we turn them out, plow, smooth and sow garden seeds. Late in September we turn the hens back. By this time little is left on the ground but weeds. The corn and Lima beans are beyond the reach of the hens, and the low-growing vegetables have been picked. This year the garden was weedy, but in two weeks the hens had it scratched and cleaned from corner to corner. Weeds and all had disappeared. It seemed impossible that the small hen's claws had rooted out such a mass of vegetation, yet it had been done. . . . One of the interesting things this Fall is the way the Japan plum trees are holding their leaves. The pear trees are mostly bare, and the Greening apple trees have nearly shed their coats, but the plums and the Baldwin apple trees have a grip like iron, and refuse to take leave of their leaves. . . . . There have been too many augur holes in the floor behind the cattle and under the horses. These holes do not augur well for the size of the next crop. We plug them up and use old sawdust freely under the stock. The solid value of the manure is in the liquids. . . On October 28 the nasturtiums were killed by frost. The Cannas look sad around the edges of the leaves, but are not yet dead, and the sweet corn at the top of the hill has not yet soured on the world.

H. W. C.

For the land's sake, use Bowker's Fertilizers. They enrich the earth.—*Adv.*

BEFORE BUYING A NEW HARNESS write for our 200 Page Illustrated Catalogue giving full description and prices of all kinds of single and double harness and save 25 per cent.
King Harness Co. 510 **Church St., Owego, N.Y.**

RIPPLEY'S COOKERS.
Sell from $5.00 to $45.00. Made of boiler steel. No flues to rust or leak. Can't blow up. Guaranteed to cook 25 bu. feed in 2 hours, and to heat water in stock tanks 200 feet away. Will heat dairy rooms. Catalogue and prices mailed free.

SUBSCRIPTION: ONE DOLLAR A YEAR.

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs.

"A SQUARE DEAL."

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

Name and address of sender, and what the remittance is for, should appear in every letter.
Remittances may be made in money order, express order, personal check or bank draft.
THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, NOVEMBER 9, 1901.

10 Weeks for 10 Cents.

WE are asking every reader to interest himself in this proposition. We want THE R. N.-Y. to visit 20,000 new homes by New Years on this proposition. If every subscriber sent just one new name we would more than double that number of homes. Cannot you who are now reading these lines get just one farmer of your acquaintance to give you 10 cents for 10 copies of THE R. N.-Y.? We keep mentioning it because we want you to have it in mind when you meet your farmer friends.

*

WE find that the "Chemicals and Clover" system of farming appeals to many of our readers. We refer to the plan of maintaining the fertility of the land by means of green manures, or the roots and stubble of hay and grain, with chemical fertilizers. Will those who have followed this plan of farming without stable manure tell us about it? We know that the plan is practical under many conditions. We need reports of wide and varied experience to determine just what those conditions are.

*

FARMERS are apt to forget—if they ever knew—that there is a seed laboratory in connection with the National Department of Agriculture, where seeds will be tested free of charge. If you send on a sample of seeds the experts will tell you what proportion of them will grow and how badly they are mixed with weed seeds and trash. Such a laboratory ought to be very useful to farmers who buy seeds, but thus far the seedsmen have received most of the benefit, because the farmers have not asked for help. This laboratory ought to help buyer as well as seller, and it will just as soon as the buyers ask for the service. You should write to A. J. Pieters, Office of Botanist, Department of Agriculture, Washington, D. C.

*

A STORY going the rounds of the press is how the President of Mexico killed a trust or injurious trade combination. It is said that the Mexican corn crop was short, and that certain dealers undertook to corner the crop, and thus force the people to pay exorbitant prices. The President saw through the game, and at once proceeded to have the high Mexican tariff on corn removed. This being done, a flood of American corn was imported, prices dropped to a natural figure, and the gamblers presented a gamboling ground for the lambs they had expected to shear. We are not familiar with the Mexican tariff laws and do not know what power the President of that Republic has to change them at will. This would be dangerous power to place in the hands of most men. In France, we understand, most tariffs are arranged upon a sliding scale. If the French wheat crop is heavy it is made easy for the authorities to increase the tariff and thus maintain prices. Should the crop be light it is just as easy to reduce the tariff, increase imports and thus equalize prices. In theory this would seem a desirable arrangement, and it points to one way of overcoming the evils of the trusts which destroy home competition. We have felt that one great trouble with our American tariff laws is the fact that any change in them requires a long and bitter political fight. It is now reported that President Roosevelt favors a tariff commission. As we understand it, this means a strong non-partisan body of men who may hear evidence and make such changes in the tariff as seem best for all classes. The details of the plan are not yet clear, but as a general proposition we think such an arrangement would be much better than the present system.

THE Supreme Court of New York State has decided that it is against the law to put so-called "preservatives" in milk. The question considered was whether a law prohibiting the use of these drugs was constitutional. Such a law was passed, and the Agricultural Department undertook to enforce it. A clear case was made against a milk dealer, but the court decided against the Department on the ground that the law was unconstitutional. The Supreme Court now declares that the law is sound. It would be indeed surprising if the use of drugs which undermine the human constitution is to be permitted on constitutional grounds!

*

LAST week an Ohio man gave his experience with cow peas. At first the crop seemed disappointing, as the farmer expected it to pay him in seed. Finally the vines were raked up to be burned, which would have been the most wasteful use that could be made of them! Then they were hauled to the barnyard to be tramped in with the manure, but the cattle and hogs began to eat them! This is not the first time that the cow and the hog have taught the farmer a new wrinkle in his business. If they could only talk they would say about thus: "Why do you go to all this trouble of cutting, raking and hauling these vines? If you think you must have them eaten up why not let us do it for you? Pick what seed you want and then turn us into the field. We will cut and carry and turn these vines into meat and milk while you are doing something else—and what a polish we will put on the crops that follow!" It is a pity, isn't it, that some of our dumb brutes cannot talk so that all can understand them?

*

THE viscogen treatment devised by Dr. Babcock to thicken Pasteurized cream was intended to aid the labors of the cook or housekeeper. As he says on page 754, Pasteurized cream is thinner than natural cream, because the fat globules are uniformly distributed, instead of being grouped in masses. Viscogen restores this grouping; it is quite harmless, and there is no reason against its use, so long as the wishes of the consumer are consulted. But now we are told that this innocent cream stiffener is being used to give fictitious richness to attenuated milk, in an effort to make it appear the thing that it is not. It seems that a parallel may be drawn between stiffened cream, that is cream, and honest Winter butter to which a little coloring is added, as compared with watered milk thickened with viscogen and hog or steer fat tinted to look like June butter. The fraud consists, not in the stiffening or coloring, but in the cheap or adulterated substance which masquerades as something different and better.

*

THE writer once made the statement before the Connecticut State Grange that but for the New England water powers and the Yankee's love for his home the greater part of the New England hills would have remained a cow pasture. The veteran T. S. Gold replied that even had this happened New England would still remain a prosperous country. He was right. The figures of the last census make a remarkable story. We look upon Arizona as wonderfully rich in live stock—yet compare these figures:

	Total value of live stock.	Value of one year's product.
Arizona	$15,458,717	$4,522,801
Connecticut	10,932,212	11,651,359

While Arizona stockmen keep $15,000,000 worth of stock to produce $4,500,000 worth of meat, butter and milk, those Yankee farmers get a yearly income of $11,000,000 from $10,000,000 worth of stock! That is one advantage of living close to good markets. There are thousands of acres still left in New England, well suited to dairying and sheep breeding. They are also suited to the production of fine apples. The hill farms will yet be redeemed, and become literally a land flowing with milk and fruit.

*

AN illustration of the slow growth of prohibition sentiment or the effort to stop an objectionable practice is seen in the public signs against spitting on the floor in public places. During the past 10 years we have observed the following development of such notices in ferryboats and street cars:

1. Please do not spit on the floor!
2. No gentleman will spit on the floor.
3. Spitting on the floor not allowed.
4. Spitting on the floor is a misdemeanor, $500 fine or imprisonment for one year or both may be the punishment therefor.

Here we have the story of a slow growth which kept pace with public sentiment and education. For many years the scientists and physicians have known that probably the greatest source of infection for tuberculosis comes from the habit of spitting in public. They started the crusade against the habit, but the public seemed to consider it an infringement of "personal liberty." Hence the first notices included the word "please." Slowly the people are learning the truth about the cause and spread of consumption. As they understand the danger the authorities are able to use stronger and stronger regulations against it. In a few years they can substitute "will" for "may" in the last notice! Reforms grow in about that way. They must be backed by public sentiment before they can be enforced. That is all the more reason why some one should keep pounding away at unpopular necessities.

*

WE do not care to talk much about what we are going to do, for, in journalism, nothing is really done until it is printed and digested. Among other things in hand, however, are the following:

BARN BUILDING, by H. E. Cook. The barn is the dairyman's factory, and Mr. Cook knows what is needed.

REFITTING THE OLD ORCHARD. Prof. F. W. Card. Prof. Card will give among his "Nature Study" articles some valuable hints on the old orchard tree.

TESTING GRASS SEEDS. Prof. A. J. Pieters. Prof. Pieters has charge of the Government seed laboratory at Washington.

THE MODEL DAIRY TEST, by E. Van Alstyne. Mr. Van Alstyne had charge of the cows during the great test at Buffalo. He will tell us some of the odd and striking things which were observed.

It is our business to crowd into every issue of THE R. N.-Y. all the sense, science and sunshine we can. That is our business, and we are not hunting for an easy job.

*

IN a city like New York, where there are savings banks which are firmly founded, and have been in business for a long time, people have little difficulty in disposing of their savings. They use these banks with confidence, and scarcely give the matter a thought. Throughout the country districts, however, the conditions are different, and there are large sections either with no savings banks or with those whose records do not tend to give depositors confidence. That it is not safe to keep large sums of money in farmhouses is evident from the number of murders that have resulted from an attempt to protect property from robbers. The Government might relieve this condition by receiving money on deposit. The postal savings bank system has worked successfully in other countries, and some such arrangement would be welcomed by many. Cases have been known in which people have invested their savings in money orders payable to themselves, being willing to pay the extra fee and do without interest in order to feel that their money was safe in these Government checks.

*

BREVITIES.

BRED and meat—the purebred steer.

Go slow on experiments if your money is tied fast.

THE man who will not be sobered by responsibility is a dangerous citizen.

READ the articles on cow peas—all ye that have lean land to fatten at a low figure.

CANNING dry fodder in the silo, page 754. Who has followed this plan year after year?

IT'S harder than pulling teeth to find out the weak points of the things we want to buy.

IN hunting for suitable varieties of fruit we would always seek the advice of the best local growers.

"THE thorough head
That thoroughbred
And thoroughfed."

SKIM-milk paint may be made with sweet or sour milk, or buttermilk. Use one-half pound water lime to a pound of milk.

BE sure to keep windows and doors where apples are kept well screened. Thus Codling moths hatched in the cellar cannot escape.

IN 1900 there were 1,073,026 hens, 7,717 turkeys and 14,100 ducks in Connecticut. The year's income from eggs was $1,523,319, and from poultry $984,207.

PROF. PLUMB does not like shredded fodder for sheep as well as for cattle and horses. The sheep's mouth is pretty small for the work of grinding stalks.

OF course we do not pretend that the commission men on page 761 settle the Kieffer pear business for good. If others think differently we want to hear from them.

CAN any farmer "have cake and eat it, too?" One of the nearest things to it is to sow cow peas early, cut the vines for hay before "dog days," and let the second growth stay until frost for green manure.

A REFORMED dyspeptic says he cured his ailment, after all other specifics failed, by taking small doses of fine dry sand. This recalls the statement of one sufferer who asserted that the only cure for hay fever is six feet of gravel.

THESE scientific men have proved that mosquitoes carry malaria and yellow fever. As one result of this knowledge a New York man has brought suit against his neighbor to recover damages for "discomfort" resulting from mosquitoes bred in a pond!

Events of the Week

DOMESTIC.—The big packing houses of the G. H. Hammond Co., at Hammond, Ind., were destroyed by fire October 23, the damage reaching $400,000. The Hammond plant covers 15 acres, and 1,800 men are employed in the cooling department. . . . . A fire which started in a furniture warehouse in Philadelphia October 25, caused, within a short time, the death of 21 persons, and a property loss of $1,100,000. The entire building in which the fire started was aflame from top to bottom in a few minutes, and the victims were burned in full view of helpless spectators. . . . . An explosion of gas in a coal mine at Wilkesbarre, Pa., October 26, killed five men and injured 10 others. . . . . The locomotive of a freight train on the Wabash Railroad exploded October 25, near Boody, Ill., killing a fireman and brakeman. The engine and six cars were destroyed, and 150 feet of track torn up. The wooden leg of a tramp was blown off, but he escaped injury. . . . . Disastrous prairie fires have been raging in the northwestern part of North Dakota, and thousands of dollars' worth of range hay have been destroyed. . . . . A sawmill fire at Davenport, Iowa, October 25, caused a loss of $110,000. . . . . A fire at Delmar, Del., October 26, rendered hundreds of people homeless, and caused property loss amounting to $160,000. . . . . Warrants were issued, October 28, for members of the firm of J. M. Fisher & Co., brokers, Boston, Mass., on the charge of using the United States mails in a scheme to defraud. It is alleged that $1,000,000 has been taken from the public since January 1, 1900. People all over the country were written to and told what excellent chances there were to invest money, and that large returns could be expected. Pools were formed, and those desirous of getting rich quickly were invited to remit. After two or three weeks investors would be advised that a pool had been formed on some well-known stock, and that as the quotations had gone down the margins had been swept in, and that more money was necessary immediately in order to save the stock. . . . . October 28, reports were received at New Orleans of a terrible race war at Balltown, La., on the Mississippi border. Nine negroes and one white man were killed. . . . . The assassin of the late President was executed at Auburn Prison October 29, and his body interred in the prison cemetery, his relatives renouncing all claims to the remains. . . . . A railroad wreck near Lexington, N. C., October 29, killed 110 horses belonging to Buffalo Bill's Wild West show, and caused a loss estimated at $60,000. . . . . During the year's fishing season, just over, the town of Gloucester, Mass., lost nine ships and 62 men killed or drowned, leaving 17 widows and 35 orphans. The tonnage loss was $67,000.

ADMINISTRATION.—Great corporations in the United States are evincing a deep interest in the attitude of President Roosevelt on the trust question, and the recommendations thereon which he will submit to Congress in his annual message. Of late many prominent trust representatives have come to Washington for the purpose of ascertaining the President's views with respect to combinations of capital. . . . . The President has decided to hold no public receptions during the Winter. While he will, of course, receive visitors, and is doing so daily, his official family do not propose that he shall be placed in a position where he will be an easy mark for any evil-disposed person. The public will, therefore, be barred from the New Year's reception, as well as from the other official functions to be given during the Winter. The President's decision is thoroughly approved by officials and residents of Washington. At the New Year's reception, the persons who follow after the army and navy do not form a representative gathering. In fact, it is the strongest who are able to stand in line several hours before entering the White House who usually have the opportunity to shake the President's hand.

PHILIPPINES.—There are 2,600 troops in the Island of Samar. General Chaffee does not anticipate any further disasters. The garrisons, he says, have been increased, and every precaution has been taken to prevent another surprise like the one at Balangiga, which was unfortunate not only in the loss of the men, but in the effect it will have on other parts of the archipelago. Agitators have been endeavoring to inflame many communities by giving glowing accounts of the occurrences in Samar. The Central Filipino Committee has issued a proclamation confirming Malvar as the successor of Aguinaldo. . . . . Admiral Rodgers has notified troops at the ports to be on their guard, owing to the massacre of troops of the Ninth at Balangiga. At Pambujan, Island of Samar, all of the buildings in the vicinity of the barracks were immediately razed. General Smith, on his arrival at Calbayog, Island of Samar, sent reënforcements to Weyler. They found the garrison, numbering 15 men, besieged by over 100 bolomen. . . . . The constabulary report a fight with insurgents near Passi, Island of Panay, in which 25 insurgents were killed and three captured, together with a quantity of arms and ammunition. The news from General Hughes regarding conditions in the Island of Cebu is encouraging. Lorega has surrendered with his entire force, and one cannon and seven rifles, while General Hughes is negotiating for the surrender of Maxilot, who styles himself "Governor Political-Militar." His surrender will mean the pacification of the Province of Iloilo. . . . . Lack of food and the harassing effects of the aggressive tactics now pursued by the American forces are having their influence upon the natives. In many places where rice is doled out by the Government only enough is given for one meal, so that it is hardly possible for any large quantity to find its way to the insurgents. It is believed that the recent manifestations in the Island of Samar were chiefly due to the lack of food, the insurgents finding it necessary to make outlets to the coast in order to obtain this. . . . . The first labor problem growing out of the new tariff has arisen. A hat and umbrella factory, employing 600 hands, has found it necessary to close. The lawyers are making a protest to the Civil Commission, urging protection, as the same goods from Germany can be sold at half the price it takes to manufacture them here.

GENERAL FOREIGN NEWS.—The difficulty between the German and Venezuelan governments, arising from the fracas between the German sailors of the cruiser Vineta and the police of Puerto Cabello, has been settled satisfactorily. . . . . The American representatives at Constantinople and Sofia are said to be in communication with the bandits who are holding Miss Stone a prisoner, but the information from the outlaws' headquarters is said to be unsatisfactory. Rumors continue in circulation at Sofia that Miss Stone is dead.

FARM AND GARDEN.—The Missouri State Veterinary Medical Association met at Kansas City, Mo., October 22-24.

Atlanta, Ga., had a live stock show October 14-24.

The American Short-horn Breeders' Association held an exhibit at Kansas City, Mo., October 16-25, and will exhibit at Chicago December 2-7; secretary, John W. Groves, Springfield, Ill.

The Illinois Horse Breeders' Association will meet at Champaign November 18-21; secretary, Geo. Williams, Athens, Ill.

The Illinois Pure Food Commission is investigating the sale of horseflesh as beef in Chicago. They believe that an extensive trade is going on in this line, most of the horse meat going to cheap restaurants and saloons. Animals too old or diseased to work are killed for this purpose, and the authorities regard the trade as a menace to public health.

The next annual meeting of the Wisconsin State Cranberry Growers' Association will be held at Grand Rapids, Wis., January 14, 1902.

Extensive importations of cattle from the drought-stricken districts of Kansas, Missouri and Nebraska are to be made by farmers of Whitman County, Wash., a number of whom went to Kansas City to buy several trainloads. Wheat and corn are cheap in eastern Washington, and as cattle can be bought low farmers see opportunity of making large profits. Late in the Summer James Woodly, of Colfax, shipped out a trainload of young steers from Kansas City. These are now getting fat on his ranch. This experiment was so successful that other farmers are following his example.

The second annual meeting of the Blue Andalusian Club will be held in Mechanics' Building, Boston, Mass., January 15, 1902; secretary, Robert W. Lovett, 234 Marlborough Street, Boston, Mass.

The National Live Stock Association will hold its annual meeting in Chicago December 3, in connection with the International Live Stock Exposition.

The National Association of State Food Commissioners, in recent session at Buffalo, elected A. H. Jones, Food Commissioner of Illinois, as president. The convention reindorsed the Grout bill, and some such bill as the Brosius bill; also passed a resolution in favor of the passage of a National law regulating the sale of dairy and food products, and the appointment of a National commissioner to enforce same, with power to make rulings, etc. The convention also appointed Hon. H. C. Adams, Commissioner of Wisconsin, as a committee of one to attend the session of Congress and look after securing the passage of the bill.

The twelfth annual meeting of the Missouri Dairymen's Association was held at Palmyra November 6-8.

The Minnesota State Butter and Cheese Makers' Association will meet at St. Cloud, November 20-21; secretary, J. K. Bennett, Clinton Falls, Minn.

The Wisconsin Dairymen's Association will meet at Menominee February 12-16, 1902; secretary, Geo. W. Burchard, Fort Atkinson, Wis.

The National Dairymen's Association will meet at Lincoln January 22-24, 1902; secretary S. C. Bassett, Gibbon, Neb.

The South Dakota Dairy and Buttermakers' Association will meet at Huron December 4-5; secretary, J. H. Hubbard, De Smet, S. D.

The Vermont Dairymen's Association will meet at Montpelier January 7-9, 1902; secretary, F. S. Davis, North Pomfret, Vt.

California's orange and lemon shipments this season are expected to reach 26,000 cars.

The annual meeting of the Virginia State Horticultural Society will be held in the Chamber of Commerce Hall, Richmond, Va., January 7-8, 1902. The Society extends a cordial invitation to any visitors who wish to attend; they can feel assured of receiving a hearty welcome. Secretary-treasurer, Walter Whately.

The prominent rank attained by the students of the Iowa Dairy School in State and National contests has led to a demand for special instruction in the use of starters and flavors and the use of the acid test in butter making. This course will begin January 2, 1902, and continue 10 days. No one but experienced buttermakers who have had entire charge of creameries will be admitted. Beginning January 13, 1902, and continuing four weeks, a short course of instruction will be given in practical butter and cheese making and the related scientific and technical subjects, including dairy bacteriology, dairy chemistry, butter scoring, dairy machinery, and dairy bookkeeping. A short course in stock judging and grain scoring will be given January 6-8, 1902. For any further information address C. F. Curtiss, Director, Ames, Iowa.

Prof. W. D. Gibbs, of the Ohio State University, has been appointed as Director and Professor of Agriculture of the New Hampshire State Experiment Station at Durham.

Olean, N. Y., is the place and December 11 and 12 the time for the next annual convention of New York State Dairymen's Association. Full particulars will be given at a later date.

THE FUTURE OF THE KIEFFER PEAR.

In the Brevities of a late copy of THE R. N.-Y. you say the "Kieffer pear has taken a back seat." Now give us a reason for the faith that is in you. I have a year-old orchard, and contemplate planting more unless it shall appear that you are right. L. W. R.

Benton Harbor, Mich.

R. N.-Y.—We have been watching the Kieffer pear closely in this market. A few years ago in New York, during its season, the push carts and fruit stands were well covered with it. Many were sold to eat out of the hand, and the result, nine times out of 10, was evidently a disappointment. Gradually the fruit has disappeared from these retail stands, until now it is rarely seen. This is good evidence that the buying public recognize it, and will not buy it for eating from the hand. We believe that its sale will be limited to the demand for canning purposes, and there are few better fruits for this purpose. In order to make sure we have asked some leading fruit dealers for opinions as to the future trade in Kieffers. Here they are:

It is a fact the Kieffer do not begin to bring the prices that other varieties of pear do; and in our section of the country they seem to be overdone—too many being grown, and the consequence is that they are selling low and at unsatisfactory prices. We receive quite a great many of them from the Eastern Shore, Maryland and Delaware, and judging from our experience of the past few years, we feel that there are enough trees already on there to supply the wants of the trade in Kieffer pears for a long time to come. STEVENS BROTHERS.

Baltimore, Md.

The Kieffer acreage is quite large in our own and adjoining States, New Jersey, Delaware and Maryland, and up to this date orchards with fruit of clear color and good size have paid nice profits. A large portion of the orchards produce fruit that is dark and cloudy; such sells at much lower prices, as the fruiterers don't want them, and they barely pay the producer. The foreign demand seems increasing somewhat. This will help to relieve the market, and it may be that large increased production might pay many years to come. Our judgment would be that for farmers having very light loamy soil, even if sterile, it may be one of the best crops to grow, the rich dark soil being given to other crops, hay, grain, etc., as it is the poorest light sandy soil, as a rule, that grows the cleanest, clearest colored fruit.

New York. S. H. & E. H. FROST.

Our opinion is that the Kieffer pear business is very much overdone, and instead of planting more trees they would better cut some down. It is no doubt a fact that it is a poor pear for eating out of the hand, and if it was not for the canners it would bring very little, owing to the large quantities produced. As we understand it, the canners this year have contracted for them at about 17 to 20 cents for five-eighths baskets, and we should not suppose that the grower would get rich at these prices. The Kieffer pear has no doubt hurt the sale of a good many other kinds, such as Duchess, etc., as the Kieffers are good lookers and the price is always lower. Of course, they do not affect the sale of Bartletts and Seckels, and that class of fine pears. We believe you would be doing a good work if you would advocate not planting too many Kieffer pears.

Philadelphia. BROWN & M'MAHON.

The Kieffer is not a very desirable pear for eating; it is beautiful to look at, in fact, even far superior in looks to many more desirable pears. This year the Kieffers sold very well, considering the quantity coming to market, and the reason is that other varieties were much scarcer, otherwise they would have fared badly. Last year Kieffer pears were in enormous supply and brought but very little by the barrel. We would hardly advise planting this tree with a view to making it profitable. Of course, we understand it yields largely, and is a late pear, when others are out of market, but it is only the appearance that sells it at any time. Customers are generally dissatisfied when they buy it, thinking it is an eatable pear. It may be very good for canning or cooking; in fact, in the South it is a pear which they prefer to all others, probably because they have no others. ARCHDEACON & CO.

New York.

The Demand for Good Apples.

The following notes are from proprietors of New York restaurants who do a large trade every day. We find that the demand for fruit of high quality is constantly growing:

We find either the Baldwin, Pippin or Northern Spy give the most general satisfaction and bake the best. There is a growing demand for good baking apples, and if such were served in a restaurant the sales could be largely increased. BAILEY RESTAURANT CO.

The varieties of apples most suited to our purpose are Greenings and Baldwins; Kings and Northern Spies are very good also, but do not save well. Apples seem to be growing more scarce each year, but judging from what our dealer says, who is in communication with the whole apple country, good saving varieties will be very scarce this year. I should think all farmers who are in the apple growing sections, that is, where it has been proven that apples grow well, would do well to set out a number of trees, and I have found from my own experience that they are about the most profitable crop that can be raised, provided they are well cared for.

CHILDS UNIQUE DAIRY CO.

The Crop of Florida Oranges.

Will the Florida orange crop be much larger than last year? Are there any good oranges north of Tampa? Are the growers inclined to pick the fruit green?

As near as we can judge from the various reports in, estimates are about 1,000,000 boxes of oranges, about the same crop as last season. There are some good oranges north of Tampa. Fruit is allowed to be fairly colored before gathering. PORTER BROS.

The orange crop will be much larger than last season; estimates from reliable sources put it about 1,000,000 boxes. There are very nice oranges grown in some sections north of Tampa. We don't think the growers generally are inclined to pick the fruit green, as it is not advantageous to do so, although some have been coming in that condition. M'CORMICK, HUBBS & CO.

As near as we can learn there are from 1,000,000 to 1,250,000 boxes in Florida this season. The crop is certainly larger than last season, and it is also scattered over a wide area, sections having oranges this season which have not had any since the great freeze which occurred several years back. Even Marion County is estimated as having 10,000 boxes; fruit from there formerly was very good. From information we learn that the crop of grape fruit is much smaller than last year. We already have had several hundred boxes of oranges from Florida, and while some of the fruit is of poor quality others are fairly good for so early. We are satisfied a good share of the growers who have fruit showing the slightest sign of ripeness are inclined to ship. We can see no reason why they should hold back, when there is any quantity of green immature Jamaicas sent here, and which the trade is willing to work on. In our judgment this green immature fruit which is sent here from Jamaica should be stopped.

P. RUHLMAN & CO.

Woman and Home

From Day to Day.

THE BAD BOY'S BRAVERY.

I ain't afraid of lickin's
  And I ain't afraid to stay
Away from school sometimes
  When no one says I may;
I ain't afraid to jump
  On cars that's runnin' fast,
I ain't afraid of horses,
  And I bet you that I dast
Throw pebbles at the grocery boy
  When he goes drivin' past;
I ain't afraid of Grandma
  And I ain't afraid of Pa;
I ain't afraid of nothing
  A body ever saw.
And once I shot a pistol
  And nearly hit the mark—
But I wish folks needn't ever
  Go to bed up where it's dark.

—Chicago Record-Herald.

*

EVERY girl ought to be taught to pick her companions, but not necessarily to pick them to pieces.

*

THE most thoroughly adequate sweeping cap we have seen was made in the shape of an apron, 12 inches wide and 24 inches long, put into a band without gathers. The band, which ends in short strings, is passed around the forehead, and tied at the back of the neck. This cap protects the head thoroughly, does not disarrange the hair, and can be washed and ironed as easily as a duster. It is not so picturesque as a coquettish mob cap with a frill, but it does the work expected of it far better.

*

ONE of our friends who believes in a place for everything, has a number of racks made to store window screens during the Winter. The racks are made of inch strips, each one being large enough to contain the screens from one room, slipped in on edge. Each rack is marked with the name of the room to which it belongs, so, when the screens are needed again, there is no hunt through a careless pile to find the one wanted. The racks take up little room in the attic, and there is no risk of screens being warped or knocked around.

*

WE have heard of an unusual number of cases this Fall where serious trouble has resulted from ivy poisoning, and it sees a matter where a little nature study is urgently needed. Poison ivy (botanically, Rhus radicans) is also known as poison oak; three-leaved ivy, mercury or markry, markweed and pickry. It is not a true ivy, but forms a fringe of aerial roots, which holds it to its support, as the true ivy does. Though usually climbing or trailing, it sometimes grows in shrub form. Its leaves are variable in shape, often like box elder, but grow three in a cluster, a peculiarity which at once distinguishes it from the innocent five-fingered Virginia creeper. It has waxy white berries that often remain on the plant all Winter. The poison is an oil, insoluble in water; therefore, it can only be washed off the skin with alcohol. Witch hazel is a good remedy for ivy poisoning, and one usually at hand, but the best application is an alcoholic solution of sugar of lead. The alcohol should not be too strong (50 to 75 per cent); to this powdered sugar of lead is added until no more will easily dissolve. This is rubbed well into the affected skin, and repeated as necessary. This lead solution is very poisonous if taken internally. As a means of destroying the poison ivy, concentrated sulphuric acid is recommended, a half teaspoonful being applied to the roots every few weeks during the growing season. The acid must be handled carefully, as it is highly corrosive. Wood overgrown with poison ivy should never be used as fuel, as the fumes from it often cause a painful affection of the eyes. This malignant plant takes on such brilliant tints in the Autumn that people often pluck the gorgeous leaves for ornaments, to repent bitterly at leisure, though some are immune against it.

A READER asks how to clean light-colored gloves with dry powder. We always clean light gloves with benzine, but the following dry cleaning is recommended: First rub with clean flannel and cream of tartar. Leave for an hour,

3954 Home Gown.
32 to 42 Bust.

then rub with fuller's earth and powdered alum in equal parts. Next day brush with a clean, soft brush, and finish by rubbing with dry oatmeal to which a little whiting has been added, following with a dry cloth for a final rub. This is a good way to clean white kid slippers. Benzine gives a satisfactory method of cleansing light kid, and if the articles are hung in an airy place for several hours afterward the odor passes away. It must always be remembered, however, that the benzine is highly inflammable and explosive. It should be used by daylight only, and kept away from the vicinity of any fire. A high-grade benzine should be used only, as there appears to be danger of ignition from friction with a poor quality. Chloroform is also used to clean gloves.

*

ONE often meets with people who proudly declare that they never change their minds, apparently under the impression that an unchanging adherence to a wrong idea is more commendable than an occasional variation towards a right one. The fact is that such people resemble the lobster in the "Water Babies," who preferred to lose his claw rather than let go, after once taking hold. Few people are so wise that they never need to change their minds. Down near Salem, Mass., are two old-maid sisters of the name of Witherspoon, who quarreled over the seats they should occupy at the funeral of their mother. The elder claimed the privilege of sitting next to the coffin. The younger assented, but when the service began took her chair around to the other side, so that she sat next to the coffin, also, and, as it happened, on the right side. The elder, indignant at being outwitted in such a manner, vowed that she would never speak to her sister again, and has been stubborn enough to hold her tongue. Living near Newburyport, Mass., are two sisters who, in 1879, quarreled over the best method of preserving tomatoes. They separated in anger, both refused to apologize, and, although they live in the same town, they have never made up or spoken to each other since. Their husbands and families are friendly, and visit back and forth daily. Such people as these would certainly do well to change their minds for another and a better one.

The Rural Patterns.

The pretty home gown shown is made of turquoise blue challie with black figures, the front and undersleeves being of plain blue Sapho satin; the revers of black velvet and the edging of fancy galloon, in which threads of gold are woven; but many equally satisfactory materials might be suggested. Cashmere, albatross, princess crepe, nun's veiling and French flannel are all fashionable, while soft silk always makes a handsome gown. The back is fitted with a center seam, side-backs and underarm gores, that curve to the figure and give a princess effect. The full front is tucked to yoke depth, then falls free, its edges being attached under the fronts proper, which are turned back to form revers. Beneath is a snugly fitted body lining that extends slightly below the waist line. The fancy sleeves are arranged over fitted linings and are curved at the lower edge, where they fall over soft puffs. At the front is a velvet ribbon that is attached at the under-arm seams, brought around to the front and bowed. To cut this gown for a woman of medium size 13 yards of material 21 inches wide, 11 yards 27 inches wide, or 7 yards 44 inches wide will be required, with 2¼ yards 21 inches wide for full front and undersleeves and ⅞ yard of velvet to trim as illustrated. The pattern, 3954, is cut in sizes for a 32, 34, 36, 38, 40 and 42 inch bust measure; price, 10 cents, from this office.

The graceful walking skirt shown includes some of the newest features. The back is cut with the new ripple that falls in graceful folds from a few inches below the belt, and the flounce means both flare and freedom. The original is made of homespun in mixed shades of brown and tan, but all checks, cheviots and skirting materials are appropriate. The skirt is cut in five gores, the side gores being narrow, and is without fullness at the belt. The flounce is graduated in width, and is seamed to the lower edge. At the right side is placed a patch pocket with turn-over flap. To cut this skirt for a woman of medium size 6⅛ yards of material 27 inches wide,

3916 Walking Skirt.
22 to 30 waist.

3⅞ yards 44 inches wide, or 3⅜ yards 50 inches wide will be required. The pattern, 3916, is cut in sizes for a 22, 24, 26, 28 and 30-inch waist measurement; price, 10 cents.

PREACHING and prayer are good for those who can attend upon them, but they will never by themselves convince the world. It is action and example, a life fully lived out, that has power over mankind.—William H. Fremantle.

GREAT men are the fire-pillars in this dark pilgrimage of mankind; they stand as heavenly signs, everlasting witnesses of what has been, prophetic tokens of what may still be, the revealed, embodied possibilities of human nature.—Thomas Carlyle.

A Photographic Competition.

PRIZES FOR PICTURES OF HOUSEHOLD SUBJECTS.

As anuounced three weeks ago, the Woman and Home Department offers the following prizes for the best pictures illustrating domestic subjects:

First Prize, $7.00
Second Prize, $5.00
Third Prize, $3.00

The subject should illustrate, preferably, some idea of convenience, comfort, or saving of labor, but domestic episodes which form effective pictures will be considered. We desire photographs that show something, but that will also make attractive pictures. The prize winners will be asked to furnish descriptive notes to accompany the illustrations. The competition will be open until December 1. In addition to the prize-winners, other pictures which, though failing to receive a prize, are still considered worthy of use in illustrating, will be paid for upon use at our regular rates. Address all matter relating to this to the Woman and Home Department of THE R. N.-Y.

A Trek to the South.

PART II.

Passing through Keeseville, we finally reached a lovely place, beside a dear little lake, where we staid over night. The people were as good and kind to us as they could be. We were off early, and then, on our way, had breakfast. At noon we reached a pine grove, nice and dry, and I went to a cottage, made some tea, and we had a real good lunch. While I was fixing the tea, I talked to the woman, and fouud out that she was 48 years old, and had had 16 children. I asked her when she was married, and she said, 'When I was 18." I remarked:

"Well, that did not give you much time for fun beforehand."

She was mopping the floor, and she gave the mop a fliug, with:

"Well, I'm sure I have not had much fun since!"

The horses are well, and Gray felt so good that she wanted to roll with her harness on. We shall not run any risks, and, till it is warm and dry, will not camp out nights. There are ways and places of stopping so that it will not be too expensive for our pocketbooks, and we are getting on nicely and having a good time. You remember who it was that said, "It does not do to be too proud; one ought to accept things?" I am going to try this Summer and see how that works.

Fred has his first soldering job. Where we are staying the tea kettle and coffee pot had given out. Fred is glad to fix them. We are putting up here till Monday. The people are French, and are very nice. We find that we cannot go very fast, but we will get there in time, all the same.

CONSUMPTION

Right food—right medicine—right time—these three things are of the utmost importance to the consumptive. Right food and right medicine—these are contained in Scott's Emulsion of pure cod-liver oil. Right time is at first sign of disease. Right time is now.

Scott's Emulsion always helps, often cures. Ordinary food helps feed. Fresh air helps cure. Scott's Emulsion does both. Begin early.

We'll send you a little to try, if you like.
SCOTT & BOWNE, 409 Pearl street, New York.

In the morning we started in good spirits for the Gap. We were right in the mountains, and climbed up, up, up. At last we got out and looked around, and it was lovely. We walked miles that day. At noon we camped under a large pine and had our lunch of chicken, horseradish, bread and butter, tea and cookies. But we don't feel much like eating, and are not lightening the load as fast as the horses are. After giving them a good rest, we started off again; and in a little while reached the Bouquet River, a beautiful stream; then we reached Elizabethtown, and Fred came out of the post-office, his face all beaming, the "Hawk's" letter in his hand. My, I was glad to get it!

I do not wonder that people like the Adirondacks; for it is just grand. Our carriage brake is fine, and it was fun to see Fred work it at first. Tell Brother Seldon that yesterday we passed a band of gypsies, and the man smiled on Fred and wanted to trade horses. He insisted that he wanted to trade, and we had hard work to get away. He thought he had met a friend and fellow traveler. Elizabethtown is a lovely place, just out from the forest, and has five hotels, four churches and very many fine shade trees. It is quiet and homelike, for the city people have not reached there yet. After we left it we followed the river a long way, but Fred would not stop to fish, for he wanted to reach the "Promised Land." Then we turned off, and up through scattered hamlets all the afternoon. At seven o'clock we found a place to stop, and as we had to leave the carriage out doors, Fred chained McKinley under it. He would not let anyone go near it. We made an early start next morning, and then again up, up, up, we went. Had to walk, and Fred put on the brake three times on the hill and rested the horses. All day we were climbing hills, and at last we went down some, toward night. I said to Fred:

"Well, dear, this is like life; it is not *all* up hill."

He looked at me with his first smile since we started, and answered:

"We are sometimes up, and we are sometimes down; but still, we are southward bound."

Well, it was through the woods, "the forest primeval," hour after hour. At night we came to a schoolhouse just off the road, and I was so tired that we stopped there. There was a good shed near. I thought I was in Jersey, for the whippoorwill sang all night. I was so glad to hear it again. I said to Fred the next day that I did not see why they made such a fuss over the cutting down of the Adirondacks, for we must have passed at least three or four dozen trees the day before (?).

Well, we followed roaring torrents; drove on the edge of precipices, climbed high mountains, and crossed rivers. (I just read this to Fred, and he said, "You take too much poetic license, you!")

Of all the lovely places I have ever seen, Schroon Lake is the most beautiful. Lots of hotels and churches, and so much wealth. On one place they had a lawn of about four acres. We followed the river from there, and at last it took us into the woods again, and we had our dinner. On again in the woods, and about two o'clock we came to a fork in the road, and did not know which to take; so Fred left me and walked over a mile to find out at a hut, where they were so very poor that they were all in rags; but one of the boys had a "bike," and the other boy was trying to get one. I told Fred that I wished I had let him go the road he wanted to. He jumped in the wagon with a laugh. "If we had taken the wrong road you would have told the Hawk that 'Fred was on one of his exploring expeditions.'" Towards dusk we found a deserted place, with a nice barn for the horses, and a shed for the wagon. We had a good night's rest.

As Fred was walking his horses at Warrensburg a nice hotel-keeper came out and talked to us. He liked our wagon, and said that it was just the thing for camping. I told him that we were dirty and demoralized, and would be taken for gypsies, I was afraid. He laughed, and said that he went camping every Summer, and that people took him for everything except what he really was. We are treated so nicely and everyone takes us for what we are. The road from Warrensburg is a toll road, and lovely, and we went along fairly well. We found a change of trees there. We came to our dear old chestnuts, and they are used for railroad ties and for other things, as we use cedar at home. In the Adirondacks there is a good deal of variety in the soil. Lake George is lovely. We had a beautiful afternoon. I would have liked to stay there a week, but we had to get on. We struck right into a good road, through sand and woods. After going quite a way, we found a place where we would spend the night, but, as Fred said, "Their noses were too red for him," so we went on, and after a while we came to a house where there were three rough-looking men, so we went again, struggling through the sand and dark. Fred walked and I sat in the carriage with drooping spirits. At about nine o'clock we saw a break in the trees, and a nice brick house. The man was just closing up for the night. He let us put our horses in the barn, and we drew up the carriage close to the house. They were very nice, and we had a good night's rest. They caught that same storm that we had the afternoon we left home, but up there it was terrible. When the woman of the house saw the storm coming she went out to get the milk pans, and the lightning struck them and ran across her chest and down her arm and her leg. They took her into the house, and she had just got so that she could stand on her feet, and they thought she would be a long time getting over the shock. Her mother and sister were taking care of her. The sister was a bright young girl. The land is so very poor; no grain but buckwheat is raised. She said: "We do not depend on our farms for our support; it is from the lumber that the money comes." I asked them if they did not get lonely. "Why, no; we have neighbors!" So they had, a mile away. Well, we started off early the next morning, and, as we drove along, saw lots of lumber and sawmills.

We reached Luzerne early. It is a charming place; four churches and nice stores. There we crossed the Hudson, and reached Hadley. The mail was just in, and so we got your letters, ordered the others to be sent on, and Fred sent the little pine trees, one for each of our three nieces and one for our dear Hawk. (They came safe, and "the Hawk's" is growing well, and is a beautiful little tree.)

We soon left Hadley, and into sand and pine trees again. We followed the Sacondaga River, and found at last a lovely camping ground in the pines, and strawberries near. Went to the river and had a good bath, then supper, and then to bed. At about 10 o'clock the horses were so uneasy that Fred was afraid to leave them tied, so he loosened them, and we watched them. They both started for home, and he had a good chase for them, but all returned at last, safe and sound, and we went to bed again. In the morning we traveled over the worst road we have yet struck, and we do not live in the sand hills down South, you better believe! We have had enough sand to last us the rest of our lives. We passed five hamlets, and then found a farmhouse and a nice place for the horses, and had a good night's rest. When we awoke the ducks were quacking, and Fred asked me if it did not seem like home. They are kind, nice people, and they have a lot of children; all great singers. A lovely boy, 17 years old or so, with curls. I went to get some water to wash the dishes, and told his mother that it was a shame for boys to have curls; that my husband had curls when I married him, but he said that I had taken all the curl out of his hair. The boy said, "Women are enough to take the curl out of any man's hair." We go over 20 miles a day. That is all we can do at first. When we get out of this sand and on hard roads we can do better.

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

Pocket Money for Home Girls

All honor to the girl who wishes to earn money, and yet feels it her duty to stay at home and "Make things pleasant in one little place." Not knowing the circumstances and situation of her home, it is not easy to advise, but the result of different experiences may be recorded. There are many girls who have undertaken the care of poultry, on shares, or with a little flock of their own on their homestead, and found it profitable, when near a town market. I know a girl who lives with her widowed mother, and has a garden where she keeps bees. She has overcome all fear of them, and studied their habits and management to advantage. I spoke to her recently, and she said that the bees had wintered and summered well; that the season had been profitable. The pound sections sold at from 12 to 15 cents, and the strained honey at 10 cents per pound. Wax was troublesome to manage, but when melted and clarified brought 30 cents per pound, and found ready sale, as the nuns were anxious to get it for candles. She could not tell me the value of each hive, but had found it a profitable business.

Then Lillie Baylis wanted some pocket money, and the only thing she knew how to make that she thought salable was peanut brittle and butter scotch. She spoke to a prominent grocer in a near-by town. He entered into the project, only insisting that the name "L. Baylis" be printed on each box. He gave it a trial, and sent for more, and Lillie had to get an assistant the next year.

I know a girl who bought a crate of jelly pots and a barrel of sugar. She gathered all the small apples and windfalls in her father's orchard, and made delicious apple jelly, that found ready sale. Another bright little girl who made ice cream that everybody liked, gave some of her time to the subject, and takes orders from the Summer residents, that pay her well. Many years ago in THE R. N.-Y., I gave an account of an acre of ground that brought me in over $100 a year in celery, besides other marketable products. The same land now brings that money from the sale of currants and grapes. The latter are sold quite cheap to a girl, who makes grape juice and sells it to customers at 25 cents a bottle. Her friends supply the bottles, and as half a pound of sugar is sufficient for three pints of juice, there is a fair profit, in half-pint bottles. The grapes are first heated in a preserving kettle, the juice then being strained, sugar added, and again brought to a boil, when it is bottled and corked hot—the quicker the better, to avoid fermentation. The work is not difficult nor tiresome. But readers will say, "Everyone has not grapes or land so easily obtained." For these there may be other employments found. The other day, as I sat beside a full basket of undarned socks, I wished that one of these little girls who want money would agree to come in and help, or, if necessary, carry the socks home to mend. But girls have such foolish ideas often that they do not like it to be known that they are willing to work for others. My advice is to put your pride in your pocket and keep it there.

My charwoman, who is often laid up in Winter by rheumatism, earns a good deal of money by making rag rugs. She blends the colors nicely, and sews them strong, so that they are well worth the money paid, and Summer residents purchase them for their country houses. This has become a business in a certain town in Maine, where they have learned to work up wool and cloth in an artistic manner, but any girl who can make colors harmonize can do salable work. I know an old lady, who has to sit most of the time in her chair—yet she has made beautiful knitted counterpanes, that would be preferred by many to ones bought. One lady, with only a back garden, has set up as a florist. She grows the flowers best suited to mix with those she has to purchase, and gets her bulbs in quantity for pots to force for Winter sales. A great feature last Christmas was small grape baskets filled with earth and planted with Roman hyacinths, just in bud, the top of the basket covered with moss, making them very attractive. Each locality must determine for itself the best method of earning money at home, but if I had to choose I should at once take up the business of poultry, as both suitable and interesting, as well as profitable for a girl at home, who knows the meaning of economy.

A woman in the neighborhood adds materially to a limited income by the aid of a knitting machine. She is an expert at the work, and is employed by the large stores in the near-by city, to make socks and stockings, mitts and caps. It is work that any young girl can learn, and is interesting and clean.

ANNIE L. JACK.

A Boon To Humanity

Is what everybody says who has used

St. Jacobs Oil

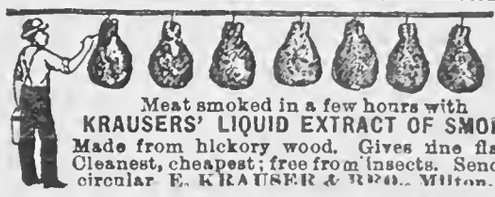
For it cures the most difficult cases of Rheumatism—after every other form of treatment has failed.

St. Jacobs Oil never fails.

It Conquers Pain

Price, 25c and 50c.

SOLD BY ALL DEALERS IN MEDICINE



Meat smoked in a few hours with KRAUSERS' LIQUID EXTRACT OF SMOKE. Made from hickory wood. Gives fine flavor. Cleanest, cheapest; free from insects. Send for circular. E. KRAUSER & BRO., Milton, Pa.

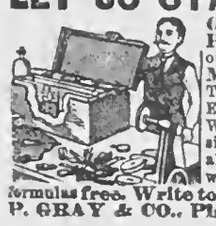
LET US START YOU! $20 to $40 Weekly and expenses, Men and Women—at home or traveling. Our agents and salesmen made over $600,000.00 last year supplying enormous demand for our famous Quaker Bath Cabinet and appointing agents. Wonderful seller. No Scheme or Fake Methods. WRITE today for NEW PROPOSITION, PLANS, ETC., FREE. World Mfg. Co., 6 World B'ld'g, Cincinnati, O.

[We recommend above firm as reliable.—Editor.]

SALESMEN AND AGENTS WANTED

BIG WAGES—Our Famous Puritan Water Still, a wonderful invention—not a filter. 22,000 already sold. Demand enormous. Everybody buys. Over the kitchen stove it furnishes plenty of distilled, aerated drinking water, pure, delicious and safe. Only method. Distilled Water cures Dyspepsia, Stomach, Bowel, Kidney, Bladder and Heart Troubles; prevents fevers and sickness. Write for Booklet, New Plan, Terms, etc. FREE. Harrison Mfg. Co., 422 Harrison Bldg., Cincinnati, O.

LET US START YOU! $100.00 MONTHLY



Gold, Silver, Nickel and Metal Plating. At home or traveling, taking orders, using and selling Prof. Gray's Machines. Plates Watches, Jewelry, Tableware, Bicycles, all metal goods. No Experience. Heavy plate. New methods. We do plating, manufacture outfits, all sizes. Guaranteed. Only outfits complete, all tools, lathes, material, etc., ready for work. We teach you, furnish secrets, formulas free. Write today. Pamphlet, samples, etc. FREE. P. GRAY & CO., Plating Works, CINCINNATI, O.

FAMILY OF DOLLS FREE

Of course every little girl loves a Doll, but how delighted she would be with a whole family of Dolls with which to "play house." Besides the Boy and Girl Dolls here pictured, there is a Grandpa and a Grandma Doll. Grandpa in full military uniform, and Grandma in the dainty costume of the olden time. The large dolls are nearly two feet high, the small ones 15 inches. They have rosy cheeks, beautiful hair, heads that will not break, eyes that will not fall in, and are handsomely dressed in bright colors that will not fade. Words can never express the delight which any child will feel in possessing this Doll family. We will give these four beautiful dolls absolutely free for selling only five boxes of our Laxative Stomach Tablets at 25 cents a box. Write to-day and we will send the Tablets by mail postpaid. When sold send us the money. ($1.25) and we will send you the family of four dolls at once. Address, NATIONAL MEDICINE CO., Premium Dept. 134 L, New Haven, Conn.

BUSINESS BITS.

HAMILTON & CO, Rosenvick, Chester Co., Pa., breeders and shippers of choice pure-bred hogs and poultry, have lately got out new circulars that give full information about their stock, prices, mode of doing business, etc. They will be pleased to send them free to anyone wishing stock, who will send his address.

BEFORE Winter sets in we hope all our readers will see that there are no cracks in their poultry houses or cattle barns—it costs more for extra feed than it will to stop up the cracks. The Neponset Red Rope roofing is excellent for this purpose; it is both waterproof and windproof. F. W. Bird & Son, E. Walpole, Mass., will gladly send you sample if you request it. A postal will do.

WE don't know when we have seen more good hard sense in a pamphlet than is found in "The Egg Subject," written by H. B. Humphrey. It deals with egg production in a practical manner, pointing out how to get eggs when bringing the highest prices, and its conclusions are based on proven facts—not on idle theories. Mr. Humphrey will send a copy to any of our readers who ask for it. Address Humphrey & Sons, Box 39, Joliet, Ill.

"MORE Money from Your Hens" is the title of a new book issued by the Stratton Mfg. Co., of Erie, Pa., manufacturers of the well-known line of Dandy green bone cutters. It is attractively printed in two colors, well illustrated, and goes into the question of making poultry profitable in a very thorough manner. Of course, it places special emphasis on the value of freshly-cut green bone as an egg producer and growth promoter. There is no doubt in the minds of poultry raisers that a little green bone added to the feeding ration is productive of the very best results in two ways; it not only saves in the grain bill, an important feature this Fall when grain is high, but it also makes the poultry more productive in every way. You will be interested in the handsome book which they send free.

TECUMSEH PARK, Springfield, O., was occupied on September 28 by 500 employees of the Foos Manufacturing Company, of that city, accompanied by their families and friends, as guests of the company in al fresco entertainment. The spontaneous gaiety of the great party was due to the good feeling between employer and employees in this big manufacturing plant—a good feeling that is daily reflected in a tremendous output of grinding mills, portable forges and blacksmith tools of the very highest quality. A very fine dinner was spread and many entertaining diversions supplied, including music from a famous orchestra. The Foos Manufacturing Company affords an example worthy of general emulation, certainly, one that would redound to the honor of any employer, and incidentally afford a monetary return. Such kindly thought and consideration of the welfare of the employed is only too rare.

PROBABLY there are very few of our readers who do not know by name, and favorably by reputation, the Keystone Farm Machine Co. of York, Pa. These people have this season brought out a number of new machines of interest to the farmer, but probably no one of them so deserving of notice as their new "Keystone Tony" feed cutter, which is a distinct advance on their previous efforts. For some time they have made and sold a machine under the above name, but the new pattern has fully double the capacity of the old, and without requiring any noticeable increase in power. This somewhat remarkable result is obtained by the double knives and eccentrics. This feature feeds the machine accurately and rapidly, and the double knives take care of the increased quantity as readily as in the single machine formerly made. Intelligent farmers are all convinced of the economy of feeding cut feed. It will be particularly valuable to the average farmer and stockman, and it is a source of genuine profit to the dairyman. The manufacturers will very gladly send their catalogues and descriptive circulars on application. Write for them to-day, and address Keystone Farm Machine Co., 1547 N. Beaver street., York, Pa.

CONSUMPTION CURED.

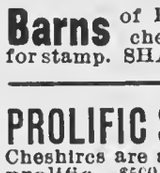
An old physician, retired from practice, had placed in his hands by an East India missionary the formula of a simple vegetable remedy for the speedy and permanent cure of Consumption, Bronchitis, Catarrh, Asthma and all Throat and Lung Affections; also a positive and radical cure for Nervous Debility and all Nervous Complaints. Having tested its wonderful curative powers in thousands of cases, and desiring to relieve human suffering, I will send free of charge to all who wish it, this recipe, in German, French or English, with full directions for preparing and using. Sent by mail by addressing, with stamp, naming this paper, W. A. Noyes, *847 Powers Block, Rochester, N. Y.*

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

Wants, For Sale or Exchange

WANTED—Farmers and Dairymen, $30 to $50, with house or board. Only competent men with good references. The Rural Agency, Durham, N. H.

Fine Farms and Orchards in the great Piedmont Fruit, Grain and Stock section of Virginia. Elegant water and climate, with best educational advantages, and near great markets. For further information address JOHN L. McCUE, Afton, Va.



"I OWN MY HOME."
That's what puts nerve and backbone into a man. We sell them on the easiest terms. More than a hundred to choose from in our Illustrated Real Estate Catalogue Mailed free Write to-day.
W. F. Allen Land & Imp. Co., Salisbury, Md.

GLENN RANCH,

Glenn County, California,

FOR SALE IN SUBDIVISIONS.

This famous and well-known farm, the home of the late Dr. Glenn, "the wheat king," has been surveyed and subdivided. It is offered for sale in any sized government subdivision at remarkably low prices, and in no case, it is believed, exceeding what it is assessed for County and State taxation purposes.

This great ranch of 40,000 acres runs up and down the western bank of the Sacramento River for 15 miles. It is located in a region that has never lacked an ample rainfall, and no irrigation is required.

The river is navigable at all seasons of the year, and freight and trading boats make regular trips.

The closest personal inspection of the land by proposed purchasers is invited. Parties desiring to look at the land should go to Chico, California.

For further particulars and for maps, showing the subdivisions and prices per acre, address personally or by letter,

F. C. LUSK,

Agent of N. D. Rideout, Administrator of the Estate of H. J. Glenn, of Chico, Butte County, California.

Barns of Plank save Timber and cash. Best, cheapest, strongest; 4,000 in use. Book for stamp. SHAWVER BROS, Bellefontaine, Ohio.

PROLIFIC SWINE—Three sows just farrowed 14, 13 and 12 pigs. The Cheshires are as kind and good milkers as they are prolific. $500 from one sow. Illustrated Catalogue—History of Breed, Methods of Feeding sent for 2c. stamp. C. E. CHAPMAN, Peruville, N. Y.

Oldest Commission House in New York. Established 1838. Butter, cheese, eggs, pork, poultry, dressed calves, game, &c. E. B. WOODWARD, 302 Greenwich Street, New York.

POULTRY SHIPPERS.

We make a specialty during the Winter months of handling Poultry, having a very extensive trade. Write us for any information you may wish regarding dressing, packing, etc, and we will be pleased to answer all inquiries.

Returns made on sale of each shipment.
ARCHDEACON & CO., 100 Murray Street, New York.

WELL DRILLING Machines

Over 70 sizes and styles, for drilling either deep or shallow wells in any kind of soil or rock. Mounted on wheels or on sills. With engines or horse powers. Strong, simple and durable. Any mechanic can operate them easily. Send for catalog.
WILLIAMS BROS., Ithaca, N. Y.

BRAND NEW STEEL ROOFING

Bought at Receivers' Sale. Sheets either flat, corrugated or "V" crimped. No tools except a hatchet or hammer is needed to lay the roofing. We furnish free with each order enough paint to cover and nails to lay. Price per square, $1.75
A square means 100 square ft. Write for Free Catalogue No. 57 on General Merchandise. Chicago House Wrecking Co., West 35th and Iron Sts., Chicago, Ill.

Do You Wear Rings?

No. 77.

Perhaps you would like one to use as a holiday remembrance to some friend. We have been able to make arrangements with a manufacturing jeweler by which we can furnish handsome rings with stone settings at surprisingly low prices. These rings are rolled gold, with a five-year guarantee. We offer four styles. No. 77 is a single stone. You can have any color stone or any size ring. Price, 25 cents. No. 81 has three stones, Tiffany shape; you can have any combination of colors, and any size ring. Price, 40 cents. No. 79 is a three-stone baby and misses' ring, any combination of colors, and any size. Price, 25 cents. No. 66 is a cluster of imitation diamonds with center stone, which may be had in any color. Price, 75 cents. No. 55 is an Egeria diamond scarf pin. This is a gold-plated pin on German silver, which gives a high finish. The setting is new and gives a pretty effect. Price, 25 cents. We will send any one of these rings or the pin as a reward for one new subscription at $1, except No. 66. We will send this for a club of two new subscriptions, or with one new and 25 cents extra. Select ruby, sapphire, emerald, opal, turquoise or diamond. Measure size of finger carefully with narrow slip of paper, and send this with order. The rings are sold only to subscribers or their families.

THE RURAL NEW-YORKER, NEW YORK.

10 Weeks for 10 Cents.

Last week we made the announcement on this page that during the months of November and December we would accept subscriptions for new subscribers for 10 weeks for 10 cents, as an inducement to introduce THE R. N.-Y. to 20,000 new homes. January 1 we send 23 cash premiums for clubs sent under this proposition. We are going to ask every reader to send one or more names, and we would suggest to those who can raise a club to begin at once. Every name will receive 10 copies of the paper, but the sooner you begin the better your chances for a holiday premium check. Remember that a new yearly subscription counts 10 in this contest, and the subscriber gets the remaining issues of this year free with his yearly order.

NEW YORK.

BOOK BULLETIN

FOR SALE BY THE RURAL NEW-YORKER.

THE STORY OF GERM LIFE, by Prof. H. W. Conn. Modern methods in agriculture bring both farmer and dairyman in touch with the germ theories of the scientists. Prof. Conn's book throws much light upon these tiny organisms, and their war against mankind, or its enemies. Price, postpaid, 40 cents; cloth bound.

THE LIFE OF THE BEE, by Maurice Maeterlinck. This book is described by nature lovers as "the epic of the bee." It discusses the wonderful communistic life of the hive; the system by which these intelligent insects educate their queen, and feed their young; the pitiless massacre of the drones, and the whole organization of the honey-storing city. It is a remarkable book, combining with its scientific accuracy the poetic charm of style and language which makes Maeterlinck a leader in literary thought. All students of nature should read The Life of the Bee. Price, postpaid, $1.40.

CUT-PRICE BOOKS.—Any of these 20-cent pamphlets sent postpaid for 10 cents:

Cooking Cauliflower.
Fruit Packages.
Country Roads.
Chemicals and Clover.
Canning and Preserving.
Memory Training.
Milk Making and Marketing.
The Modification of Plants by Climate.

THE RURAL NEW YORKER,
409 Pearl Street, New York.

MARKET NOTES

STRING BEANS.—"Where do the string beans and peas come from which I see quoted in New York now?" asks a reader. Before the northern crop is out of the market southern growers have plantings which are ready to be shipped in and fill the gap. Most of those now received come from Virginia and the Carolinas. The trade is not large on account of the variety of other vegetables at this season. Half-barrel baskets of both peas and beans wholesale at $1 to $1.25.

WHEAT EXPORT trade this season has been disappointing to many dealers, while some have met with severe losses. The early reports of short crops in Germany and France were very much exaggerated, and this led to excessive speculation both in wheat futures and ocean freight engagements. Buyers engaged steamer room months ahead at high prices. In many cases they were unable to sub-let this satisfactorily, and in order to avoid total loss of freight engaged, were obliged to ship at times when conditions in foreign markets were unfavorable. This is one of the snags that speculators run against, and long experience in business cannot save them from losses of this sort. Crop estimates are valuable in their way, but there is so much opportunity for error in them that the only report which it is safe to depend upon is the one made after harvest.

CABBAGE is for sale in this market during the whole year. The first of the northern crop is brought in from Long Island about the middle of July, and later large quantities come from central New York and neighboring States. This supply continues until the latter part of April, when $10 to $15 per ton is a common price. In March the new crop from Florida begins to arrive. The first of this is usually small and inferior, and has but a limited sale at from $1.50 to $2.25 per barrel crate. Early in May the Charleston and Norfolk crop is on the way. As old cabbage is then practically out of the market, the price usually runs up to $2.50 to $3 per barrel crate. The heads are small, but the quality is fair, and sales are quite satisfactory until the new northern crop comes in better condition and quality, and takes its place. The Long Island crop within hauling distance (20 or 25 miles) is brought in in wagons piled up as high as small loads of hay, and covered with canvas. That from a distance comes loose in cars, and thus has to be handled so much that the outer leaves get torn and have to be removed. Considerable cabbage is repacked in barrels or crates and shipped from New York to suburban or more distant towns. This is done with many other kinds of produce, and it sometimes happens that this stuff is shipped back to towns through which the farmer has passed with his load of produce in coming to New York. At present Long Island cabbage sells for $2 to $3.50 per 100. W. W. H.

National Grange Meeting.

The thirty-fifth annual session of the National Grange will be held at Lewiston, Me., commencing November 13. Most of the railroads make the usual concession of one and one-third fare for round trip. Full fare must be paid for the ticket to Lewiston. The agent will give a certificate which is to be signed by the secretary of the National Grange, and the special railroad agent at some time during the meeting. On presenting this to the ticket agent at Lewiston, a return ticket for continuous passage over the same line will be issued at one-third fare. Agents at small stations should be notified in advance, as the blank certificates are not distributed to all stations unless ordered, and the reduced rate from Lewiston cannot be obtained without this proof that a full fare has been paid to the meeting.

Cost of Grain Shipments.

At the recent meeting of the National Grain Dealers' Association at Des Moines, Iowa, Gov. Shaw said among other things: "When the first bushel of wheat was transported by rail from the Missouri River to the Atlantic Ocean, thence by ship to Liverpool, it cost 61 cents thus to market it. It now costs 21½ cents to take a bushel of wheat from the Missouri River to Liverpool. This is due to improved roadbeds, lighter grades, fewer curves, heavier iron and larger locomotives. Our people all understand this and they are both contented and happy. They are building better houses, planning better schools, putting more pianos in their parlors, more books on their shelves, more sunshine in their homes and are advancing the prices of their farms. These can now be rented for cash and will pay a better income for twice their market value than Government bonds at current quotations."

DOG AND MOON.—There seemed to be just a shade of annoyance in Hope Farm Notes caused primarily by seemingly unjust criticism or pure nagging. Remember the Hoosier farmer's dog story. Every moonlight night the dog sat on a sycamore stump and bayed at the moon. The dog was gritty, and kept at it, but the moon never showed any irritation, not even that tired feeling; went and got full just as usual, and gave forth its reflected light. People sometimes have wondered why the moon did not take a vacation and start a school of gentility for curs. E. D. R.

SPEAKING of the prairie dog pest in that State a Kansas man says: "There are at least ten millions in western Kansas that are plowing up the ground and ravaging the fields of what grain can be found. They will eat anything from pumpkin seed to a scrub oak sapling, and seem to thrive where no other living thing can exist." The last Kansas Legislature appropriated $5,000 to be used in efforts to exterminate the animals. Numerous experiments were tried, but the results were not satisfactory. Now some one comes forward with a proposition to vaccinate these pests with hydrophobia, and set them to killing each other.

CATS AND FLEAS.—In a pamphlet issued by the Department of Agriculture the following is credited to a New York paper: "An excellent way to get rid of fleas is used by a lady in Chicago, who owns some of the best cats in America. She has ready a square of cotton batting and a square of cotton cloth, placing the cat in the center of the batting, which has been laid over the cloth; she rubs strong spirits of camphor quickly into the fur and then gathers the corners of the batting and cloth tight around the neck of the animal. She has a fine comb ready and a dish of hot water, for the pests, who detest the camphor, will run to the head of the cat, and must be combed out and plunged into the scalding water. Hundreds of them, however, will jump from the cat and lodge in the cotton batting, where their scaly feet stick in the cotton so that they cannot get away. When the fleas cease to run out on to the head of the cat she judges that they have deserted the cat. The animal is then let out of the batting bag, and the latter carefully carried to the kitchen and deposited in the stove. The scent of the camphor clings to the cat for some time and acts as a preventive. A whole cattery may be cleaned out in this way."

OIL-BURNING LOCOMOTIVES.—On some of the western and southwestern railroads crude petroleum is to be used as fuel in the place of coal. Of course, this will mean a change in the shape and size of the engine, since burning a liquid fuel is a very different thing from a coal burner. A report from California gives the following description of a new oil-burning engine: "In the oil-burning locomotive just constructed for the North Pacific Coast Railroad the cab is placed at the head of the locomotive over the cowcatcher and the smokestack is set at the rear end. The tender trails behind with its oil and water tanks, and the fluids from both are fed to boiler and furnace in the customary way, the oil pipe being led around the body of the boiler to the fire box, which opens as usual in the cab."

RABIES OR HYDROPHOBIA.—Bulletin No. 79 from the Pennsylvania Department of Agriculture gives an excellent account of this dread disease. The following directions are given for the benefit of persons who may be bitten: "In the event of a bite by an animal supposed to be mad the wound should be cauterized as soon as possible with fuming nitric acid. This should be thoroughly applied to all parts of the wound, making sure that there are no pockets or recesses which escape the action of the acid. If such cauterization is carried out within 24 hours of the reception of the wound, the danger is very much lessened, and if done within a few hours the protection is absolute. In the absence of fuming nitric acid the hot iron or the thermo-cautery, or even strong antiseptics may be used, but experiments have shown that nitric acid is the most efficient. The invariable rule should be: *Cauterize as soon as possible, and in the meantime do everything to get the virus out of the wound*, by washing in an abundance of water, enlarging the wound and encouraging free bleeding by cupping or the application of ligatures around the limb above the site of injury. Osler advises that the wound be kept open for five or six weeks. The animal which inflicted the wound *should in no case be killed, but should be captured, if possible, and confined for observation.* In this way it is often possible to determine positively within a day or two whether the animal was really rabid, and much anxiety spared the bitten person. As soon as the animal dies the whole head should be cut off close to the shoulders, packed in ice and sent to the nearest laboratory for examination."

THE R. N.-Y. is very helpful to us. Some object to it on account of its embracing such a range of country in its agricultural information, but this is interesting, and in the case of crop reports highly valuable. Such articles as those by H. E. Cook and others on the details of crop and especially corn cultivation are very useful to us. The articles you print on soil renovation are also useful. We live in quite a grain-growing section, silos are becoming general, and with them more cattle feeding. Moore, Ont. T. E. W.

Miss Maud Kenyon,

Of 1533 Orange Street, Los Angeles, Cal., writes: "I had been afflicted with my eyes for over a year with such a dreadful itching and inflammation that I could not use them for anything. Physicians had given me many different remedies which were like using so much water; they measured my eyes for glasses, which I got and wore for some time, but they did not benefit me in the least. My mother desired me to write to Dr. R. V. Pierce and explain the condition of my eyes. I did so, and after following your advice, and using eight bottles of the 'Favorite Prescription' and eight of the 'Golden Medical Discovery,' can say my trouble is entirely cured. I would advise any one so afflicted to try these wonderful medicines. My health was never so good as it is now, and I shall never tire of praising Dr. Pierce's medicines."

Sick women are invited to consult Dr. Pierce by letter and secure a specialist's advice *free* of charge.

DRY BRONCHITIS.

From Dr. Hunter's Leetures on the Progress of Medical Scienee in Lung Diseases.

There is another form, called dry bronchitis, in which the matter expectorated is neither profuse nor watery nor purulent. It is a glutinous kind of stuff, of a bluish white or pearly gray color. The chronic inflammation which causes it thickens the mucous membrane, thereby narrowing the tubes through which we breathe, and shortening and oppressing the breath. Often tubes of considerable size become completely clogged by this tough phlegm, causing great difficulty in breathing.

Of all the forms of bronchitis this is the most common. It is the most insidious of lung complaints. Those suffering from it have at first only a slight cough; it may be only a trifling coughing spell in the morning; they have a chilly sensation in the forenoon, and toward evening are feverish.

There is always a feeling of more or less tightness and oppression in the chest, which is relieved from time to time by coughing up a quantity of the tough, jelly-like matter before described. Sometimes the cough comes on in paroxysms, attended by great oppression and distress, like asthma. On inquiry of a person so affected if he has any lung trouble he will almost certainly answer, No, and yet during your conversation will perhaps hack and raise this jelly-like mucus half a dozen times.

Here we have a lung disease which directly tends to consumption, and has most of the symptoms of that disease, and yet is not consumption at all. When it ends fatally, as it often does, an examination of the lungs reveals neither tubercles, ulceration nor the bacilli of tuberculosis.

In such cases death generally results from suffocation caused by a sudden attack of congestion, which, supervening on the chronic disease, fills the lungs with viscid mucus that the patient, in his weakened condition, is unable to raise.

Bronchitis is not generally treated with success, because the proper remedies are not applied to the diseased tubes within the lungs. I had the good fortune some years ago to discover and successfully apply a local treatment for this and other lung complaints. I made the air which the patient breathes the carrier of the remedies which are necessary for his cure. Instead of sending them on a roundabout way through the stomach and general system, I introduce them directly into the air tubes and cells of the lungs, where the disease and all the danger lies, and I know by ample experience that this treatment is the only hope there is for the cure of any form of bronchial or lung diseases.

Readers mentioning THE RURAL NEW-YORKER can obtain Dr. Hunter's book, "The Lungs and Their Diseases," absolutely FREE by addressing Dr. Robert Hunter Association, 117 W. 45th Street, New York City.

SHEEP FOR THE SOUTH.

I have just bought a bunch of common native ewes. Will THE R. N.-Y. give me its opinion as to the best type of ram to grade these sheep up for this latitude? The object is a general-purpose sheep (if this can be attained), viz., a hardy sheep with a good heavy fleece, one that will produce fair to good mutton, and one that will do as well as any other on the range, without too much pampering. The practice here is to drive up in May, mark, castrate and shear, then turn them in the woods till next May; practically without care or attention. I have built pastures and sheds to shelter them in inclement weather, and purpose to breed all about the same time, then take up my ewes before lambing and give them such care as needed. Will you tell me the difference in the three types of Merino, the Delaine, American and Rambouillet? Do you know anything of the Tunis sheep? READER.

Seminole, Ala.

Of the mutton breeds, I do not know of anything better than the Cheviot for these range conditions, where great hardiness and mutton and wool are all wanted. The Cheviot, in his native home, in Scotland, never has any shelter Summer or Winter. He ranges the hillsides and subsists entirely on grass. Down in Alabama, sheep of Cheviot stock should thrive in the woods and pastures, and do well on a minimum of attention, and at no time of the year would require artificial shelter. A friend of the writer handled a flock of Cheviots in Indiana one Winter, and they never saw shelter other than a rather open woods pasture. Yet he tells me he never had sheep do better or remain more healthy. On a ranch in northern Wisconsin, where Lincoln, Shropshire, Tunis, Cheviot, Merino, Hampshire and other breeds have been tried for the past two years, the Cheviots are the most hardy in every sense, stand the Winter best, and have the least sickness.

The three Merino breeds are all hardy and well suited to the range, but they lack mutton quality, and I assume that is what Reader desires. The Rambouillet and Delaine are smooth-bodied types, very much alike, excepting that the former is larger and weighs more. At the Indiana Station we have Rambouillet ewes that weigh as high as 165 pounds, and some Rambouillet rams will weigh 250 or over, though this weight is rare. Both of these breeds produce very fine wool, and the Rambouillet the heaviest mutton of any of the Merino types. The American type has folds in the skin, and is a much smaller breed than the others, and is not to be seriously regarded from the mutton point of view. Just now, of all the Merinos, the Rambouillet seems to be meeting with the most favor, especially on the western range. A first-class Rambouillet ram will shear about 20 pounds of wool, while the ewes will range about 12 pounds. Ordinary stock will shear much less. A superior Cheviot ram will weigh about 225 pounds, and cut 12 to 14 pounds of medium wool, such as will command the highest market price, while the ewes will weigh near 145 pounds, and will shear about seven pounds. The Tunis breed is being recommended by its promoters for its excellent mutton, hardiness and reproductive power. Tunis rams of fair size will weigh about 180 pounds, and the ewes near 135. It is also considered that this breed will do well in the South. It has been bred in South Carolina for nearly a century, but I believe it has never had much of a distribution either north or south. If the flock owned by Reader is sufficiently large, I should recommend buying both a Cheviot ram, and a Tunis, and trying each and doing a bit of experimenting. Such a plan would perhaps be the cheapest in the end. One ram can breed 50 ewes readily, or perhaps 60, so that with a flock of 100 ewes, at least two rams should be used. I might say that for mutton I consider the Cheviot the best of the breeds mentioned, with the Tunis second.

C. S. PLUMB.

SHREDDED CORN FODDER FOR SHEEP

Can you tell us anything about feeding shredded corn fodder to sheep? Will it pay to hire the shredding done rather than to feed fodder in shock? We have quite a quantity of fodder, and have never tried cutting it for sheep. W. W.

Washington, Pa.

Several years ago at the Indiana Station the writer conducted an experiment in which shredded corn stover was fed wether lambs in comparison with clover hay. We had 12 wether lambs, and these were divided into two equal lots. The sheep of both lots were fed whole wheat in equal amounts, and also sugar beets. The experiment lasted 122 days, during which time the lambs were in good health. Those fed the shredded stover, however, did not eat it as economically as was desirable. Although this stover was of good quality, the lambs refused to eat 39 per cent of it, leaving the more pithy and stalky parts in the troughs. The lambs fed clover not only ate more of this roughage, but rejected only nine per cent of it, this representing the coarser, woodier stems. Each lot during the 122 days ate 328¾ pounds of whole wheat and 728 pounds of beets. The cost of the food fed those receiving shredded forage was $5.47, while the ones fed clover consumed food to the value of $11.24. Those fed the shredded stover gained a total of 77½ pounds, while the clover-fed gained 193 pounds. This makes the cost for each pound of gain for the shredded stover lot at seven cents a pound, while the gain of the clover-fed lot cost about 5¾ cents a pound.

One swallow does not make a Summer, and this experiment was not repeated, but I should expect relatively the same results again. The shredded forage is coarser and less easily manipulated in the mouth of the sheep than is the clover. Further, clover is more nutritious. If the stover can be shredded quite fine, much of it, however, will be eaten to advantage by sheep. Personally, however, I should not wish to make the expense of shredding very high. The cost of this rough feed should be kept very low to make it a profitable feed. I have a very high regard for shredded stover, but deem it much better suited to either horses or cattle than to sheep. There certainly will be a great waste in feeding sheep unshredded stover, but as to whether it will pay to shred or not, depends on cost of shredding, size of flock and cheapness of clover or other hay. If I could get it shredded for $1 a ton or less, and had a flock of 100 or more, I should consider it a paying proposition. C. S. PLUMB.

INDIANA FARM HENS.—I give the following as my plan for caring for pullets and hens during Fall and Winter: The hens and pullets get the same care. In the morning they are given a ground mixture consisting of equal parts of corn, oats and bran or shorts, with table scraps, a small amount of animal or beef meal, and a little salt. This mixture is given warm in cold weather. At noon they are fed what wheat they will clean up, with occasional feeds of oats or sunflower seed, and in the evening all the whole corn they will eat. They are allowed to run at large, excepting in severe weather, and are supplied at all times with crushed oyster shells and fresh water; also dust boxes with plenty of road dust when needed. No males are allowed with the flock at any time. Milk is fed to some extent at all times, but at present prices for pork I prefer to feed the bulk of the milk to pigs. This plan is for the ordinary farmer's flock, where the bulk of the feed can be produced on the farm. W. H. I.

Etna Green, Ind.

Horse Diseases in Cuba.

The annual report of Gen. Wood, Military Governor of Cuba, refers to peculiar influences affecting horses in Cuba. It seems that the number of horses condemned and eliminated from the service in Cuba averages higher than under similar conditions of service in the United States; but the great majority of condemnations result from blindness. There is an eye disease prevalent in the American horse in Cuba, the cause of which has not yet been satisfactorily explained by the veterinarians. The disease seems first to attack one eye, which gradually becomes covered with a cataract or film, destroying the sight thereof, after which the other eye becomes sympathetic and follows the same course, when the animal becomes totally blind. It was at first thought that the glare and heat of a tropical sun had somewhat to do with the trouble, but so much care has been exercised to protect the animals from the sun's rays when not in use, that the veterinarians have about given up that theory, and several of them are now of the impression that it is a predisposition resulting from indiscriminate breeding of the horses in the United States just a few years prior to the Spanish-American war. Another disease that is more or less severe on the American horse in Cuba is lockjaw. This malady has been successfully treated by the veterinarians of the Seventh Cavalry, but the eye trouble still baffles the veterinarians. There is some recompense to the Government for the severe losses by these diseases, in the fact that the animals sell in some instances for the full value of their first cost to the Government, and very frequently a horse that would not bring $10 in the States will sell in Cuba for $50, $60 or even $70. It is the same way with mules, and buyers will frequently pay $100 for a mule that would not sell for $20 in the States.

MARKET GARDEN HENS.—To tell the honest truth I do not take care of the hens. They have to look out for themselves. The Madame does not take to chickens, and the children take after her. Hens are a nuisance on a garden farm, and my method is the future will be to sell in the Spring and buy in Autumn for Winter's supply of eggs. U. D.

THE chickens which are hatched out in July or August are the best for laying purposes, and those which are hatched out later should be used for market this Winter. These chickens should be kept in a warm coop and they will do much better for laying. They should be fed on corn through the Winter and house scraps. Once a month they ought to get red pepper with bran and salt, and also break them up some china ware; it does them good for laying. Chickens hatched later in the season would pay well in the Spring for market if kept in a very warm place over Winter. After chickens are once past three years of age it doesn't pay to keep them any longer for laying. A. L.

DAIRY AND FARM NOTES.

The Breeds of Dairy Cattle.

WHAT COW?—"What are the best breeds of dairy cattle? What stock will make the most profit? Would you advise me to breed Jerseys, or Holsteins, or Ayrshires?" These are questions asked at institutes and in the press. No one can definitely answer them, and yet they will not down. If it is impossible to place one breed at the head, why come these questions? Butter fat determines the value of milk; that is, its true value. People who have any thought upon the subject know it, and creameries quite generally credit the farmer upon that basis. Butter fat also determines the cheese-making power of milk with equal certainty. Just why farmers in New York are so slow to accept it, I am not able to state. After a long experience in testing milk, I am quite in the dark just why farmers should in cheese sections so persistently fight the only true measure of milk value. In the milk-selling districts the explanation is easy. Milk containing 3.4 to four per cent of fat, and about 12.5 per cent total solids is satisfactory, or, rather, a milk containing more solids will bring no more. The farmer, therefore, is justified in producing only a so-called average milk. Any test of cows bearing directly upon the fat content does not fully satisfy him. It may be unfortunate that such a condition exists, but it does. The question resolves itself with these farmers to the greatest flow for least cost, provided always that the milk has an acceptable amount of solids. These people have no use for the Channel Islands cow, although she may as a breed produce butter fat cheaper than others; not only butter fat, but milk solids. I am inclined to think that the breeders of Holsteins, Ayrshires and Short-horns, have overestimated the value of their skim-milk in instances where the rich milk producer has excelled them in cost of producing a pound of fat.

SKIM-MILK VALUES.—The claim was at once made that the extra skim-milk more than balanced the loss. Let us see about it; 100 pounds of Holstein 3½ per cent milk will give us remaining after accounting for all losses about 95 pounds of skim-milk. Assuming nine pounds of solids, not fat, to the 100 pounds, this 95 pounds would contain 8.64 pounds of solids. Valuing the skim-milk at 15 cents per 100 pounds, and figured upon a basis of actual solids contained, this would give us 14¼ cents for the skim-milk resulting from 100 pounds of milk, or for 8.64 solids, not fat, one pound of solids would therefore be worth 1.64 cent. Let us turn this same valuation over to the Jersey milk, with five per cent fat. In order to obtain 3½ pounds of fat from the latter milk, 70 pounds only would be required, leaving, say, 64 pounds skim-milk. The five per cent milk will contain net in solids, not fats, slightly more than the Holstein milk, about one pound to the 100 of milk. Figuring on the 64 pounds, we have 6.40 pounds of solids, not fat; at 1.64 cent per pound, we have a net value of 10.49 cents. The difference between 14.25 cents value of Holstein skim-milk and the 10.49 from Jersey skim-milk, gives a difference of 3.76 cents, quite insignificant when compared to first and full valuation of milk, or where any material increase is found in producing fat in the low-grade milk. I do not think we are justified in placing too much stress upon the skim-milk value of the large milk producers over the smaller and richer milkers.

THE BIG COWS.—There seems to me a place for the Holstein cow. Although my experience warrants the general conclusion that they are large consumers, they are at the same time very strong, hardy animals. Especially is this true of the young. The strong, robust constitution gives them a place in our American dairying in a way not filled by any other breed, the Ayrshires most closely approximating. It is a principle in the breeding which I think has been pretty well established, that the top cross should always have plenty of vital force and energy; in other words, if a weakness prevails, be sure that it does not appear in the sire. The Holstein, with its vigor, makes a valuable purebred for crossing upon native and mixed breeds, such as we find scattered in every dairy section. In all sections where milk is sold, or under any or all conditions where the skim-milk is not returned to the farm, the raising of the young is a problem not cheaply solved. So many writers and speakers repeatedly affirm: "Make butter; do not sell milk or make cheese." Yes; that sounds well enough on paper; but, see here, people must have a half-pint of milk per day per capita, and if they would double the amount household economics would be better satisfied, digestion improved, and our dairy interests advanced.

MORE CHEESE.—While we are not a cheese-consuming people, like the English, with their 18 pounds per capita, or the French, with eight pounds, we still must have 250,000,000 pounds annually, or 3½ pounds per capita, and when we come to produce only a fancy full cream product, cured at low temperatures, soft, silky, clean-flavored, and put up neatly, the Americans will double their present paltry consumption. In fact, we are increasing steadily our demand for special milk products, which does not permit the possibility of skim-milk return. From every indication our per capita consumption of butter will not materially increase for a few years at least. We must expect the greatest increase from the consumption of crude milk, cream, and special milk products, condensed milk, soft cheeses, etc. If this statement is true, the larger Holsteins, Ayrshires, milking strains of Short-horns, and we may add Red Polls, if the breeders can produce the type shown in the Model Dairy at Buffalo, have a place in our dairy breeding economics, which the Channel Islands cows cannot fill; from the fact that the young can be more easily reared upon skim-milk substitutes.

YOUNG STOCK.—To be sure new milk, fresh milk, can be given for four weeks, but most dairy farmers do not feel that they can raise calves upon such expensive foods. Let me say here, that a calf that is not worth two or three quarts of new milk daily for two weeks after birth is not worth raising, and upon these vigorous young things a daily ration as mentioned above, supplemented with whey when at hand, or a boiled mixture of oats, corn and linseed meal, in a proportion of 3—3—1, will make a growth. While not as satisfactory as one would wish when milk is at hand, a growth will follow which will produce a medium-sized animal at two years, ready to take a place in the dairy. It may not be out of place here to say that most failures in growing stock come from an occasional period of fasting or check in growth. The satisfactory young animal, as produced upon our business dairy farms, is the one that does not stop growing until maturity is reached, which is usually not much before five years. In my experience, animals that have grown rapidly, and then from a lack of proper food have halted in their development, are not as profitable as those more slowly grown, but evenly and uniformly developed from birth.

H. E. COOK.

NOVA SCOTIA HENS.—I feed my hens and pullets mostly on grain—oats in the morning and buckwheat at night. I only feed twice a day, morning and night, with scraps from the table at noon; give them milk and buttermilk when I can—with plenty of oyster shells ground; fresh meat twice a week. W. F. N.

SHEEP prospects on Spring lambs never were brighter with me. We have about 40 half-blood Tunis lambs now, and prospects point to many more soon. I had two half-blood twin lambs that I showed at the Pan-American with the Tunis flock; they drew well. At the "Streets of Cairo" at the Exposition they have a sacred or fat-tail sheep and she is almost like the one I have. C. ALLIS.

AN HONEST HEN MAN.—A reader in Illinois asked to give his experience with hens writes as follows: "My experience handling old hens and pullets would be of no value to the readers of THE R. N.-Y. Mine are cared for on the hit-and-miss plan; if they do well it's a hit. From what I am about to relate you will see that I am constrained to be truthful in this matter. Away back in the sixties a contributor of THE R. N.-Y., who lived in this town, wrote such fascinating descriptions of how to manage a farm that the editor, who was passing through, concluded to stop and visit his place. The first thing he saw was a wagon that closed the opening where the gate should be. In pursuing his investigations he found that the mules had kicked out the back of the barn, and that their hind feet were on a manure pile higher than their heads. This story is still going the rounds, and warns one not to pass off fiction for truth."

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

WORK OF THE
DE LAVAL MACHINES
— AT THE —
BUFFALO EXPOSITION.

The award of the GOLD MEDAL to the De Laval Cream Separators (the highest and only award of its kind) at the Buffalo Exposition, was well supported by the magnificent work of the De Laval machine used in the Model Dairy of the Exposition, which made a record in practical work, under ordinary every-day use conditions, in every way unapproachable by any other than an improved "Alpha-Disc" De Laval machine.

PAN-AMERICAN EXPOSITION, 1901.

[COPY] BUFFALO, N. Y., Oct. 21st, 1901.

THE DE LAVAL SEPARATOR CO.,
74 Cortlandt St., New York.

GENTLEMEN:

The work of the De Laval Centrifugal Cream Separator, Dairy Turbine size, guaranteed capacity 1,000 pounds per hour, used by us in the Model Dairy at the Pan-American Exposition, Buffalo, N. Y., brought out the following points;

First: The machine has been run from August 9th, 1901, to September 28th by the buttermaker and his assistant, and had no special attention given it by any expert of the Company.

Second: The official tests were made by two of the best experts in Babcock testing, and for the whole time, or 71 consecutive tests, shows a loss of .0161 of one per cent. of butter-fat.

Third: It was run at its full guaranteed capacity of 1,000 pounds per hour, at times exceeding that amount, but at no time was the feed reduced to make a skimming record.

Fourth: The amount of power used was very small.

Fifth: It did what you claimed for it in every particular.

EDWARD VAN ALSTYNE, *Supt.*
DE WITT GOODRICH, } *In charge of tests.*
JAS. STONEHOUSE, }
JNO. A. ENNIS, *Buttermaker.*
ELMER C. WELDEN, *Asst. Buttermaker.*

OTHER GREAT EXPOSITIONS.

The supremacy of the De Laval machines at Buffalo is a continuation of their triumphant record at all previous great expositions. At the World's Fair, Chicago, in 1893, they received the Gold and only medal awarded by the regular jury of awards and were the only separators used in the Model Dairy. At Antwerp in 1894 and at Brussels in 1897 they received the Grand Prizes or highest awards. At Omaha in 1898 they received the Gold Medal, and again at Paris in 1900 the Grand Prize or highest award.

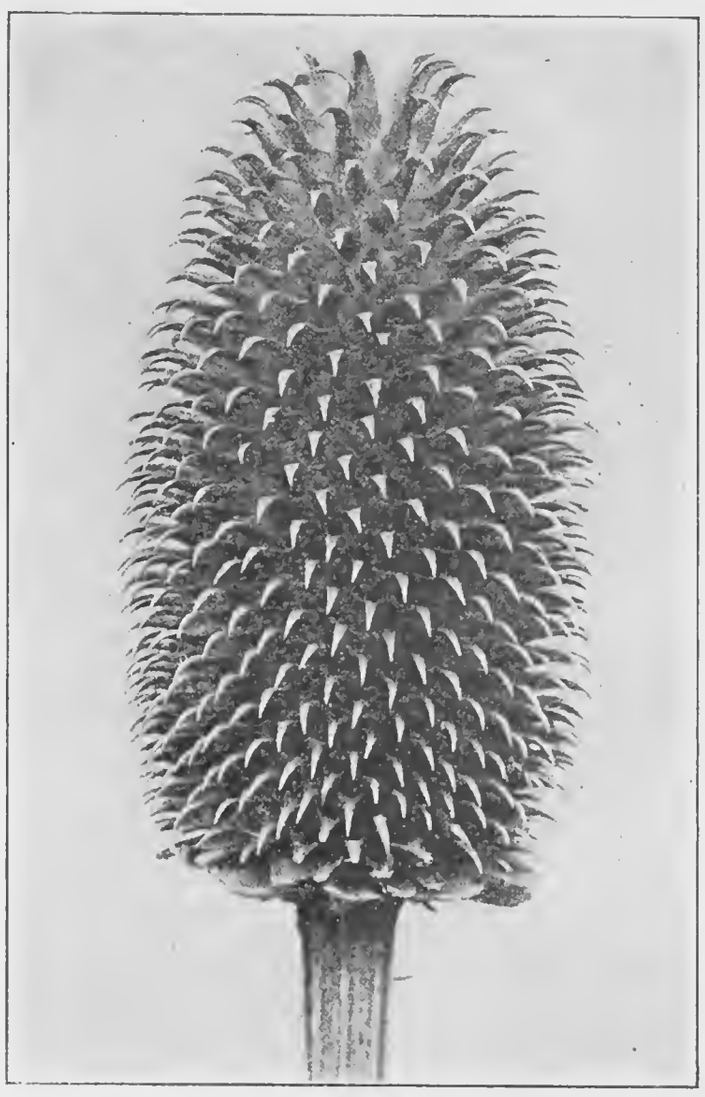
THE CULTIVATION OF THE TEASEL.

A PROFITABLE LOCAL INDUSTRY.

All About the Culture.

HOW TEASELS ARE USED.—Near Skaneateles, Onondaga Co., N. Y., there has grown up an industry which is unique in many respects. While there are other sections of the country in which teasels are grown, yet the German and English manufacturers of woolen goods pronounce the teasel which is grown near Skaneateles to be the best grown anywhere. There seem to be some peculiar conditions of soil and climate which make this teasel tough and elastic, qualities which are of great importance when the teasel is used in the mill. Before proceeding to discuss the cultivation of teasels it may be well to explain what use is made of them after they are grown. In the manufacture of woolen goods it is the custom to produce what is known as the "nap." This is the slight roughening of the fibers which gives to the goods the fuzzy appearance so prized in woolen fabrics. To produce this slight roughening there has been nothing found yet so well adapted to the purpose as the teasel point. Efforts have been made to manufacture steel points which would displace the teasel, and while for the coarser grades of goods a steel point is now used, yet for all the finer fabrics the teasel point has not been displaced. The teasel heads are fastened to cylinders, and then over the rapidly revolving cylinders the woolen goods are passed. The tip of the teasel point is allowed merely to touch the goods, and thus is produced the roughened appearance. It is found that the point of steel cannot be made perfectly smooth, while the teasel point, even under the highest magnifying power, is entirely smooth. If a fine cambric needle is examined under the microscope it will be found rough and jagged in comparison with the teasel point. Fig. 347 shows a teasel head trimmed for use, enlarged. The market for teasels seems at the present time to be a permanent one. Many tons are exported each year to England and Germany, and they are used in the manufacture of the finer grades of woolen cloth. American manufacturers are using large quantities of steel points, but only in the manufacture of the coarser goods.

QUALITY AND CLIMATE.—Just why Skaneateles has come to be a center for teasel growing is unknown, but it is found from actual experience that in a section of about 10 miles square a fine quality of teasel can be raised, and in sections outside of this area the teasel which is produced is almost worthless. The qualities which make the teasel valuable are extreme toughness and elasticity; consequently a moist climate is necessary, and it is found that the teasel, when grown in an extremely dry year, is not of as good quality as when grown in a damp season. At present two varieties or species of teasel are grown, one known as the Oregon teasel and the other as the Skaneateles teasel. The latter is a large, coarse teasel, while the Oregon variety is small, with finer points. It is found that the Oregon teasel, when grown at Skaneateles, produces a product which in the English market is worth 50 per cent more than the same variety of teasel when grown in Oregon. This is due to the fact that a certain degree of elasticity and toughness is imparted to it which it does not receive in the dry climate of Oregon. Four years ago the market demanded a large teasel, but at the present time double the price will be paid for a teasel not more than 1½ inch in length than will be paid for one two inches or more in length. Four years ago the reverse was true. At the present time the German manufacturers of fine goods will not purchase a teasel more than two inches long, and they prefer 1½ inch. The wild teasel is more or less familiar to all. In its general appearance the plant is not very different from the cultivated



HEAD OF TEASEL (ENLARGED.) FIG. 347.

teasel. The wild teasel, however, is lacking in the rigid point which makes the teasel of commerce valuable. Fig. 349 shows mature wild teasel plant at left, and cultivated teasel at end of first season's growth at right.

SCENE IN A FIELD OF CULTIVATED TEASELS. FIG. 348.

SOIL AND CULTURE.—The soil upon which teasels are grown should be a heavy clay or clay loam, and well drained. The more thorough the preparation the better. It is found that the manure would better be applied to the crop which precedes the teasels, and that teasels do better when following a crop of corn or beans rather than following a grass crop. The effort is made to give the ground clean intensive culture the season previous to growing the teasels that all weeds may be destroyed. In early Spring the land is plowed, and it is even better if it can be plowed in the Fall, and after thorough harrowing some time during April or in early May the teasel seeds are planted. Rows are marked off three feet apart, and the teasel seed is drilled thickly in the row in order to secure a stand. They are covered lightly, about as lettuce seed would be covered. After the plants are well up they should be, but are not always, thinned out to distances of about one foot in the row. This is not always done in practice, yet it is conceded by growers that a better product would be produced if it were done. In the rows with the teasels corn is planted, the hills of corn being from five to six feet apart. This corn is planted, not for the purpose of producing a crop of corn, but for the influence of the corn stubble in holding the snow during the Winter. Fig. 348, a teasel field in October, shows the topped corn and the teasel plants.

SECOND-YEAR TREATMENT.—The teasel is a biennial, and occupies the land for two seasons. The first season the plants attain a growth of from 15 to 18 inches, but during the Winter they hug the ground closely and it is important that they be covered with snow, otherwise they may winterkill. The corn, which is simply topped, causes the snow to lodge, and thus protect the teasel plants. In the Spring of the second year cultivation begins early, and is continued until about June 1, at which time the teasel plants so branch out that it is impossible to continue tillage. From the middle of July to the first of August is the harvest season. The head on the central axis is harvested first, and then the tops from the branches are cut as they reach maturity, several cuttings being necessary. About three inches of the stem is cut off with the top, and the remainder of the teasel stalk is either plowed under or burned (usually burned) upon the land where grown. The tops are placed in baskets and carried to scaffolds or drying frames, and for two or three weeks are permitted to dry. A teasel-drying house need not necessarily be different from a tobacco-drying house. Free circulation of air is the important requisite. After drying they are sold by the farmer to the dealer. The price secured by the farmer varies with the season and with the demand. During the past season it has been about 10 cents per pound. It is said by the dealers that after purchasing teasels from the farmers the shrinkage is about one-fifth in weight. The dealer trims the tops and packs them according to size, in large shipping boxes. The work of packing must be very carefully done, as the teasel tops must not vary more than one-fourth inch in length or diameter. The shipping boxes, weighing from 400 to 600 pounds each, are then sent to the woolen manufacturer either in this country or abroad. The price received by the dealer during the past season was about 17 cents per pound. One firm in Germany would purchase all the teasels grown in Skaneateles of the proper size if they could be purchased. The amount raised upon one acre in a good season is about 1,500 pounds, this amount, of course, varying with the season. Inasmuch as two seasons are required in which to produce the crop, the profit is probably no more than from many other farm crops.

A CONDENSED INDUSTRY.—In England and Germany, where teasels are grown, the plants are started in beds much as tobacco plants are started in this country. In the Fall of the first season the plants are taken from the bed and set in the field, thus enabling the farmer to secure his teasel crop by using the land only one season. One of the best crops with which to follow teasels is wheat. The teasels come from the land at just the proper time to enable it to be fitted for Winter wheat. Up to the present time no insects or fungous enemies have appeared to produce serious damage to the crop. Recently there has been an attack by what is evidently a fungous disease which causes the stalks to weaken and droop shortly before the plants reach maturity. This trouble is at present being investigated by the Department of Agriculture at Washington, and without doubt some remedy will be found. The teasel industry was started in Skaneateles in 1832 by John Snook, who brought seed with him from England. The Oregon teasel industry was introduced into Oregon by an Englishman, Mr. Sautell, who brought seed from Belgium. Owing to the limited area on which teasels can be grown successfully there is not much danger of the market being over-supplied. They cannot be stored for an indefinite length of time, for with age they become brittle and break easily. No investigations seem to have been made, up to the present time, as to proper methods of fertilization and amount of plant food removed from the soil by teasels. These investigations will shortly be undertaken, and it is hoped that soon definite information may be secured as to the effect of the growth of teasels upon the soil, and also soil and climatic conditions which produce the valuable qualities in teasels. L. A. CLINTON.

COW PEAS AT THE NORTH.

A Good Start in Pennsylvania.

As I had never seen any cow peas growing I concluded to try an acre of them. I planted them June 15, in rows three feet apart; dropped them by hand and covered them by putting shovels on the cultivator. Just before they came up I ran over them with weeder; cultivated three times, once in a row each time. The ground on which they were planted was heavy clay, with no humus in the soil. Heavy cold rains about September 1 turned vines very yellow. About September 20 they were frosted. They matured some ripe pods. I plowed them under October 10, and sowed the piece to rye. The ground on which the peas were planted was so poor that I cannot remember the time when the mowing machine was run over it. It has been the custom to plow it, raise a crop of buckwheat, then a crop of oats or rye; try to seed it with sweepings of barn floor, let it rest a few years, then give it another dose of the same, until it got barren of all vegetation except five-finger and silver grass. I measured some of the vines that were eight feet six inches high. These grew on a part of the field that was made rich by the sheep lying in the shade of an apple tree. I removed the tree with dynamite, but the growth on the whole field was about all that could be plowed in. The ground was filled with nitrogen nodules, or at least the roots were covered with them. The cow peas were an early black-seeded variety. If this experiment plot proves a success I shall use the same means on the rest of the poor land. It is 12 years since I bought this place; it was then in a worn-out condition, or at least in a bad chemical condition. How to pay for it, build new buildings and rebuild the old ones, keep the pot poiling and raise three healthy children was a very serious question to me, but for me to tell the rest would take too much space, so will close. G. B.

Factoryville, Pa.

R. N.-Y.—You close just at the wrong point, for we all want to know how you mastered these hard problems. We feel sure that the cow peas will help.

A Good Account from Massachusetts.

On June 18 we planted a bushel of Black-eyed cow peas alone, in drills, on an acre of land. They had hardly begun to blossom the last of August when they were cut for hay. They made a tremendous growth, and completely covered the ground. We consider them a success, although they were hard to cut and hard to cure. Another year we shall try for an earlier variety. We have not begun to feed the hay yet, but we fed some of the vines green, and the cows were extremely fond of them. Our making the crop into hay was a case of necessity. We need the cured fodder very badly. If the long, wet Spring had not made it impossible we should have put oats and Canada peas on that piece. We would have liked to put more of the crop under ground than just the roots and stubble, but we wanted the rest to feed. I think there is a way to "have your cake and eat it, too." After the piece was cut over, and before the hay was cured, the stubble sprouted enough so that the rows showed plainly. My idea is this: Plant the peas as soon as the ground is warm, and cut to feed green, so that all will be cut by the first part of "dog days." This would be the most favorable time for the stubble to sprout, and, judging by the way ours started, there would be a good second growth by the time frost came. This could be plowed in, or left on the ground for a cover crop. S. B. ROBBINS.

Massachusetts.

They Show Up in New York.

My cow peas were sown June 22 (a black-seeded variety) 28 inches apart and cultivated twice; 100 pounds of phosphoric acid and potash per acre and one bushel of beans. The growth was very large, completely covering the ground 1½ to two feet deep. I tried to cure some of them, but the wet season had induced a watery growth and with a cool, moist Fall they did not cure well. On October 8 they were still green, not killed by frost, and had only produced a few blossoms, no pods. I think they were a late variety. I began on the above date to plow them under. Well, I thought myself an expert at turning under green crops, but those cow peas were a sticker. The vines reached across two rows, some of them four to five feet, and well tangled. I used a large swivel steel plow with heavy chain, but they clogged so badly I could not get them under until I used a harrow to turn them around in line with the furrow; then they went well out of sight in the bottom of a nine-inch furrow. The plow was followed by roller, then well harrowed and sown to rye, two bushels per acre, with 100 pounds more fertilizer, to be turned under next May and planted to beans. While plowing one thing was brought forcibly to my mind. The land where the cow peas grew was very loose and lively,

THE WILD AND CULTIVATED TEASEL. Fig. 349.

in splendid mechanical condition, while land alongside, in same lot, treated the same heretofore, but planted to field beans, was so hard that I could hardly plow it. This is my first experience; its teachings are that they are poor to feed to cows or swine (as mine failed to relish them), but I believe the key to success on these old run-down clay loams is to furnish more humus, and the past season's trial tells me that cow peas are the best crop I have ever used for that purpose. W. L. M.

Searsburg, N. Y.

SOME REASONS FOR BREEDING PONIES.

Danger Before the Carriage-Bred Colts.

It pays to raise well-bred driving horses. That is, if you can. But there are several things in favor of raising ponies. One of these is that they are not nearly so liable to get injured; being of a very quiet disposition, they will run by a barbed wire fence all Summer, when it would be impossible for a trotting-bred colt to run there without his getting more or less cut. Then the cost of feed is very small. Indeed, one of the drawbacks of breeding the ponies is that the little mares get so fat that they are liable not to breed. We have just been having a serious time with our colts, as they have had an attack of distemper or strangles. The baby pony had it very badly indeed, and it was only by the greatest care that we saved his life. Here was another case where his diminutive size was of value. When he got so bad that it was only with the greatest difficulty that he could breathe, I just picked him up and carried him into the kitchen, where Mrs. Morse and I poulticed his throat with flaxseed meal, and steamed him by placing his head in a grain bag partly filled with fine hay and sprinkled with pine tar, and then saturated with boiling water. He is now probably out of danger, but he is much lighter than before. That distemper can take the flesh off a colt in a surprising manner. But his being a pony, it does not do any hurt if he does not grow very fast. This distemper will only help to make him a diminutive little prize pony, another point in the pony's favor, for the carriage-bred colt needs to be kept growing, and this distemper has left her looking as if walking on stilts, her legs are so long.

Speaking of carriage-bred horses there is no danger of their becoming too plentiful, because there is nothing to breed them from. If a farmer raises (by chance) a fine carriage mare, off she goes to the city, and only the runts and "beef" mares are left to breed from. Two years ago I was able to get a Hambletonion mare six years old, standing 16 hands tall, and weighing about 1,150 pounds. She was of a very nervous disposition. In fact, she had run away and scattered a wagon shortly before I got her. I thought she would make an excellent breeder, if I could find a suitable horse to mate her with. By careful handling she, with her mate, will plow two acres of sod in a day, but she will go up in the air if she is "fooled" with. This is a serious drawback to using this class of horses on the farm. On the road they will draw a wagon 10 miles in an hour, up hill and down. Still, neither is a "salable" horse. I bred this mare to Harry Eddy, a standard-bred horse with a race record of 2.26¼. He is a blood bay, 16 hands high and weighing 1,100 pounds. This horse is having a remarkable run of popularity just now, having served 100 mares the past season, and these mares are big mares and little mares, draft mares and mustangs; any old mare that perchance may raise a "Harry Eddy" colt. And what a lot of disappointed men there will be when these colts grow up, and they find that their "Harry Eddy" colt looks so very much like their little old Dolly, whose neck grew bottom side up, and whose legs were made for a Jersey heifer, but by mistake got attached to a horse!

My mare dropped a blood bay colt on April 5, long of leg and long of neck, filled to the brim with "ginger," because both the sire and dam were of these characteristics, not because one of them was and the other with faults enough to ruin a dozen colts. The colt was kept in a box stall, and the mare was taken to the barn to nurse her once during the forenoon and again in the afternoon. We could not let the colt run in the lot while working the mare, because the thing was too crazy to stay within a quarter of a mile of her mother, and the mother was inclined to go crazy with the colt. Yet she would work very well until the time came to go to the barn, then the best thing to do was to unhitch and go. After haying I turned the mare and colt into a meadow, where one side was fenced with wire, on the back side of the lot, next to the woods where no stock were. But in a few days the colt came down with an ugly tear in one hip, which took several stitches and much liniment to mend, and since this time they have had to be contented with the "calf pasture," which is fenced with boards. Then came the distemper, through which she has barely lived, and she is less than seven months old. A long time yet before she will be a five-year-old "market" horse, and I am beginning to think that when a man produces one he earns his money, to say nothing of the fact that it is more than half just "luck." J. GRANT MORSE.

BIRDS THAT BOTHER FRUIT.

How can I prevent my apples being eaten by birds? There are a number of them here that belong to the Apple Consumers' League, mostly the woodpecker, of which there are four species. Jays sometimes think their systems need toning up by a diet of apple, and take a hand in the work of destruction. I have in former years shot large numbers of the black and white woodpeckers, as they are the worst of all, but their ranks were immediately filled up, and the work went on. They begin each year on the early varieties, Sweet Bough if they can find any. I cut my Bough trees down, thinking that would stop them, but they would turn to next in season, Early Harvest, Red Astrachan, Maiden Blush, Nonsuch and also peck and spoil Winter kinds, Wagener, Willow Twig, etc. We have been familiar with the fruit conditions in this section for 35 years and have not known birds to injure apples until about eight years ago. It is not for the want of food that they do so, as the crop of worms and other insects, except Potato bugs, gets larger every year. We also lose from one-third to one-half of our cherry crop by the same crowd, assisted by robins and catbirds; also lose a large share of the berry crop except strawberries, by the same gang. Is there any remedy for this state of affairs? H. S. M.

Canton, Ill.

R. N.-Y.—We call for information from those who have had similar trouble. What can we put in the apple sauce that will cure this bad habit? Membership in the Apple Consumers' League is confined to humans.

A PROBLEM IN HOUSE DRAINAGE.

Having had the same problem of house drainage as that stated in Hope Farm Notes October 12, I give you my experience. My house stands about 80 feet from road; soil a clay loam underlaid with shaly limestone at two to three feet depth; road about 15 feet below level of house. Having plenty of room at side of house I carried the drain 80 feet west (house faces south) properly trapping and ventilating at house. I dug a square cesspool five feet deep, walled and cemented it, divided it in center with plank wall and placed therein a panel of wire cloth; one-quarter-inch mesh, heavy galvanized wire. This acts as a strainer. Beyond the strainer a tile drain leads the water into a blind ditch of stones, covered with earth. The cesspool is covered with plank. There is a manhole in this covering, on the house side of the strainer, and through this the contents of cesspool are removed. We have a bathroom and closet draining into this cesspool, and for four months in Summer have 20 to 30 people in the house. The cesspool has been emptied but once a year. The water seeps away into the thin soil, making the grass green over a wide space. The system proves efficient and inoffensive. I do not consider it complete, for the waste of valuable fertilizing material is great. I intend to dig a ditch about 100 feet long, fill with stone to within 1½ to two feet of surface, fill in with earth and plant grape vines along side, and will conduct the liquid drainage into this ditch for a permanent outlet. My house, drained as above, you illustrated in THE R. N.-Y. as the "first premium" farmhouse two or three years ago.

New York. W. B. CLEVES.

CANADA AND COW PEA HAY.

A word about haying cow peas. I tried it on a small scale, cutting the hay in a cutting box, mixing with mill feed, scalding and letting steam several hours. This makes a good feed, especially if pods are allowed to form before haying. But I imagine cows must be very hungry to eat the hard, coarse, dry stems. For hay I much prefer sowing Canada field peas and oats—both hardy—early in April here, more than a month earlier than it is safe to sow cow peas; cut in June and cure. This hay will be eaten more readily than that of cow peas. Then there is still time to sow cow peas, even though it were as late as July 5, and by the middle or latter part of September have a good crop of green feed. Thus I get two crops instead of one, and the soil is none the worse for it. The ground can now be plowed for the third time for that season and sown to rye, and it will be in good condition for corn next season. If I can manure it, so much the better. By the way, I have seen the statement that manure has very little effect on cow peas, which does not accord with my experience. On soil of ordinary fertility they make a good growth. They will also grow on soil too poor to grow any other useful crop, and where clover is not to be thought of, but on such soil it will well pay to manure them. The fact that they grow on poor soil, and improve it, renders them especially valuable. H.

South Hadley, Mass.

R. N.-Y.—Manure will benefit any crop, but we sometimes have so little of it that it is better to put a fair dressing on part of the crops and let the cow peas alone.

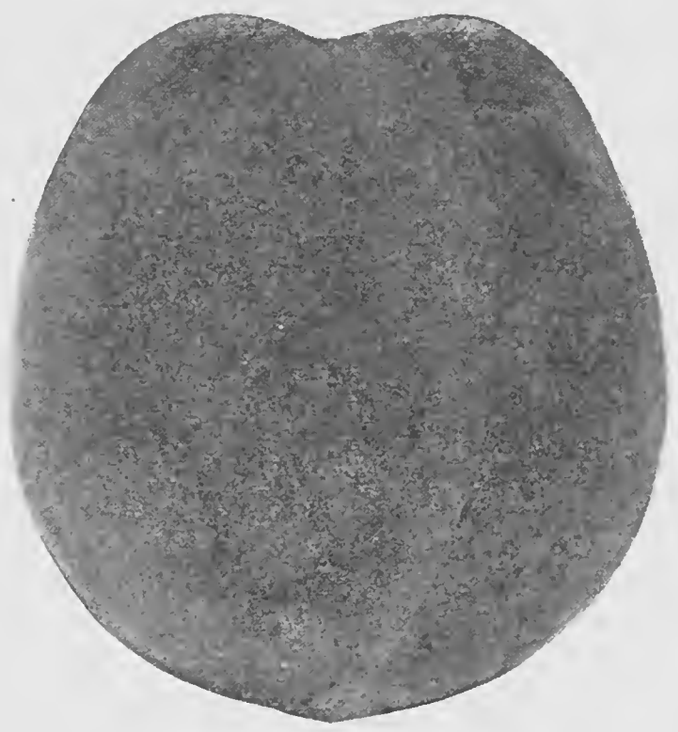
CREAM SEPARATOR FACTS WANTED.

Prof. I. P. Roberts, of Cornell, in one of his answers within a year or so, in speaking of so-called water separators, speaks of the method of water separation as of doubtful utility. "Doubtful utility" used in this connection seems to be just a guess based on general knowledge rather than on "I know." Prof. Roberts has no heartier admirer in his bailiwick than "yours truly," and so I write you to induce him to say "I know," for I have tried certain experiments to find out. Seven years ago I commenced here, and the first year used small pans. Two four-year-olds, one three and one two-year-old made up my dairy. The sum total of butter was 620 pounds and some ounces, or an average of 155. The next year I used water in an open can—sometimes a tin butter tub—skimming crudely yet carefully from the top; the same cows, one year older, and a two-year-old. The result was 947, or 189.4 per cow, with the same feed, no grain of any sort being fed. The next year an average of 204.7. I now possess a so-called separator, and use it Sundays, as I send milk to a cheese factory during the week. I have always ascribed the increase in butter to the water separation, and if it be of "doubtful utility" I want to know why.

I wish you to induce Geneva and State College to unite with Prof. Roberts in making an experiment like this: Use 400 pounds of milk, all mixed together. First, water 110 pounds, milk 100 in water separator. Second: 100 pounds milk run through a standard separator. Third: 100 pounds milk in Cooley-Stoddard or any standard creamer. Fourth: 100 pounds milk set in small pans. Fifth: After milk has been watered in No. 1, wait four hours or more, and then very slowly draw off about 100 pounds of milk and water, warm it and run the product through a De Laval, United States or other separator, and see how much butter can be extracted therefrom. Then, when these results are tabulated, we shall know *why*. Meantime, I will read and love THE R. N.-Y., water the milk and wonder whether I'm an old stupid or *why* watering is of "doubtful utility." E. D. R.

Pennsylvania.

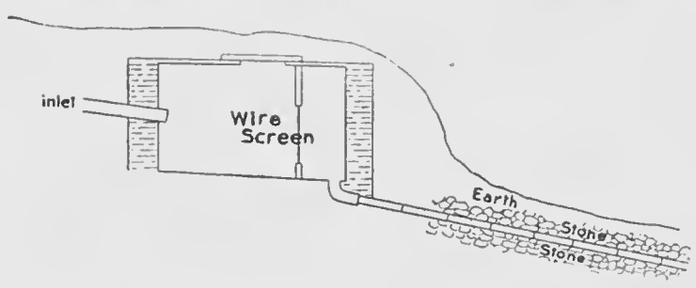
R. N.-Y.—The directors of the experiment stations at Cornell and Geneva, as well as the Vermont Station, tell us that they consider this question has been fully settled. At the Vermont Station the centrifugal separator did extract some cream from the diluted



NEW HARDY PEACH, WELLINGTON. FIG. 350.
See Ruralisms, Page 774.

skim-milk. A bulletin from Cornell, No. 151, gives the full history of very complete experiments in which large quantities of fat were found in every sample of skim-milk taken from one of these dilution separators. H. E. Cook sums the matter up as follows:

"I consider the 'dilution' system something of a humbug. It possesses no merit above the cold setting, and has many disadvantages, the chief of which is nearly spoiling the skim-milk by making it so thin. Cornell made under Prof. Wing most elaborate experiments, and if the writer will send for their bulletin he will be satisfied that they 'know,' and did not guess. I have tested skim-milk from this system that contained over two per cent fat. I have not tested any that had less than .4 of one per cent. The reason I call it a humbug is because several cans were on the market advertised to possess some mysterious power of getting the cream all out, and were called separators, a name which cannot be applied to them as we understand and accept the term. A separator gets the fat all out. These things do not. A Babcock test usually takes the conceit all out of this system. I would suggest to E. D. R. that he put his skim-milk through a test and see how much is left. The centrifugal separator is the only means to-day of getting clean skimming, and all other systems have more or less loss. The so-called Cooley system, or to simplify, a can about six inches in diameter placed in ice



A PROBLEM OF HOUSE DRAINAGE. FIG. 351.

water, is next best, and with Jersey or Guernsey milk properly attended to will give very good results. But please do not buy these so-called dilution separators."

CLOTH IN PLACE OF PLASTERING.

In a copy of your paper a few months ago there was an article on building a small tenant house. The writer alluded to using cloth instead of plaster. Would you tell me what kind of cloth was used, and whether pasted on or nailed? E. H. M.

Grant Park, Ill.

Last May, on page 323, I gave a description of a small tenant house I had recently built, at small cost, and which has proved very satisfactory. The house in question is finished inside with cloth instead of plaster. We used unbleached sheeting, which cost 4½ cents per yard. Some use cheesecloth, but I do not think it strong enough. The cloth should be firm enough to bear hard stretching. It is tacked on with tacks that come for the purpose. They are a little smaller than carpet tacks, and the heads are thinner and flatten down to the goods, holding it firmly. The cloth should be put on before the casings; and for walls eight feet high 2½ breadths of yard-wide sheeting are required. This leaves six inches for base. The breadths should be sewn together on the sewing machine and then rolled upon a board with the seams out. The board should be a trifle shorter than the walls are high, and the first end of the cloth should be securely tacked to it. Now, beginning at a window or door, stand the board up, and begin rolling off the cloth and tacking the upper edge until you come to a corner. Have ready a piece of cove molding as long as the cloth is wide and, making the threads of the cloth come straight down the corner, press the molding into the corner, and nail with small finishing nails. This holds the cloth firmly and makes the work easy. Now continue to stretch and tack the cloth into place. The spaces above windows and doors are filled in with pieces.

For the ceiling, make the cloth a few inches larger than the room; sewing together, same as for the walls. This also is put on with cove molding. Cut four pieces as long as the walls of the room, and drive nails about 10 inches apart the entire length of each. The nails should pass through the molding, about a quarter of an inch. Now take one of the pieces, and pushing the nails through one edge of the cloth, nail it up. The opposite edge, then the two remaining edges, are fastened in the same manner, stretching it tight. Tack the cloth to each joist, to prevent sagging. The cove simply rounds the corners, and is papered over and forgotten. If preferred, it may be painted. The corners cannot be mitered; but a very neat finish may be obtained by letting each piece lack an inch or more of reaching the upper corner and fitting in little cubical blocks before putting on the last pieces of molding. The cloth may be put on without sewing, tacking each breadth separately, but this is more work, and the result is less satisfactory. J. S.

ON THE DEATH OF SAMUEL MILLER.

Another of the old veterans of horticulture has lately passed to the world beyond. October 24 Judge Samuel Miller, of Bluffton, Mo., died at his home in his eighty-first year. He was born near Lancaster, Pa., October 4, 1820. He had a large family, having been the father of nine children, and is survived by seven of them and 38 grandchildren. Mr. Miller was born with the love of horticulture in his soul, and at an early age he decided to follow its pursuits. For many years he grew trees and fruit in his native State, where he originated the grape which he named Martha, in honor of his wife, Martha Isabel Evans. For many years this was the best of the white grapes, but it is now superseded by the Niagara and a few others of later origin. He was honored early in life by being chosen a county judge by his fellow-citizens and also a member of the Pennsylvania Legislature. In 1867 he moved to Missouri and settled on the picturesque banks of the river near Bluffton. Here he had resided ever since. His life has been spent in good works. It was his delight to plant trees, plants and seeds, and watch their development. A new variety of fruit or flower to him was of more interest than the acquisition of property of financial importance. He loved to see things grow, and he worked hard to have all prosper that he planted. The grape was one of his favorite fruits, but he loved to grow all those that would flourish in the region where he worked. He also labored to grow some of those that required special attention. Of late years the persimmon and several kinds of nuts occupied his attention, because he was anxious to see them improved.

Judge Miller was a ready writer for the horticultural press, and his thoughts on paper have helped many others who were laboring in the same cause as himself. He has long been a special contributor of Colman's Rural World of St. Louis. His pen is now quiet forever, and his kindly words of advice will be sadly missed. Perhaps he was a little too sanguine and enthusiastic at times, but he was always candid, strictly honest and fair-minded. My first personal acquaintance with Mr. Miller was at a horticultural meeting in Kansas in 1874. We have often met on similar occasions and corresponded still more frequently. It was a great pleasure to have him serve as an attendant at the Missouri fruit exhibit in the Pan-American Exposition, where he spent several weeks of his latest service to the world in explaining Missouri fruits and their culture and kindred topics. It was while so engaged that a dropsical affection overtook him. This caused his return home in a precarious condition, with the fatal results we so much deplore. Otherwise he might have lived to bless the world for a few years more. One thing that he greatly enjoyed on the Exposition grounds was an extensive plantation of old-fashioned flowers by H. A. Dreer, of Philadelphia. As he and I were walking through the grounds one morning on our way to the horticultural building I pointed it out to him and he at once wanted to see them all once more. It was a great pleasure to guide him through the beds and thus minister to the happiness of a devoted and venerable horticulturist. May his noble life encourage others to follow his good example.

ARCTIC APPLE IN MASSACHUSETTS.

One of our readers in Massachusetts wishes to know whether it would probably pay to set a large orchard of Arctic apples. He says that he has grown specimens of the variety this year that were very fine and excellent in every way; and, if he could produce large quantities, they would probably sell better than Baldwin. What would be your advice with regard to substituting the Arctic for the Baldwin?

So little is known of the Arctic that I cannot advise your Massachusetts reader to plant it largely. If he has fruited it for several years, and it invariably does well, he is better able to judge of its value than anyone else. Fruit is always better on young trees than old ones, and the fruit on two trees in these stages should not be compared. The Baldwin is far from being perfect, and I do not think I would plant it for profit, but would substitute Sutton Beauty and Washington Royal (Palmer Greening). S. T. MAYNARD.

Mass. Ag'l College.

If the reader has been as successful in growing this class of apples several years, as he has this season, it might possibly do for him to try this variety in a small way. But for our New England hills give me the old reliable Baldwin. This apple with plenty of plant food, thorough cultivation and the proper spraying will surely bring success to the grower, while many of the other varieties are not sure. Don't make a mistake and set too many varieties; two or three good reliable sorts are much better than a dozen.

ETHELBERT BLISS.

Hampden Co., Mass.

For Massachusetts at the present time Baldwin is the standard market apple, which counts very much in the profitable and quick sale of fruit. Baldwin is a very productive apple, but to my mind one of its best points is its ability to raise better fruit on a well-laden tree than on young, or trees sparsely set with fruit. Simply because a young tree grows a few fine specimens does not prove it to be valuable. It may not be productive when older, or produce good-sized and well-flavored fruit when bearing heavy crops. With me Arctic is a good grower, but I do not know of its being tested on older trees in our section. It is simply a matter for the inquirer to investigate and decide for himself; then he will know whom to blame if he makes a mistake in trying something new. As a rule, one who does not feel able to meet much loss should not invest in untried fruits too heavily; for others it does not matter. H. O. MEAD.

Worcester Co., Mass.

My opinion is that it would be a mistake to substitute any apple for the Baldwin until it had been most thoroughly tested. Had I something that by one or two years' product I considered better or even equal with the Baldwin, would start in a small way, both by planting trees and setting scions on old stocks until its superiority was apparent. I am not familiar with the Arctic, but should be glad to purchase and test it in the heart of Massachusetts. There is one fact about the Baldwin; it has the habit of bearing abundantly when apples are very cheap, and no crop when apples are scarce and high. I thought some years since that I had conquered that unsatisfactory habit by grafting an orchard with scions from trees bearing the odd year. For a few years they followed the habit of the original stock, but lapsed into the habit of giving the last few years a crop the even year only. From a tree that in 1854 I picked 10 barrels of Baldwins, and for years before an even year tree, I took the bloom from one or two large lower limbs which blossomed and bore fruit the next year, and gradually increased the odd year crop until the tree bore about one-half its crop each year, for 15 or 20 years, but for the last few years, it has returned to its original habit of bearing the even year only. Perhaps by persistence in these two lines of work a permanent change might be wrought. C. E. PARKER.

The Value of Hen Manure.

F. P. H., Philadelphia, Pa.—Would it benefit next year's corn ground to spread chicken manure upon it this Fall and harrow it? The soil is a sandy loam. Is chicken manure as valuable as cow and horse manure, pound for pound, when applied to hoed crops? Give the constituents side by side (for comparison) of each kind, viz., chicken manure and barnyard manure.

ANS.—It is difficult to give a fair analysis of hen manure, because as found on most farms there is a varying amount of dirt, feathers and trash found in it. The figures given below represent a fair average sample of fresh manure:

Pounds in One Ton.	Nitrogen.	Potash.	Phosphoric acid.
Hen manure	35	17	30
Horse manure	11	10	5
Cow manure	7	8	3½
Sheep manure	17	13	5

Thus it will be seen that hen manure is richer than that from other domestic animals. The explanation of this is that the food of the hen is richer, for she eats considerable meat and insect food. Again, the solids and liquids of the hen are ejected together, while in the case of larger animals the liquids are often lost. As usually applied to the soil, hen manure is dried, and the analysis would of course vary, but the above figures are fair for comparison. We would not spread the hen manure this Fall, but would keep it until Spring and at corn planting time either put it in the hill or mix it with chemicals and apply it broadcast. When hen manure is dried and fined it makes a good base for a fertilizer. Let it be crushed and sifted and then mixed in the following proportions: 1,200 pounds manure, 150 pounds nitrate of soda, 450 pounds acid phosphate and 200 pounds muriate of potash. If one is prepared to go to the trouble of crushing and mixing this will make a good use for hen manure.

Poultry and Potato Beetles.

Several Readers.—What are the facts about chickens and Potato beetles? Do they really ever eat the insects?

ANS.—As some have questioned the statements that chickens will eat Potato beetles, it may be instructive to consider the bird enemies of this pest. The Rose-breasted grosbeak early learned to like the insect, and the crow is said not only to take the beetles from the vines, but late in the season digs into the earth in search of hibernating individuals. The common quail and the Yellow-billed cuckoo are also reported as Potato-bug eaters. For several years after the advent of the pest into man's potato patches, the duck was the only domesticated bird that would touch the nauseous insects. Here is an interesting report from Kansas of a duck foraging expedition: "Headed by an old drake, the 20 ducks were waddling off in a beeline for my potato field. I crawled into some bushes and awaited developments. As they came to the end of the rows they seemed to deploy right and left, and such a shoveling in of bugs I never beheld. They meant business, and for fully one-half hour did they continue, until every duck was filled up to his bill with bugs. The expedition was repeated about 4 P. M., and kept up until every bug went under. I have tried these ducks and others since, and find they all like them and seem to get fat on Potato bugs."

Another states that while it is true that ducks, under some circumstances, will acquire a taste for the beetle, still you cannot "bet on it," for they are just as likely to destroy produce more than to balance the account. I do not recall any accounts of turkeys including Potato beetles in their menu; they are great grasshopper eaters, however. As to chickens eating the pest, it is said that for a long time they would invariably give the beetles the go-by. But after a while some chickens learned to eat, first the eggs, and then the "soft-shells," or grubs, and finally acquired the habit of feeding upon the mature insects to such an extent that Dr. Riley has stated that instances had been reported to him where between 30 and 40 perfect beetles had been found in the crop of a single chicken, and this not from lack of other food, but from preference. And there are several other instances on record of chickens eating the Colorado Potato beetle, but it is doubtless an acquired rather than a constant habit with chickens, and perhaps it is necessary to entice the chickens into the potato field with grain scattered on the ground, and at the same time knocking off the beetles and soft grubs among the grain, thus educating the chickens to such a bug diet. This is the method employed by one person who states that it was a success, as the fowls soon began to pick off the insects for themselves. M. V. SLINGERLAND.

Pear Leaf Spot.

L. A. O., Jubilee, Pa.—I send sample of pear leaves, bark and moss. Will you tell me what is the trouble affecting them? I would like to know the remedy. These trees have a good crop of Bartlett pears of good quality, but not as fine as I would like. The trees have been set about 25 years, and have borne a good crop continually since they first commenced. The soil is sand loam.

ANS.—The moss is simply an accumulation of lichens on the bark. Scrape off this moss, and while spraying the trees with Bordeaux Mixture, as recommended below, drench the bark wherever the moss occurs, and it will soon clean the bark. The leaves were badly infested with the Pear leaf-spot fungus disease. It is necessary to spray with the fungicide Bordeaux Mixture for this disease. Three sprayings during the season have given almost perfect protection against it. Spray first just after the blossoms fall, and make two subsequent applications at intervals of two or three weeks. The spraying must be thoroughly done to be effective.

M. V. SLINGERLAND.

ONCE IN A LIFE TIME is often enough to do some things. It's often enough to buy a wagon if you buy the right kind. The

ELECTRIC HANDY WAGON lasts that long under ordinary conditions. First the life of a wagon depends upon the wheels. This one is equipped with our Electric Steel Wheels, with straight or stagger spokes and wide tires. Wheels any height from 24 to 60 in. It lasts because tires can't get loose, no re-setting, hubs can't crack or spokes become loose, felloes can't rot, swell or dry out. Angle steel hounds.
THOUSANDS NOW IN DAILY USE.

THE "ADULTERATED" BALE OF HAY.

We frequently hear stories about rocks, old boots and other "foreign matter" found in bales of hay. Is there any truth in such reports?

In reference to the many stories you hear about rocks, sticks and similar things being packed in baled hay, we think nowadays that they are merely jokes or pure accidents. We find it is a very rare exception when anything like this happens. It used to be a frequent occurrence, but in the last 10 years we think the morale of the hay shippers has reached a higher level, and what they ship as hay is hay, and not full of something else inside the bales.

Baltimore, Md. W. G. BISHOP & CO.

During an experience of nearly 24 years as receivers and jobbers of hay from Canada and all parts of this country, we recollect nothing of the kind coming under our own observation, but occasionally, or once in a great while we hear of somebody finding a stone in a bale. Once we heard of a horse's head being found inside a bale, but we have never heard of more than half a dozen, if as many, cases of fraud of this kind in all of our 24 years. We regret to say, however, that we often find a large quantity of hay seed in the middle of the bales, and this is as much of a fraud as putting in stones and other heavier substances. We find the greatest risk in buying hay from strangers to be the danger of "short weights," and many buyers have been caught in this way.

MACKENZIE & WINSLOW.

Fall River, Mass.

Stories that you hear about rocks, sticks and similar things being packed in baled hay may sometimes be jokes, but my experience, covering a period of 30 years, proves that they are not always jokes. I have had large stones, old boots, sticks and cordwood of various dimensions brought to me by my customers with the assertion that they were found in baled hay. I believe, however, that these are only isolated cases, and that the majority of baled hay is free from them. The hay in which a number of heavy stones were found, was furnished me by a man whose honesty could not be questioned. The hay was baled in an old-fashioned hand press, and when the attention of the shipper was called to the fact that large stones had been found in the hay, he investigated the matter, and found it was due to a rivalry among the men employed on his farm as to who could press the heaviest bales, it being considered a test of strength. I have heard of fish being stuffed with stones to make them weigh heavy, but this is the only case I have ever heard of where very large stones, weighing 60 or more pounds each, as these did, were used to make heavy bales of hay. S. D. ANDREWS' SON.

Providence, R. I.

As far as the packing of stones, sticks or other objectionable articles into bales of hay is concerned, the complaints we receive therefrom are so few that we hardly ever consider it seriously. However, if we go away back in the hay business 10 or 20 years, we remember it to be a common occurrence to find almost anything, from a dead chicken to a rock of almost unlimited size in the center of the bales, but that is, at the present time, what we call a "has been." Of recent years the shippers and receivers have become better acquainted with each other, to such an extent that complaints of any kind are, and can easily be traced back to the original trickster; this being a fact, it has naturally stopped such nuisances to a certain extent. The only time it ever occurs is when a new hay presser begins business, or new men are employed who do the act thinking it a practical joke. It is not always the farmer who is to blame when his hay does not come out correct, either in weight or the contents that may have been put therein. The pressing of hay has become a separate or special business, and is carried on in a great many instances by persons not connected with the farmer in any way, either in the shipping or selling of this commodity, and they, of course, care little what may result when the hay reaches the consumer. It, however, only takes the new comer a short while to learn of the putting-up methods, and to satisfy the consumer he is compelled to put the hay up in proper form or accept any deductions made by the receivers.

GEO. N. REINHARDT & CO.

New York.

In all my experience in handling baled hay during the past 15 years (several hundred cars per year) there never has come to my knowledge a case where we have found stone or other makeweights baled up with hay for the intent purpose of fraud. Only the other morning our men ran a hay knife through the cutter, and neither the man pitching, nor the man feeding the cutter with his hands, discovered it until it was in the cutter; so it is possible sometimes for some small stones or horse shoes, that may be gathered up with the horse rake, to get into the press, but any man accustomed would quickly make the distinction between these things and something that was large enough to need special help to get in. There have been undoubtedly a few cases of the kind, but I believe they are well out of date, and fully as much or more trouble now comes from ignorance of what constitutes different grades of hay, on the part of the balers in the country, many of them never having had the chance to see well-graded hay in our large hay markets. Such a visit would clear up the mystery to many a man who accuses unjustly the commission man, and the buyer of his hay whoever he may be, by showing him his own by the side of better and correctly defined grades. We all judge things by comparison, and the lack of this opportunity in the hay business, I believe to be the source of much so-called fraud. We have bought hay from many shippers in Canada, New York, Pennsylvania, Ohio, Indiana and Michigan, and had there been foreign substances in the bales we certainly should have heard from it, quick and direct. Dealers in baled hay, car lots, usually protect themselves against short weights and off grades, but the risk on frauds from stones, etc., would be considered so small as not to be mentioned; in fact, if we bought a man for the price of a small rock we would think that we got him cheap enough. The same rule applies to buying hay that fits in all commercial transactions; buy of men who have a reputation and are known to be reputable dealers, and keep clear of those who are on the dishonest side, or even those who seem to be on the fence.

Union City, Pa. W. L. MITCHELL.

Migratory Bee Keeping.

Several Readers.—We have seen an article in some of the papers giving the story of a northern bee-keeper who keeps his bees at the North as long as the honey flow lasts, and then carries them to Cuba, where they continue to work during the remainder of the year. Is there any truth in this report?

ANS.—There is and has been what is known as migratory bee-keeping, that is to say, the owner of 100 colonies may, after the bees have gathered all the honey in one locality, or when the season has finally closed, remove these same bees either by rail or by boat, to a southern climate where the season is just beginning again. In this way he is able to get two crops instead of one. Mr. C. O. Perrine, about 20 years ago, tried this plan on a large scale. The whole apiary was put on a good-sized raft on the Mississippi. The bees would be left for a couple of weeks in one location and then moved southward to catch another honey flow, but the experiment proved to be disastrous, because the bees dropped down into the water and were drowned. This so decimated the strength of the colonies that the bees could not store any considerable amount of honey. Taking it all in all, migratory bee-keeping has not proven to be profitable. The little item referred to, like a good many other newspaper accounts, is only partially true.

E. R. ROOT.

Fancy Prices for Apples.

D. W. R., Hickman, Ky.—I have about 250 bushels of select Winesap apples. I wish I could place them at the extra fancy prices THE R. N.-Y. mentions. I am familiar with many varieties of apples and know none that approaches the Winesap as a cooker. The sauce is nectar rich, aromatic, and truly of a winy flavor. Will you suggest a way for me to place my apples where they would bring high prices?

ANS.—The prices quoted were of course retail. No one here would pay such prices to a stranger, or buy that quantity of fruit without sampling it. The restaurants and hotels like to buy produce of commission men. They can see the goods, and thus they know just what they are buying. Most of them have few facilities for storing fruit and want their supplies delivered in small lots. At present, your best plan will be to correspond with some good commission man and make a bargain with him to handle the apples. There is a scarcity of fine fruit this year, and those Winesaps ought to bring a good price.

More About the Clark Grass.

H. L. C., Cumberland, Me.—Mr. G. M. Clark gives on page 708 some figures about his hay crop. Does it not strike you that $16 per ton is quite a high average for hay in the barn for the last 12 years, or that $9 will do all the work to an acre of ground that Mr. Clark claims to have done, page 708? I have been working eight acres the past Summer, harrowing every two weeks, and now that it is sowed I find the cost way ahead of that price. If $9 will fit an acre of Mr. Clark's ground, what does he allow per day for team and man?

ANS.—In making my estimate for 12 years on a certain section of my hayfield I have figured the grass at $12 per ton, and found that at that price the profit on seven acres for the 12 years is $5,581.40, but if I had figured it at $16 the profits would have been $7,433.40. I have never figured in my estimates as high a price as what I actually received. As to the cost of labor, if H. L. C. should use the same tools that I use he would find that at 30 cents an hour for a man and team, which I figure for common farm labor, it would not cost him $9. I have always given figures favorable to the producer when proper tools have been used. If he will use the double-action harrow he will find that it will not cost him two-thirds the price that I have named. GEORGE M. CLARK.

Won't You

Write a Postal

To Get Well?

Send me no money, but simply write me a postal if you are not well. Pay when you get well.

I will send you a book that tells how a lifetime of study has enabled me to strengthen the inside nerves. Those are the nerves that operate the stomach, kidneys, heart, womanly organism, etc. Weakness of these organs means weakness of those nerves. Nerve strength alone makes any organ do its duty.

I will send you, too, an order on your nearest druggist for six bottles of Dr. Shoop's Restorative. Use it for a month, and if it succeeds pay him $5.50 for it. If not, I will pay him myself.

No matter how difficult your case; no matter what you have tried. If my book shows you that your trouble is nerve weakness—and most sickness is—I will warrant my Restorative to cure you.

I fail sometimes, but not often. My records show that 39 out of 40 who get those six bottles pay, and pay gladly. I have learned that most people are honest with a physician who cures them. That is all I ask. If I fail I don't expect a penny from you.

Mine is the only way to restore vital nerve power. Other treatments bring but fleeting results at best. If you want to be well, let me send you an order for the medicine. If it cures pay $5.50. I leave the decision to you.

Simply state which book you want, and address Dr. Shoop, Box 570, Racine, Wis.

Book No. 1 on Dyspepsia,
Book No. 2 on the Heart,
Book No. 3 on the Kidneys,
Book No. 4 for Women,
Book No. 5 for men (sealed),
Book No. 6 on Rheumatism.

Mild cases, not chronic, are often cured by one or two bottles. At all druggists.

DRINK PURE WATER

By using the Bucket Pump and Water Purifier on Wells and Cisterns. Will purify a foul well or cistern in 10 days' use, or money refunded. Draws 10 gallons of water per minute. No tubing to rust, burst or wear. Will not rust; chain and buckets made of galvanized steel. Can be set up in 15 minutes. No attachments below the platform. Will not freeze; buckets having hole in bottom drain themselves. Makes bad water good, and good water better. Prevents scarlet, typhoid and malaria fever. Write at once for circular and special price to introduce into new territory. ROSS BROS., 90 Front St., Worcester, Mass

WELL DRILLING Machines

Over 70 sizes and styles, for drilling either deep or shallow wells in any kind of soil or rock. Mounted on wheels or on sills. With engines or horse powers. Strong, simple and durable. Any mechanic can operate them easily. Send for catalog.
WILLIAMS BROS., Ithaca, N. Y.

26 Bu. Baskets AN HOUR

with our Wolverine Geared Ball Bearing Mill. Grinds ear corn, rye, wheat, shelled corn, etc., fine or coarse to a very uniform feed, because burrs are brought together very true. The only Sweep Mill that grinds all grain, equal to a burr stone mill. CAPACITY is large because the mill is Triple Geared. Our 17 in. burrs on this mill revolve three times to each turn of the team, making them equal to 51 in. burrs on most single geared mills. Therefore, we give you the largest capacity and most uniform feed possible to produce on a sweep mill. RUNS EASY because all friction is relieved by our improved Ball Bearings. Is the largest and easiest running geared mill made (Wt. 675 lbs). Our prices are low because we have no agents. We guarantee this mill to grind 1-3 more than any other 2 horse geared mill. We have 8 sizes of sweep mills $14.25 and up. Thirty other styles of grinders for all purposes. Free catalogue of 15,000 articles. Ask for it.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

CLOVER AND COW PEA BENEFITS.—Reference has been made in these notes to the usefulness of Crimson clover and cow peas as hen forage. We are able to report an increasing partiality for these nitrogenous foods among the two flocks of chickens kept on the Rural Grounds, and correspondingly good results in the way of egg production. Hens readily take to clover in any variety, but they are often shy of beans, seldom eating them uncooked. An appetite for raw peas or beans may be considered an acquired taste coming on gradually. Our hens ignored the cow-pea seeds the first season they were grown here, and only developed the taste late in the Winter when scratching the pods open by chance in a sheltered part of the field. The example of contented old biddies coming in with comfortably extended craws and an urgent thirst for water to complete the swelling process proved contagious, and they all now hurry to the field at once on being released from the yard. There can be no doubt as to the beneficial effect of the exercise needed to get the pods open, nor of the high food value of the beans themselves. The Rural Grounds lie in a strip about 800 feet long by 200 wide. There are poultry houses near each end, and the flocks have but little chance to mingle, as they are necessarily kept yarded most of the time, yet the cow-pea habit, which we heartily approve, seems to have been communicated. The second flock has no access to the fields, but acquired the taste from scratching the gathered pods shelled for seed. An increase in egg yield was noted in both cases as quickly following the ripening of the Early Black cow peas, which is the variety best suited for us. Cow-pea seeds, when ready for market, are too costly for poultry food, but we are convinced that a patch of these hustling land improvers handy to the chicken yard is a good investment where practicable. Crimson clover has become a necessity, sown in August between bush fruits and after early crops to improve our soil and diminish washing by Winter rains, and incidentally as forage for the fowls, who keep the more accessible strips sheared as closely as with a lawn mower. The season has been favorable and the plants on early-sown strips are now seven to eight inches high, but we find such leafy plants do not, as a rule, winter as well as those closely picked by the fowls. Chickens are fond of green food, but eat very few weeds with relish. If not provided with clover in this manner they are very troublesome on the lawn, when at liberty. These clover strips entice them away, and thus fit in all along the line.

A NEW HARDY PEACH.—Peach culture has been lately extended over an enormous area, this delicious fruit being grown from Florida to Canada, and from Texas to Washington. J. H. Hale says that there are now no "peach districts," as peaches may be grown anywhere if attention is given to the wants of the tree. Residents of cold latitudes know, however, from bitter experience how quickly the hopes of a crop may be blasted by a hard freeze, and are little inclined to plant southern varieties, or those supposed to be tender in tree or bud. The so-called hardy peaches, Crosby, Bokhara, etc., while quite resistant to cold, are not altogether satisfactory in fruit, and new sorts for northern culture are wanted. Stone & Wellington, Toronto, Canada, send us the peach illustrated in Fig. 350, page 771. They say that the tree has been bearing four years in Toronto, and shows great hardiness, never having been killed back in any degree. It ripens in that locality about the first week in October. The flesh is yellow and of good quality, though our specimen was overripe. While not believing in the multiplication of varieties, the originators think that this one is worthy of propagation, and have named it Wellington. They say that the peaches happened to be smaller this year than previously, as the overloaded tree was not thinned. Good specimens should be one-third larger than represented. If this peach should really prove as hardy as its present condition seems to indicate there is a great field for it.

FINE AUTUMN FLOWERS.—November 1 does not often find nasturtiums, marigolds and geraniums in brilliant bloom outside, but these old favorites never showed to much better advantage than at this late date. A few nasturtium leaves have been nipped by frost, but the flowers are as perfect and plentiful as ever. Geraniums, marigolds and Verbenas as yet show little deterioration from the lengthening cool nights. Burbank's Elegance Verbena was particularly bright and sweet throughout October. Cannas open many blooms, considering the lateness of the season, but the foliage begins to show the effects of cold, while the brilliant clumps of Salvia or Scarlet sage, always locally grown in abundance, are fading out rapidly. Hardy Chrysanthemums, Cosmos and Japan Anemones remain to round out the gardening year. The daily brilliant sunshine, almost continuous for the last six weeks, warms the soil so that a fair rate of growth is still maintained on unripened plants. It is getting rather dry for celery, however, and there is a noticeable falling off in its development within the last two weeks.

W. V. F.

10 Weeks for 10 Cents. You have several neighbors and friends who need THE R. N.-Y. We are going to help you to see that they get acquainted with it. For our part we will send the paper to them now 10 weeks for 10 cents—a cent a week. We ask you to call their attention to this offer. Perhaps you can get up a club. The 23 largest clubs will each get a cash premium January 1. Will you be one of them?

17-YEAR LOCUSTS AND PEACH TREES

In regard to the 17-year locusts I think that the probable danger from them is overestimated. I should not hesitate to set out an orchard or make improvements, provided on long-cleared land. Where forest trees or brush rows had been removed it might be different. It was my observation 17 years ago that the locusts confined themselves exclusively to wild thickets and forests, or where such growth had been. G. D.

Whitehouse, N. J.

I do not predict serious damage to fruit trees by the locusts next year in the rural districts except perhaps to young chestnuts, which they are very severe on. In boroughs or villages where other trees are scarce they may cut severely. I noted them closely in 1868 and 1885. They fairly mowed the chestnut and oak thickets, but our orchards were not damaged much as a rule. I believe in thorough pruning, especially peach, and Kieffer pear trees. Less fruit buds, larger fruit; quality rather than quantity, therefore follow up the sawyers with clear-cut pruning shears. W. S. C.

Collingswood, N. J.

I have seen some injury done to young trees by the locust, but do not now recall any instance where the injury was severe enough to ruin the trees. From past observations the locust is not general, but confines itself to certain localities along sandy or high wooded ridges, and works more on forest trees than anything else. Still, if young trees are planted on or near such situations, which were infested by them the last time the locusts came, they would, no doubt, be severely injured, and I would not advise planting in such places, but as to the wholesale abandonment of tree planting I think it folly; I shall plant just the same as though no locusts were coming. If they ever are prevalent on level areas I have never known the fact. I would advise those who contemplate planting to do so unless, as I state, they expect to plant near localities that were infested 17 years ago.

Mercer Co., N. J. CHAS. BLACK.

Near the river here we have never had any locusts. In 1851 on the upper end of our farm, or rather in the timber, they were plentiful, and their effect on the oak trees was very plain. Locusts are seriously injurious only near timber lands, that have been standing over one locust year, and where there were great quantities in 1851 there were very few in 1885 in timber land, and none where timber had been cut, so that I think, judging by the past, that locusts will only be an obstacle to tree planting near where there is timber or was timber 17 years ago. I intend to plant some peach trees in the Spring, and do not anticipate any serious trouble, although timber is not very far off. The locusts are partial to oak trees. I. J. BLACKWELL.

Mercer Co., N. J.

When the locust brood was around before I was fresh from college, and gave these matters but little thought. As soon as I received Prof. Smith's warning I at once talked with some of our older fruit growers, and failed to find wherein the brood did much harm before. Wishing to plant about 4,000 or 5,000 peach trees next Spring I wrote Prof. Smith for advice. He said he would "plant but not trim until June, planting only the largest trees." To sum up, I expect to plant over 23 acres with peaches and run the risk. By the way, I dare not try the Stringfellow method, as my only success in peaches is from working the soil from May until August. I should think some of those back fields of Hope Farm, unless too much clay, would be a grand source of income when planted to peaches.

Sussex Co., N. J. A. E. R.

Stringfellow Method in Tennessee.

I was glad to read your recent reference to the Stringfellow plan of tree growing, and desire to give a little experience of my own on the same line. I have an orchard of 2,400 peach trees here, six years old. It had been given intensive cultivation until last year, only to have the blooms killed by a late frost. In disgust I let it severely alone last year. As usual the late frost showed up, but the ground being compact the sun did not penetrate, my blooms were late and the result was a splendid crop of fruit. After picking the orchard being so weedy I cultivated it, with the same old result this year—no fruit; killed by a late frost. I confess I had no patience with Mr. Stringfellow's method before, especially his plan of setting trees, but in the future I am with him on after cultivation; i. e., a pair of good horses and a mowing machine.

Morristown, Tenn. H. L. D.

The Alton Peach.

On page 726 J. B. Rogers undertakes to tell us all about the above peach, and how it got the name of Alton, where it originated, etc. T. V. Munson, of Denison, Tex., originated the peach, and sent it to me under the name of Minnie. It was so good that I sent some buds to the Experiment Station at Alton, where Stark Bros. got it and changed the name to Alton. Names of fruits should not be changed without the consent of the originators. The tree Mr. Munson sent has borne 14 crops of peaches in 15 years (the 1899 freeze was too much for it), and the 1901 crop was over 20 bushels, so I think it a good one as a fruiter, but the quality is not as good as Mountain Rose. G. W. ENDICOTT.

Pulaski Co., Ill.

DIETZ

Lots of Light concentrated and thrown directly where you want it, in stable, cattle shed, mill, cellar, alley, etc., is obtained from

HOPE FARM NOTES

POLITICS.—The Hope Farm man did his share of work on the stump this Fall. It seems to take a good many words to convert a voter. I am led to believe that it is easier to pull out the stump of a Northern Spy apple tree than for the average man to get on the stump and pull out political convictions by the roots. I read of orators who drive their hearers so crazy with conviction that the crowd will unhitch horses from the carriage and drag the speaker along in triumph. Truth compels me to say that nothing of the sort happened to me. I was obliged to walk or drive Nellie in the old buggy. I must conclude that I fall as far short of those soul-stirring orators as I do of those wonderful farmers who never make a mistake, whose hens lay 350 eggs a year, whose potatoes never fall short of 600 bushels per acre, and whose children are such remarkable specimens that they never need spanking and never even have a dirty face when company comes!

VERBAL BOUQUETS.—Once in a while the humblest of us will receive a little compliment that means something. I find that the Hope Farm folks are quite reconciled when they are forced to forego the pleasure of listening to my oratory. The little Graft, however, has an appreciative soul! As he was going to bed a few nights before the election he looked up at the Madame and said:

"I *would* like to hear him speak! Why, I'd rather hear him speak than to go to another Punch and Judy show!"

Now there are two ways of regarding such things. My political opponents will say:

"What did we tell you? Here's a member of his own family admitting without reserve that his arguments are on a dead level with a Punch and Judy show!"

That's one side of it—here's the other. A Punch and Judy show represents the most exciting theatrical entertainment our little folks have yet seen. When the little Graft gave his opinion he went beyond his highest fixed ideal of fun and excitement. There you are—it's all in the point of view and the standard you set up.

The result was that one cold and foggy night the little Graft drove with me nearly 15 miles back and forth to a political meeting. The little chap was good company. He sat on a front seat and drank in all the speaking. It was nearly 12 o'clock when we got home, but the little campaigner never winked. The Madame had made some sandwiches for us, and we ate them with good relish as we drove through the thick fog. The Graft kept his ears wide open listening for teams and trains, for we could not see a rod ahead of us in some of the hollows. The little chap finished his sandwiches, and after some thought—piped up in his soft voice:

"I believe just as that man does—I tell you that license is a bad thing!"

"But what *is* license?"

"I don't know, but it's an awful bad thing, because that man said so!"

Some grown-up folks will smile at that, and yet they are but grown-up Grafts! If a great big share of the voters of this country have any more real logic or reason about their voting than the Graft has about *license* your humble servant has not been able to observe it. The other man seems to be better able than I am to make people decide what is worth voting for.

WEATHER NOTES.—Take it all through we have had a glorious Fall. On November 3 the Cannas in the door yard were still green. The corn on the hill looked rusty, but the peach trees were still green. The forest trees are dropping their leaves rapidly. Some of them gave up early. I observe that some oaks and chestnuts stand with bare branches, while others are still well leaved. This is not due to exposure either. I notice the same thing in apple and other trees. Truly, some trees have strong and real character, just as certain humans seem able to toss off disease or temptation that will strip off all that makes life enjoyable for others. . . . The yellow turnips have not turned a hair for Jack Frost yet. They seem likely to keep on growing up to Thanksgiving at least. It is high time to keep the cows and the hens well sheltered at night. It has been great husking weather, and the boys have been pushing the work. We want to get both corn and fodder under shelter before the long November rains set in. We much prefer to husk in the field, but it may be necessary to haul the last few loads in for barn husking.

FARM NOTES.—On November 1 one would have thought that the Boers were capturing a British convoy in our valley. It was only the hunters celebrating the "open" game season. The quail that we have tamed and fattened through the Summer were in danger that day, and so were the cows and the children. My own theory about game is that it belongs first of all to the farmer on whose farm it is found. We haven't so much as a pop-gun at Hope Farm, and none of us cares to hunt. That being the case, I hold that neighbors on adjoining farms who want to hunt and are careful about fires and about shooting should have next right to the game. As to the pot-hunters and careless fellows from town and city, I claim that they have no moral right to shoot our game. I would keep them off the farm and try to get neighbors to combine and post notices all over the community. . . . Our tools are ready for Winter. Philip took the larger tools apart, scoured the metal parts and daubed them all over with crude petroleum. The sulky plow, the Cutaway harrow and the mower will make a big quarrel for room if you leave them as they were used. Take their tongues out and they pack closely and comfortably together. That is true of humans also. A working tongue makes a mighty wide house necessary, while one that is hung up under control permits close packing in small compass. . . . I have never known such a large proportion of red ears as we find this year in the corn. It is a yellow dent from selected seed, and we are sure that not a single red kernel was planted. Yet the red ears roll out in numbers sufficient completely to demoralize an old-fashioned "husking bee." Too bad that all this blushing maize is wasted on Hugh, Charlie and Philip. . . . We expect to keep on sowing rye up to the middle of November anyway. After the corn is off we shall work up the ground with the spring-tooth and sow rye. Ought to have done that 80 days ago, you will say! You are right. That is one of our oughts. All that corn ground ought now to be six inches deep in living green.

STONE WALL REFLECTIONS.—No, I am not going to tell about my own Sunday afternoon reflections on that stone wall. I sit there now and then, but I don't tell about it. Why, some of the men who are up to that very business themselves turned around and made great sport of me. I am just drawing a mental picture of a man who wandered off to the hills one Autumn day. Strange fancies led him along, old memories dogged his footsteps, doubts and coming difficulties put a burden on his shoulders. He sat down because it seemed as though the things that stirred in his mind demanded every energy and muscle of his body. It was a glorious day, but he could only see in it the coming of the year's end. The color had come to the leaves and the white had come to his hair. That tree below him was stripped of leaves. A hawk's nest was fully exposed. It was started when the leaves were thick, in the hope and belief that it would be hidden from view. The man saw it, and reflected how he had sought to build cherished ideals and ambitions only to have the winds of chance and circumstance expose them, crude and undeveloped, to the ridicule of thoughtless ones. A great thicket of chestnut had grown up in the path of the northwest wind. It stood in the gap, and shielded the tender peach orchard from the biting wind, yet for a few dollars the farmer had slashed and hacked these friendly trees away. The man thought how long years of denial and hardship had been rewarded by stinging ingratitude or worse. A younger man could have laughed such thoughts away, for youth cannot realize what the Autumn of life really means. For a moment the man did not see so clearly as before, but when the dimness passed away, a mighty change had come over the silent hills. The bare limbs of the dead trees, the yellow corn, the green rye, the red maples and the brown soil seemed to have been grouped by the very finger of God until he read in mighty, unfading letters:

"For I bear in my body the marks of the Lord Jesus."

ROUNDING IT UP.—This man had never been what most people call a religious man. It would hardly be possible for him to live up to all the forms and outward show of religious life, yet there came to him that day on the hills an answer to the question which had puzzled him for years: "Why is it that some lives must be classed as a long-drawn-out sacrifice, denied the things they most desire, and burdened with things they cannot use for their own happiness?"

The children came running up the lane waving their little hands to him. He went down the hill, a smile on his face and a great glory in his soul. What pleasant tidings do these little ones bring? The little tot who reaches him first drops out her words between her gasps for breath.

"Oh, Father, you let the fire go out and didn't leave any dry wood. Mother is *awful* mad!"

All of which goes to show that the little things of the present should come in ahead of the larger things that belong to the past and future. H. W. C.

HIRED MAN'S LUCK.—The Farmer's Guide tells the following story: A farmer sent a green hired man out with the planter to plant a big field of corn last Spring. The farmer supposed that the hired man knew how to operate the machine, and he did, as it turned out. About the time he had the field planted the farmer went out to the field and discovered that the man had set the machine so that all the seed corn was planted from four to five inches deep. Then the farmer lifted up his voice and cussed this hired man in a most eloquent agricultural way. Well, a third of the corn never showed above ground, and what did had a hard pull to get through and looked very tired. The crop was cared for, however, and then came the drought, and the cornfields with a good stand and properly planted little by little gave up the ghost and became an acreage of seared fodder, while the hired man's field with its thin stand and deep-rooted corn showed up green and luxuriant and will make a crop of 40 bushels per acre. Fool luck, was it not?

SOUND AS A DOLLAR

That is the result of a course of treatment with Scott's Emulsion. We have special reference to persons with weak lungs and sensitive throats.

Scott's Emulsion does some things better than others. This is one of them. It has a peculiar action on the throat and lungs which gives them strength and makes them tough.

That's how Scott's Emulsion drives out coughs, colds and bronchitis. It keeps them out, too.

We'll send you a little to try, if you like.
SCOTT & BOWNE, 409 Pearl street, New York.

SATURDAY, NOVEMBER 16, 1901.

IT seems from what the hay dealers say on page 773, that most of the stories about rocks, old boots and other "foreign substances" in hay bales are "fakes." It is easy to accuse the farmer of cheating, but an investigation of this sort shows that there is really less of it than one would suppose. Modern methods of doing business are often a great check on dishonesty, because when the consumer finds that he has been cheated the disgraceful record is handed back through one handler after another to the original seller—and he is rightly shunned. But what a world we would have if true honesty were applauded as dishonesty in such matters is condemned!

*

MR. Clinton's article on teasels is useful in again bringing out the fact that there are little localities or pockets scattered over the country which are well suited to some particular crop. It is a legitimate part of agriculture for one to hunt out these localities and utilize them. Many of us do not really know what crops our farms or fields are best adapted to. Perhaps we lose time and money every year because we try to grow potatoes on soil that never was designed for that crop, or grain on fields naturally adapted to fruit. No one would think of suggesting teasels as a crop for all farmers, but the facts about it ought to set every farmer to studying the needs and capacity of his own farm.

*

THE American Apple Consumers' League is growing. The Fruit Trade Journal of this city prints the pledge and pats the League on the back. There is no fooling about this movement. Just go ahead and "call for apple." Human nature will do the rest. We have this note from a city man:

> Could you recommend me to some good man who would sell me A1 goods at a fair figure? A man who does not wish to become rich through a single transaction would be the right party. E. D.
> Life member A. A. C. L.

There is the weak point in the business. Where are these fine apples to be bought? The time is rapidly coming when there will be in this city alone 50,000 families who will demand a box of fine apples each week. The California growers are preparing for that trade. What a wonderful opportunity the New York State Fruit Growers have to put guaranteed boxed apples on the market! Keep up the call for apples. "Absence makes the heart grow fonder!"

*

ONE Saturday afternoon, in this city, the writer saw a large wagon loaded with baskets of grapes which were being sold at 10 cents a basket. The price was so low that people at first fought shy of them, but finally it was found that the grapes were excellent and the load was quickly sold out. Investigation showed that the man who grew and shipped these grapes had actually secured more than the buyers paid. How could that be possible? It turned out that the commission man had paid an average price per basket for an entire large shipment. They had been sold at different prices—the average being such that he cleared a fair profit. On Saturday there were a few hundred baskets left, and more were coming the following week. It was decided to close them out at once at a low price, since the entire shipment had already paid. In one way it was a good advertising dodge. People who bought these grapes were sure to notice the names of the grower and the commission man, and call for their goods when they bought again. Every taste of good fruit creates a craving for a dozen more, and this is what builds up and develops trade. In most lines of business manufacturers are willing at first to give away the price of one article to advertise four more.

*

THE postal authorities have issued an order denying the use of the mails to a so-called art manufacturing company in this city. They advertised to give profitable employment at home, and promised to buy the work done by those who sent them $3.50 for an outfit. The books of the company failed to show that they had ever made any of these promised purchases, the whole thing being a clear case of fraudulent intent. The Government is also after a number of oil companies which have sprung up in Texas and are trying to sell worthless stock in the East. It is said that of the 550 or more oil companies which have been organized in Texas during the present year less than one-fifth hold any property of value. It is a hard blow to these frauds to shut them out of the mails, and all who run across clear cases of this sort should communicate with the postal authorities, giving all the facts.

*

LAST week we had a good article describing some of the peculiar methods of culture which have made the apple orchard of Grant Hitchings famous. We always hesitate before printing such articles. They are as true as human mind can put them, yet readers do not always apply them as they should. We may safely say that whenever any farmer makes a true statement of results that are much above the average, it is always safe to assume that some natural advantage of climate, soil or location is partly responsible for it. There is generally some controlling factor which either cannot be duplicated by all, or else requires the most patient study and the most ceaseless toil. We do not say this to discourage anyone who tries to duplicate these remarkable successes, but rather to point plainly to a fact which many of us must learn to our sorrow. One great trouble with agricultural journalism as we view it is the fact that writers try to paint the story of their successes without a shadow of qualification.

*

THE Milk Commission of the New York Medical Society has been investigating the city's milk supply. They make various suggestions about the care of the milk on the farm, some of which are sensible. The following, however, strikes us as getting down to a point finer than the bacteria which it is desired to keep out of the milk:

> In addition to having a milker clean shaven, it is better that he should be a single man than a married man, because the former is less likely to carry infection from his home, as the details of his living admit of better oversight.

There has long been an outcry against the child of the hired man, and this looks like warfare on the married milkman. If our medical friends really desire to improve New York's milk supply they may well bring all their guns to bear on the enforcement of a law which compels dealers to steam thoroughly all milk vessels sent back to the country. Let the cans be well steamed here and there will be less trouble at the farm. Don t waste your time over the married man and his beard, gentlemen, but see that the cans are steamed!

*

IN a recent address before the American Bankers' Association Secretary Gage among other things said:

> Taking the last 30 years, what sum, on the average, in excess of an ample working balance has the Treasury kept under lock and key and away from all current use in the fields of industry and exchange? The amount is found to average $50,000,000. If these surplus millions had been deposited with National banks in the Clearing House cities in the proportion the relative capital of each bank bears to the whole capital; and if secondly, the only security to the Government had been, in case of bank failures a prior lien on such bank's assets, not a dollar of loss would the Treasury have suffered. Next, if under these conditions the banks had paid interest to the Government at the rate of two per centum upon the funds so deposited, how much would the Treasury have been benefited? Answer: $32,000,000. With this fund as an aid to their general operations in the field of trade and commerce, to what extent, on the average, would the banks have been able to increase credit accommodations to the people? Answer: $200,000,000. Have we not been guilty of an enormous economic waste by reason of our peculiar Treasury system?

The "idle dollar" is usually more of a curse than a blessing. It would seem as though every honest dollar should be regarded as a tool to be kept clean and free from rust by fair work. Why should Uncle Sam keep such vast sums hidden away in his stocking, while worthy enterprises are suffering for the lack of credit or capital? How absurd it is to keep these great sums of money in the Treasury and still keep up the stamp taxes levied during the war with Spain! The remaining war taxes are no longer needed for purposes of revenue, and should be repealed at once.

"WHAT are the chances of passing the Grout bill this Winter?" We were surprised to hear this question from a man whom we supposed took little interest in trade matters. He went on to explain: "I have read about this bill in THE R. N.-Y. At first it did not impress me as of much importance, but I now understand the principle that lies back of it. The whole thing comes down to a question of business honesty. The oleo people have had every chance to be honest if they really cared to sell their product for just what it is. They have declined the chance, and now it is a question of chaining them to honesty with a high tax. If they are permitted to sell a counterfeit the way is opened for dozens of other frauds and adulterations. Therefore this is a matter which concerns the whole body of American common people. It will establish a precedent one way or the other, and there is every reason why it should be decided honestly."

*

FROM all over the West come reports of corn shows and studies of the corn ear. All these things help farmers to decide just what a good ear of seed corn should look like. A few wise men here and there have for years taken great care in the selection of their seed. In some cases they had but a crude idea of what was wanted in the shape and character of the ear, yet by selecting what they called the "best" they have produced a local strain which produces a fine crop. The work now being done is an effort to learn just what the "best" ear is—what shape, how many rows and the size of the kernel! One trouble with many farmers is the fact that they have no definite standard for seed or work. A man can no more farm well without some ideal in mind than a hunter can learn to shoot without a target. This plan of studying and classifying the desirable points in an ear of seed corn is excellent, and will surely increase the yield of all who try it.

*

LAST year we imported into the country 34,735,682 pounds of Egyptian cotton, valued at $5,204,853! The year before nearly 50,000,000 pounds of this cotton were imported. Strange, is it not, that while this country supplies its own mills and actually exports nearly 3,500,000,000 pounds, it must still send $5,000,000 abroad for cotton! There is nothing strange about it when we understand that the Egyptian cotton is of a peculiar quality which we have not yet been able to duplicate profitably. We must first find some place in this great country where the conditions of climate and soil which prevail in Egypt can be duplicated. For several years past the Department of Agriculture has been searching for just such a place—and it is now reported that New Mexico and Arizona give just the conditions required. It is hoped that out on the sands of these territories a way may be found to wipe out our National cotton bill. One of the most interesting things connected with the development of American agriculture is the slow and patient search for sections where may in time be grown the sugar, tea, coffee, fruit and other food products which we now purchase abroad.

*

BREVITIES.

A TICKET is a bill of fare.

Cow peas for humus—Canada peas for hay.

YOU turn a bill into a William by paying it.

GIVES a good account of itself—the cow pea.

CAMPAIGN cry for the dairyman—the full milk pail!

THE hen, as ever, stands ready to do her share for the family.

SOME men have the stuff in them—others are simply stuffed!

WHY, oh why, has not the surplus rooster been made into pie?

SOMETIMES a so-called scientist at some tough nut will squirm. Instead of saying "I don't know" he gets behind a "germ."

MANY young men need both help and advice. They demand the first and kick hard when the latter is gently handed them.

IT looks as though the programmes of the various horticultural and agricultural meetings would be better than usual this year.

To bring the discussion of work for the country girl down to a more definite target we will say that she now asks whether balsam pillows will sell!

TWELVE deaths from lockjaw, as the result of infected antitoxin supplied to diphtheria patients, is a matter the St. Louis board of health must investigate very closely. It will be used as an argument to strengthen the claims of anti-vaccinationists.

VARIOUS devices were employed during the recent campaign in this city to break up opposition meetings. One man employed two dogs which started a fight just as the opposition speaker was getting his best licks. Another employed a professional "fit thrower" who had what is known as a "fake fit" just when the speaker most needed his audience!

Events of the Week

DOMESTIC.—General Miles, in his annual report, disputes the theory that the abolition of the army canteen prevents enlistments and causes desertions. . . . . There is an epidemic of smallpox on the Kickapoo Reservation, near Hiawatha, Kan. . . . . A fire which started in a picture frame factory in Chicago, Ill., October 30, made 75 families homeless, and caused damage amounting to $250,000. . . . . Forest fires were raging along the slope of mountains in Tazewell County, Va., between Graham and Flat Top Yards, October 31. The entire mountain was a sheet of flame, and a vast amount of fine timber and fences have been ruined. The flames have crossed from one side of the railroad and river to the other at numerous places. . . . . Yaqui Indians are on the warpath in Sonora, Mexico, recently attacking ranchers near Onaias, where they killed 30 persons. . . . . There is an epidemic of smallpox among Winnebago Indians in northwestern Nebraska, and many of them are dying. An attempt was made to vaccinate them a month ago, but they rebelled against it. . . . . November 3, fierce forest fires were raging near Poplar Bluff, Mo.; the woods had been on fire three days, and farmers and stockmen, whose cattle and horses were in danger, turned out in force to fight the flames. . . . . November 3, a fire which started in a peg mill at Lisbon, N. H., destroyed a large part of the business section of the town; loss $100,000. . . . . The Jacob Dold packing establishment at Buffalo, N. Y., was destroyed by fire November 3; loss $100,000. . . . . Great alarm has been caused in St. Louis, Mo., by a number of cases of tetanus or lockjaw, 12 proving fatal. The disease appears to come from infected antitoxin supplied by the city board of health for diphtheria cases, the serum being cultivated for this purpose. The horse supplying it was affected with tetanus. . . . . The Pan-American Exposition closed November 2. The Exposition has not been a financial success, but it is believed the benefits derived from it will be of great value to the commercial interests of the country. The financial loss will be in the neighborhood of $3,000,000, which will fall upon the holders of the common stock, the holders of second mortgage bonds, and the contractors who erected the buildings. The total number of admissions for the six months was close to 8,000,000. An average of 2,000,000 a month had been figured on by the Exposition officials. The great snowstorm of last April was a severe blow to the Exposition. An immense amount of work was undone, and work on the grounds and buildings was delayed for a week. The lamentable tragedy in the Temple of Music, which robbed the nation of a beloved President, was another blow to the Pan-American. The attendance had been increasing steadily up to the date of the assassination of President McKinley. The gates were closed for two days, and when reopened there was a drop of 12 per cent in the attendance, and no improvement followed. . . . . What is said to be the strictest pure food law in the United States went into effect in New Jersey November 1. Its enforcement has been intrusted to the State Board of Health. Under it the office of State Dairy Commissioner is abolished and a chief food inspector substituted. There will be a large number of deputies throughout the State. Everything that can come into use for human consumption as food or drink, even including canned goods, is included under the law. It does not matter whether anything is manufactured or put up outside the State or in it. . . . . The most notable feature of the elections November 5 was the revolt of New York against Tammany misrule. Seth Low, the Fusionist candidate, was elected with a plurality of nearly 30,000, and the entire city Fusion ticket went with him. This means the downfall of Richard Croker, whose power over Tammany appears to be at an end. The State was generally Republican. Ohio went Republican, but apparently without gain; Iowa Republican with a big gain, Governor Cummins having a plurality of 90,000; Nebraska Republican with slight gain. Raw weather kept down the town and city vote, but the farmers turned out in the country districts in full force, though it had been feared that cold and snow would keep them at home. Democrats won in Virginia by more than 30,000 majority. The negroes did not go to the polls at all in many parts of the State, and there will be a decided falling off in the total number of votes cast. The failure of the negroes to vote is ascribed in part to the belief that their votes would not be counted if cast, and in part to fear that by voting they would assent to the endeavor of the Constitutional Convention to disfranchise them. The city of Richmond gave a Democratic majority of 5,000, a considerable part of which came from the region inhabited almost exclusively by negroes. Rhode Island, Connecticut and Pennsylvania went Republican, the machine politicians carrying Philadelphia. Crane, Republican, was elected Governor of Massachusetts over Quincy, Democrat, by about the same plurality as a year ago. The vote was heavy. In Mississippi, the only candidates were Democrats. . . . . A fire which started in a wholesale grocery store at Portland, Me., November 5, spread to adjacent lumber wharves, and caused a loss of $250,000.

ADMINISTRATION.—The Postmaster-General, in his forthcoming annual report, will ask for an appropriation of $6,000,000 for the maintenance and extension of the rural free delivery system. Fully 4,000,000 people are now served by the system, and 6,000 applications are on file for its extension to other communities. The encouragement which was given to the extension of the free rural delivery system under the Administration of President McKinley will be continued under President Roosevelt. In addition to the financial provision that is to be made for the new method of delivering mail to the remoter sections of the country, there is a strong prospect that the service will be placed under the civil service rules, and that the 5,600 carriers will be protected and retained in employment on the merit plan, and without regard to political influences. It will be several months no doubt before this will be done, but it is understood that the Civil Service Commission is already at work on the rules that will apply to the service. The fact that the rural carrier provides his own horse or automobile, as is the case in a few instances, requires a different examination from any other now in vogue. He is also expected to have an acquaintance with the region and the patrons to be served, and this makes necessary a more careful examination and a certain degree of specialization of the questions to be asked of applicants. . . . . Rear Admiral Henry C. Taylor, the coming chief of the Navigation Bureau, in a report submitted to the Navy Department upon the establishing of an immense naval station in the Philippines, estimates that the project will cost the Government $30,000,000, and perhaps $40,000,000. . . . . Lord Pauncefote, the British Ambassador, has notified Secretary Hay formally that the British Government accepts the American proposition relative to the Clayton-Bulwer treaty as basis for a new treaty. . . . . The State Department has received telegraphic advices from Turkey and Bulgaria stating that Miss Stone and Madame Tsilka were alive and being treated well. Nothing definite can be obtained respecting the progress of the negotiations which Consul General Dickinson is conducting with the brigands, except that they demand the full amount of the ransom fund.

PHILIPPINES.—General Hughes reports the complete surrender of the insurgents in the Island of Cebu, consisting of 450 men and 60 officers, with 150 rifles and eight brass field pieces. The pouring of troops into the Island of Samar is believed to have had a good effect on the Cebu insurgents, who had been wavering for some time. The malcontents kept up the conflict by saying that a majority of the American troops had left the Philippines. . . . . Affairs in the Island of Bohol are very unsatisfactory, and more troops will be sent there. . . . . A plot to massacre the American garrison at Moncada, Province of Tarlac, Island of Luzon, has been revealed and the conspirators arrested. Gen. Smith has ordered the deportation of Gen. Lukban, leader of the Samar rebels. In a fight near Catbalogan, Samar, recently a body of scouts under Lieutenant Gaujot killed 25 rebels, burned 175 houses and captured 5,000 pounds of rice and other supplies.

GENERAL FOREIGN NEWS.—According to reliable reports received from Gen. Warren, 600,000 persons in the province of An Hui and 300,000 in the province of Kiang Su, China, are on the verge of starvation, and the famine is spreading. The available funds are insignificant. The Chinese have contributed $37,500 and the foreigners $7,500. A committee of the consuls is being formed to aid the sufferers. . . . . The revolution in Colombia continues, the revolutionists meeting with considerable success. Yellow fever is epidemic in some sections of Colombia. . . . . The flooding of mountain streams in Sicily has caused widespread damage, and 11 lives have been lost. . . . . A disaster to the British forces occurred in the eastern Transvaal November 1 in which several officers were killed or wounded, and 54 men were killed and 160 wounded. . . . . France is making hostile demonstrations against Turkey, and has captured three ports on the Island of Mitylene. The Sultan has ordered the speedy completion of defences at Turkish ports and at the entrance to the Dardanelles, the laying of mines and the mobilization of troops. A strong anti-French feeling prevails at Constantinople. . . . . During a recent storm on Lake Baikal, Siberia, scores of fishing boats were destroyed, and 170 men drowned.

FARM AND GARDEN.—The annual convention of the New York State Dairymen's Association, to be held at Olean December 11-12, will be a very important meeting. The exhibit of dairy products and dairy machinery will be eliminated this year. The reason for this is that these products have been so fully represented, both at the Pan-American Exposition and the State Fair, that a further exhibition among the dairymen would impose an unnecessary tax upon exhibitors. This enables the Association to confine its energies to securing prominent speakers, and preparing a fine programme. The customary exhibition will be resumed next year.

The Missouri State Horticultural Society will hold its forty-fourth annual meeting at St. Joseph, Mo., December 3-5. A fine exhibition is expected, and there will be a complete and instructive programme.

The results in the model dairy contest of the Pan-American Exposition are announced by Frank A. Converse, Superintendent of the Live Stock Division, as follows: Greatest net profit in butter fat—Guernseys, margin of $4.66. Greatest net profit in churned butter—Guernseys, margin of $5.86. Greatest net profit in solids—Holstein-Friesians, margin of $26.14. Greatest gain in live weight—Holstein-Friesians.

O. E. Bradfute, the well-known Ohio breeder of Angus cattle and feeder of prime steers, will discuss beef cattle topics before the Pennsylvania Live Stock Breeders' meeting at Pittsburg December 18 and 19. Breeders in Pennsylvania and neighboring States should not fail to hear him and other authorities who will be on the programme.

E. H. Webster, a graduate of the Iowa Agricultural College, has been appointed chief of the dairy department of the Kansas Experiment Station.

William Gray Storrs, one of the most prominent and respected citizens of Painesville, O., and owner of large interests in the Storrs & Harrison Co., of which he was vice-president and general manager, died October 22. Mr. Storrs was born in Lapier, Cortland Co., N. Y., January 19, 1840. In 1854 he went to Lake County, Ohio, with his brother, the late Horatio Storrs, and his father, Jesse Storrs, who founded the Storrs & Harrison nursery. He was educated in the Painesville high school, and spent his early life there assisting his father in the development of the new enterprise. August 22, 1861, he enlisted in Company G, Second Ohio Cavalry, and served until September 17, 1865, when he was honorably discharged. The early part of his service was in the Western army at Fort Scott and at Indian Territory. He returned to Ohio in December, 1862, and recruited through the Winter at Columbus. Leaving April 6, 1863, he went to Kentucky and joined the Army of the Cumberland, operating through that State until Fall, when he went with Burnside to Tennessee, being among the first to occupy Knoxville. Later, engaged with Longstreet's forces in Virginia, he suffered many hardships. In April, 1864, he joined the Army of the Potomac, and in May was with Grant's army in the battles of the Wilderness, Spottsylvania and Cold Harbor. In August, 1864, Mr. Storrs became blind with erysipelas, and after much difficulty secured his removal to Cleveland, where he recovered. Then in December, 1864, he again joined his regiment and continued in the service until the close of the war. Mr. Storrs was held in the highest esteem by all with whom he was associated, and his untimely death is deeply regretted. He leaves a widow and four daughters.

The annual meeting of the Pennsylvania Dairy Union will be held at York, Pa., December 4-5. A number of prominent speakers will be present, including Dr. W. H. Jordan, of the New York Experiment Station; Prof. Voorhees, of the New Jersey Experiment Station; Prof. Hills, of the Vermont Experiment Station, and many others. Secretary, H. Hayward, State College, Centre Co., Pa.

End of the Dairy Test at Buffalo.

The great test of dairy cows at the Pan-American Exposition came to an end on October 31. The Guernseys won on net profits on butter fat, and also on the net profits on churned butter. The Holsteins won on total solids and also on gain in live weight. The margin of the Guernseys was very small, while the Holsteins in their classes had a good lead, thus proving themselves excellent general-purpose cows. We shall have the pith of the whole thing soon. The corrected figures for the full six months are given below:

	Butter fat.	Churned butter.	Total solids.	Solids & added weight.
Guernsey	$230.10	$220.37	$202.75	$208.60
Jersey	225.44	214.51	201.52	207.19
Ayrshire	217.68	212.91	235.70	242.24
Holstein	210.56	192.88	262.14	273.87
Red Poll	197.80	191.83	201.61	212.08
Brown Swiss	183.08	176.83	207.69	213.63
French-Canadian	176.34	181.81	182.76	191.40
Short-horn	172.84	164.77	205.67	229.73
Polled Jersey	169.44	160.59	145.38	153.63
Dutch Belted	116.94	111.96	143.66	154.94

Of individual cows a Guernsey made the largest individual profit on butter, making $59.40. A Red Poll cow was second, a Guernsey third, and a Jersey fourth. As we have mentioned before, butter was reckoned at 25 cents a pound and total solids figured at nine cents, while the gain in live weight was estimated at three cents.

Farm Conditions in Nebraska.

I live in the fertile West, where chemicals and fertilizers are unknown except those found in the manure pile, which is always accessible in the towns free of cost, and many even hire it drawn out into the country and dumped by the roadside. Yes, we raise clover here, but not to any great extent, but the acreage is increasing yearly. Prairie grass furnishes us our hay and pasture. Alfalfa is not altogether a success here. Our principal crops are corn and wheat. Cattle raising and feeding are important industries, also the raising of hogs. This is not a dairy country. We can and do raise some fine fruit here, in fact all kinds except those of the tropics. I notice in the article from C. E. Chapman that he has an idea that we, in the West, are "in the mud" most of the year. I want to say that we are not bothered in that respect in Nebraska. Few farmers are compelled to wait longer than a day after the heaviest rain before back again in the field. As to roads, we do not need any crushed stone, as our soil packs hard when traveled upon for any length of time, and any farmer's team can haul from 2,000 to 3,000 pounds to market easily. I believe in the theory of "a little farm well tilled," and that the *intensive* and not the *extensive* farmer will be the prosperous one in the end. C. V. D.

Tecumseh, Neb.

Milk Prices.

The New York Milk Exchange has raised the price to the producer to three cents per quart. This is the same as last year, but the increase then was made the last of September. This price is usually called net to the producer in the 26-cent freight zone, but there are other items which must be deducted, such as ferriage and expenses at receiving stations where such charges are made. November prices at eastern condenseries are a trifle higher. At Middletown and Johnsons it is nine cents per can more, and at Walton four cents, while at Elgin, Ill., the price is the same as that of the New York Exchange, and for the year it averages one-fifth cent per quart less than at the highest eastern condenseries. The Philadelphia Exchange price is four cents per quart, from which an average of one-half cent freight must be taken.

CALIFORNIA has a boom in sales of vegetables to the Middle West this year. The drought cut the crop short in a large section of this territory, which ordinarily produces most of its own vegetables. The potato crop in the vicinity of Sacramento is large, and shipments are now being made to Kansas, Missouri, Colorado and Texas. The onion crop of California and Oregon is large, but the demand is heavy and prices are advancing.

THE QUAKER IDEA OF HONESTY.—An item in your issue of November 2 on editorial page arrested my attention yesterday, and I thought your attention ought to be called to it. The point of the article is to warn farmers against swindlers who try to get money from them by pretending to want to buy their farms at fancy prices. This is right, but in the case noted the act of the farmer in breaking his agreement to sell was a much more venal act than the other. As it reads, because he was offered more money over night he deliberately concluded to break his contract, made in good faith (as far at least as the farmer then knew or believed), probably intending to take advantage of the fact that it was a verbal agreement only, not in writing or under notarial seal, that the other was a stranger to the neighborhood, and would not be believed before the farmer's friend, Squire ———, etc. That he had to lose $1,500 was the result of *his* doing a wrong act, not the swindler or his friend. Your article says naught of this and in no way censures the act. That this should go out to your thousands of readers as having your editorial sanction I can hardly believe you intend. It seems to me it was a case of the biter who was bitten, and in no way is the farmer entitled to any sympathy. I am a farmer, and also in the real estate business, and here in Pennsylvania among us Quakers, a man who would refuse to sell after a contract was made verbally or written because he had a better offer, would be ostracised, as he ought to be. Whatever it may do for New York, it would not do here, neither, as "said Jno. P. Robinson he, that ain't the way they did down in Judee." It is a bad example for my four boys or any other man's boys who read it. SAMUEL C. EASTBURN.

Pennsylvania.

Woman and Home

From Day to Day.

HELP FROM ABOVE.

The little griefs, the petty wounds,
The stabs of daily care—
"Crackling of thorns beneath the pot"—
As life's fire burns—now cold, now hot—
How hard they are to bear!

But on the fire burns, clear and still;
The cankering sorrow dies;
The small wounds heal; the clouds are rent,
And through this shattered mortal tent
Shine down the eternal skies.

—Dinah Mulock Craik.

*

MACHINE stitching in silk of a contrasting color is again seen on shirt waists and millinery trimmings. A waist of black taffeta stitched with white had both front and sleeves tucked half way down, and the back had four tapering tucks, all being stitched with white. Cuffs and stock were also stitched with white. A white cloth waist with red stitching was another very pretty model.

*

LAST Summer a Kansas newspaper solicited cooking recipes from a number of prominent women, and among them was Mrs. Roosevelt, who sent her recipe for spice cake. Here it is: One cupful butter, two cupfuls sugar, one cupful milk, four eggs, four cupfuls flour, two teaspoonfuls baking powder, one tablespoonful ground cinnamon, half teaspoonful nutmeg. A good recipe, and one that will be appreciated by others as much as by the White House family.

*

JUST at present there is quite a rage for Indian bead work, but much that is now made simply to supply this fad is very coarse and common in design. The older or more painstaking work is really handsome. Bead belts fastened with silver clasps are seen. There is an increasing taste for the domestic manufactures of the American Indians, pottery, baskets, carving, woven fabrics and embroideries are all making their appearance in city stores, and their picturesque qualities are being impressed upon people of taste. They certainly deserve equal recognition with the aboriginal work of other lands.

*

RUSSIAN drawn work, now coming into favor here, differs from the Mexican in having embroidery over the drawn threads, often very elaborate in effect. Russian lace, which is heavy, usually of gray or twine-colored thread, has been used freely during the past year as a dress trimming. This is made on a cushion, with needle and bobbin, the patterns being rather medieval in effect; sometimes gold threads are introduced, making a very rich trimming. This lace used to be made entirely in Russian convents, but now instruction is being given to women and girls of the peasant class and remunerative employment thus provided for them.

*

IT is believed by the average man that whenever a woman essays a bit of carpenter work, she selects as her tools a flatiron, a hairpin, or a broomstick, in preference to all the conveniences a tool chest may display. Her confidence in these accustomed tools is doubtless the result of familiarity; that it is not misplaced is evidenced by the recent experience of a 15-year-old girl, who vanquished a burglar with a flatiron as her only weapon. She did not throw it at him, thereby, perhaps, preventing damage to the adjacent furniture, but she put the burglar through much the same process as the weekly wash, to his exceeding discomfiture, and was left victorious on the field of battle.

SUCH a multitude of pretty stocks is seen now, and they are easily made by anyone with a bit of knack. We prefer to build these upon the ready-to-wear stock foundations, either of crinoline and featherbone, or of milliner's wire; they hold their shape better than one made from collar lining, and are not so thick. A great many stocks are black and white, some of the newest being of white silk with turnovers of black velvet. These, however, are prettier when viewed in the shop than when worn, for few women really look well with the black next the skin; the sharp contrast is likely to bring out unbecoming lines. On the other hand, a black velvet stock with little white turnovers is almost universally becoming. A white silk stock having a black velvet tie brought around from the back, and tied in the front in a four-in-hand knot is very pretty; so, too, is one with the tie ends passed horizontally through a buckle, and terminating in a little loop. Small strass or rhinestone buckles, such as have been used on hats, form a frequent decoration for stocks.

The Rural Patterns.

Norfolk jackets and waists are now very fashionable, and they make a pretty and becoming style. The jacket shown is of black camel's hair cheviot, with smoked pearl buttons, and makes part of a costume, but the design is suited to separate wraps also. The back is snug fitting and includes a center seam that is curved to the figure, the fronts are fitted by single darts which are concealed under the applied pleats. The pleats are graduated in width, so producing a tapering effect at the waist and are applied over the jacket. The belt, which is merely an ornamental feature, passes under those at the back and terminates in pointed ends over those at the front, and can be omitted when the jacket is preferred plain. The yoke is pointed and the neck is finished with a regulation collar that rolls over with the fronts to form lapels. The sleeves, in coat style, have flaring pointed cuffs that open at the back. To cut this jacket for a woman of medium size 5½ yards of material 20 inches wide, 2⅜ yards 44 inches wide or two yards 50

3964 Norfolk Jacket,
32 to 40 Bust.

inches wide will be required. The pattern No. 3964 is cut in sizes for 32, 34, 36, 38 and 40-inch bust measure; price 10 cents from this office.

A girl's Norfolk shirt waist, as figured, is becoming to slight or unformed figures. The original is made of velveteen in a black and white shepherd's plaid; but flannel corduroy, and all the season's waist cloths are equally appropriate. As shown, the waist is made over the fitted foundation, but can be left unlined when preferred. The lining is simply fitted, and terminates at the waist line. The fronts and back of the waist are smooth at the upper portion, but drawn down in gathers at the waist line. The box pleats are applied, stitched at each edge, and are graduated in width to give a tapering effect to the figure. The yoke is cut in points, that

3963 Misses Norfolk Waist,
12 to 16 yrs.

are stitched flat over the pleats, and the neck is finished with a novel collar that matches it and the cuffs. The sleeves are in bishop style. To cut this waist for a miss of 14 years of age 3⅝ yards of material 20 inches wide, three yards 27 inches wide, 2¼ yards 32 inches wide or two yards 44 inches wide will be required. The pattern No. 3963 is cut in sizes for misses of 12, 14 and 16 years of age; price 10 cents from this office.

A Photographic Competition.

PRIZES FOR PICTURES OF HOUSEHOLD SUBJECTS.

The Woman and Home Department offers the following prizes for the best pictures illustrating domestic subjects:

First Prize, $7.00
Second Prize, $5.00
Third Prize $3.00

The subject should illustrate, preferably, some idea of convenience, comfort, or saving of labor, but domestic episodes which form effective pictures will be considered. We desire photographs that show something, but that will also make attractive pictures. The prize winners will be asked to furnish descriptive notes to accompany the illustrations. The competition will be open until December 1. In addition to the prize-winners, other pictures which, though failing to receive a prize, are still considered worthy of use in illustrating, will be paid for upon use at our regular rates. Address all matter relating to this to the Woman and Home Department of THE R. N.-Y.

REMEMBER your own soul must be illuminated before you can help others: the spring does not brim over with refreshing water that has not a hidden source.—Light on the Hidden Way.

What Shall I Give for Christmas?

Whatever you choose. You can easily earn the money to do it with before Christmas comes.

THE LADIES' HOME JOURNAL and THE SATURDAY EVENING POST, of Philadelphia, will show you how, and will give you all the help and advice you need.

No guesswork or chance about it. It is as sure as it is easy.

Money Making on the Farm.

A New England Worker.

I was interested in the paragraph about the New England girl who wishes to earn money at home, and I think it possible that I may give her some hints. Conditions and individuals differ so widely that it is impossible to lay down any hard-and-fast rules. A girl situated like the one in question must use her eyes and her brains, plan carefully and work conscientiously. She must not expect to make much money at first, but if she does good work, at something people want, and sticks to it, she must succeed in time. Two things I would recommend her to do at the outset: keep strict account of all expenditures and receipts, and leave any false pride she may have, in some out of the way place where she won't be able to find it. I think the experience of another New England girl may be suggestive to others who are situated like the one spoken of in THE R. N.-Y. What I am going to tell about her is just as it happened.

She began in her early teens to do all the housework, excepting the washing, for a family of four, and a part of the time five. She had a small allowance, and as she was not over strong at that time it was several years before she tried to earn any pin money. She was one who had a good many fads, and one of these was writing stories for amateur papers. Finally she tried sending things to professional papers, and after some discouragement she began to sell now and then a manuscript. She kept this up till at length she earned enough with her pen to pay all her personal expenses and have some money left over for extras. Now I don't want to be understood as advising every girl to go to writing stories. Not every girl has a liking for that kind of work, and not every girl would be willing to spend most of her spare time for three years in writing, before getting a cent in return, as did this girl. This merely shows one way, and that it takes patient work to bring results. While writing was her main dependence, she had other strings to her bow. She had always been very fond of flowers, and she had good success with them. She studied their needs and fussed over them, and they responded. One Spring she bought a small Begonia at the greenhouse, kept it through the Summer, repotting it once, and sold it for 15 cents more than she paid for it. The next year she had an order from a friend to start a dozen plants for Winter, and she sold a handsome maidenhair fern for a good price. She also raised about 50 tomato plants for home use, and they were so fine that she could have sold them all and as many more if she had had them.

Then she liked to cook. She made very good sponge cake and molasses cookies, and by letting people know of it, she got a few orders for these. She put up more than 100 quarts of tomatoes one year, and sold a good part of them at 20 cents a quart, including jars. One season she made butter. She was very careful and painstaking to have it good, and it sold readily. When it happened that there was anything on the farm that would go to waste, such as fruit or vegetables, and she had the time and could have the horse, she left her pride at home and peddled them out to her friends at the village. She gathered things like peas and green corn just before starting, with the result that next year all her friends urged her to plant a good many peas, because hers were so much better than any they were able to buy elsewhere.

While all these things, except the writing, brought in very little money, there was no reason why each one might not have been developed into a paying business if she had felt like giving up the others for it. She also saw other opportunities which she could not attempt, one of which was taking in washing. If a girl is strong and can have things conveniently arranged, she can make good pay by washing, only very often pride stands in the way, and it is forgotten that any necessary work which is well done is worthy of respect. I know of a case where a woman declared she could earn more money and earn it more easily by washing than by working in the factory, and she made good wages there. It would seem that the girl I have been writing of had enough irons in the fire, but her friends have urged her to try other things, such as bees, Belgian hares, Angora cats, geese, sheep, peacocks, boarding old people, taking Summer boarders and boarding State and town children. No one has suggested dressmaking, or millinery, because it is known that her tastes do not run in these directions, but she has a standing order for a yard of knit lace whenever she has the time to make it.

If a girl is about to go into the business of earning money at home, she wants first to select some work that she has a taste for, so that it will be a pleasure, and not drudgery. Then she wants to figure out just where the profit is coming in. If she is going to make cake, for instance, she must reckon up the cost of the materials and fuel, then add a fair amount for her time; then if she finds she cannot get her price for the finished product she would better keep out of cake making. It will be much better if she can sell direct to the consumer; middlemen do eat up the profits so. It may not be as pleasant, and she may dislike to advertise her goods, but she will soon get used to it. The most important point is to have the product always the same in quality, and always the best of its kind. Good, conscientious work is always in demand, though one may sometimes have to work to find those who want it, and may even have to go to considerable pains to convince them that it is faithfully and well done.

DOROTHY BARTLETT.

Poultry Farm and Garden.

The case of the young girl who wants to earn money, but who is obliged to stay at home on the farm to help her mother, is one of interest. Thousands of girls and women are situated in just such circumstances. Thousands more have left the farm, for whom it would have been far better had some duty compelled them to stay. The editor well says that "it ought not to be necessary to leave the country in order to obtain money with which to gratify a few simple and honest desires." It is not necessary. There are better opportunities to earn spending money right at home without sacrificing liberty and individuality than in the city. The editor wants only things which have been done, but some things can be done which have not been, or at least some things can be done by such a girl which have not been done by other girls, but which have been done by other people. One of the most natural ways for earning money under such circumstances is in poultry-keeping. Any girl who has a taste for poultry can obtain considerable spending money by intelligent management. If poultry is already kept on the farm and the income goes to Father, let her prevail upon him to give her 25 per cent of the gross sales in return for her care and management, he furnishing the feed. I know one young woman who gets this percentage, so at least that much of this suggestion has been done. Certainly many other women keep hens and make some profit from them.

Here is another suggestion, though perhaps no girl has done it. Yesterday I visited a little grapery where a minute insect had nearly ruined the crop this year. This was discouraging, but the insect had been met and conquered by others before, and can be as easily conquered in this case. The grapery was not large, yet the owner said that they should have obtained 600 or 800 pounds of grapes from it. This was a cold grapery, requiring no expense for heat. It did require some capital to put up the building, which would be a hindrance in some cases, but not in all. Near any good-sized village these grapes would find ready sale at paying prices. If the home market were unavallable growing grapes in heated houses for shipment to New York or Boston might be preferable. I know of no young woman who has done this, but I do know of graperies which yield excellent returns, and the product from one house would give such a young woman more spending money than she could earn behind the counter with many times the number of hours spent that would be required in caring for the crop. I do know one young woman who manages a little greenhouse filled with flowering plants who secures some spending money in that way. I know many greenhouses not managed by women which yield considerable money to their owners. I know no reason why these could not be managed by a woman as well as they are by a man.

If none of these things seems attractive, Father might be prevailed upon to turn over some one field or part of a field to her use, with the definite agreement that whatever she could produce upon that land should belong to her. Then let her begin to study the possibilities of that field. With pencil and paper let her carefully figure what might be produced upon it, getting advice from Father and others as to the cost of labor required and all other expenses. Then let her add a liberal allowance to these expenses, and carefully figure the probable returns. Let her not be satisfied until she has studied many possibilities. She ought to find something which would yield a profit after paying for the labor and the expense of growing. I should like to see a hundred young women try such an experiment and report their results. Women have made money from land, as the columns of THE R. N.-Y. will testify; other women can do it. If this young woman can leave home long enough, let her take a short course in one of our agricultural colleges, like those offered at the Rhode Island College for the coming Winter. If she cannot do that, let her take a correspondence course, as several women are doing in our own school of correspondence. By means of such study, I am sure that any bright, pushing, young woman can find ways to make a very satisfactory amount of pocket money without leaving home.

☞ Please tell what you wish to purchase.

BUSINESS BITS.

CUTTING the year's wood supply is quite a task if it must be done by hand work. A circular saw to be run by horse power or engine is inexpensive, and any farmer can do enough work for his neighbors to pay for an outfit the first season. Write to Ross Bros., Worcester, Mass., for prices and full description of the saw advertised in this issue.

To the unobserving it is a revelation to note the tremendous strides such catalogue houses as Marvin Smith Co., of Chicago, are making. Their goods are carried on almost every train that runs out of Chicago, and every town and village in the country receives some of these goods. Theirs is a business policy that others would do well to imitate. Fair, square treatment always, is doing the work for them.

MANY years ago the popular way to sell farm and household implements was through the large jobber; the jobber to the wholesale merchant and he in turn to the retailer. Just see all the different profits that the consumer must pay! Now many manufacturers sell direct and the consumer gets the benefit of a large portion of the savings. If you want a good range don't pay the high prices asked by your hardware merchant or traveling agents, but write to Hapgood Plow Co., Alton, Ill.

OUR readers will note the advertisement of the Star Manufacturing Co., New Lexington, O., which appears on another page. It will be observed that these people are manufacturers of sweep and belt power feed grinders. Their two-horse short sweep crusher and grinder is well known as a highly efficient machine, and is widely used in all sections of the country. Indeed, it is looked upon as being one of the most successful mills of its class on the market. Their large power mills are of equal merit and superiority. Write them for their booklet "Feeding Live Stock."

THE progressive farmers and stockmen in all parts of the world are feeding cooked feed, thus getting every possible ounce of nutriment out of it. In years when there are great quantities of feed and the price is low, the stockman can be in a measure excused for not going into these matters carefully, but it is imperative this year that we close all avenues of waste. The Rippley Hdw. Co., Grafton, Ill., is making a feed cooker that we think you ought to know about. The entire cooker, except the smokestack, is made of galvanized boiler steel and will last almost a lifetime. The Rippley people absolutely guarantee this cooker to do all that they claim for it, or money refunded. It can be moved anywhere, it can be used outside, or be attached to any flue; it will burn wood, coal, cobs or coke. We trust that all our readers who are interested in cookers will write to the Rippley Hdw. Co., Grafton, Ill., and receive one of their new twentieth century catalogues, which are sent free.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal". See our guarantee 8th page.

WANTED

No. 2 and Clover Grades of Hay.

F. D. HEWITT,

120 Liberty Street, New York.

Wants, For Sale or Exchange

WANTED—Farmers and Dairymen, $30 to $50, with house or board. Only competent men with good references. The Rural Agency, Durham, N. H.

Fine Farms and Orchards in the great Piedmont Fruit, Grain and Stock section of Virginia. Elegant water and climate, with best educational advantages, and near great markets. For further information address JOHN L. McCUE, Afton, Va.

Cash for Your Real Estate no matter where it is. Send description and cash price and get my successful plan for finding cash buyers. W. M. Ostrander, North American Bldg., Philadelphia. See my full page ads. *Munsey's*, *McClure's*, and all the big magazines.

"I OWN MY HOME."
That's what puts nerve and backbone into a man. We sell them on the easiest terms. More than a hundred to choose from in our Illustrated Real Estate Catalogue Mailed free Write to-day.
W. F. Allen Land & Imp. Co., Salisbury, Md.

WANTED—Man and wife for farm in Rockland County, N. Y. Man must be practical farmer; wife must be a neat, clean housekeeper, and do the housework. Write, giving age of each and experience in fruit culture, stock and general farming, with reference as to character and ability. Those using alcoholic liquors must not apply. State wages expected. A. ROSS MATHESON, 37 Seventh Avenue, Brooklyn, N. Y.

FARM PROPERTIES.

Missouri Farms for Sale.

I have a large list of farms for sale in Vernon and Bates counties at $20 to $40 per acre; nice lying country; just as good as Iowa or Illinois; good climate; good water; am a farmer; born in Fulton County, Ill., and have lived 38 years near Prairie City, Iowa. Come to my house and I will show you my list of bargains free of charge, and will sell you land at owners' prices. For price-list and particulars write and inclose stamp to A. F. WILSON, Real Estate Agent, Stotesbury, Mo.

GLENN RANCH,

Glenn County, California,

FOR SALE IN SUBDIVISIONS.

This famous and well-known farm, the home of the late Dr. Glenn, "the wheat king," has been surveyed and subdivided. It is offered for sale in any sized government subdivision at remarkably low prices, and in no case, it is believed, exceeding what it is assessed for County and State taxation purposes.

This great ranch of 40,000 acres runs up and down the western bank of the Sacramento River for 15 miles. It is located in a region that has never lacked an ample rainfall, and no irrigation is required.

The river is navigable at all seasons of the year, and freight and trading boats make regular trips.

The closest personal inspection of the land by proposed purchasers is invited. Parties desiring to look at the land should go to Chico, California.

For further particulars and for maps, showing the subdivisions and prices per acre, address personally or by letter,

F. C. LUSK,

Agent of N. D. Rideout, Administrator of the Estate of H. J. Glenn, of Chico, Butte County, California

Barns of Plank save Timber and cash. Best, cheapest, strongest; 4,000 in use. Book for stamp. SHAWVER BROS., Bellefontaine, Ohio.

Architect Johnston, Newport, R. I., furnishes complete plans and specifications for buildings of all kinds. Write him.

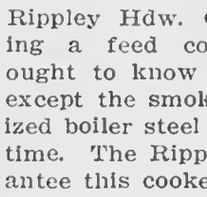
Do You Wear Rings?



No. 77.

Perhaps you would like one to use as a holiday remembrance to some friend. We have been able to make arrangements with a manufacturing jeweler by which we can furnish handsome rings with stone settings at surprisingly low prices. These rings are rolled gold, with a five-year guarantee. We offer four styles. No. 77 is a single stone. You can have any color stone or any size ring. Price, 25 cents. No. 81 has three stones, Tiffany shape; you can have any combination of colors, and any size ring. Price, 40 cents. No. 79 is a three-stone baby and misses' ring, any combination of colors, and any size. Price, 25 cents. No. 66 is a cluster of imitation diamonds with center stone, which may be had in any color. Price, 75 cents. No. 55 is an Egeria diamond scarf pin. This is a gold-plated pin on German silver, which gives a high finish. The setting is new and gives a pretty effect. Price, 25 cents. We will send any one of these rings or the pin as a reward for one new subscription at $1, except No. 66. We will send this for a club of two new subscriptions, or with one new and 25 cents extra. Select ruby, sapphire, emerald, opal, turquoise or diamond. Measure size of finger carefully with narrow slip of paper, and send this with order. The rings are sold only to subscribers or their families.

THE RURAL NEW-YORKER, NEW YORK.

10 Weeks for 10 Cents.

Here is the kind of letter we are getting these days:

I have been a reader of your paper a short time only, but must say that it is my choice of the six agricultural papers I am now taking. Please send me terms and some samples to distribute among my friends. I cannot take much time from my business, but can get perhaps a few subscriptions. I can recommend your paper to everyone. B. W. A.
Albion, N. Y.

This is the kind of friends that help us most, because there are hundreds who can send a few names of neighbors and friends where one feels like starting out to raise a big club and work for a prize. This makes it all the easier for those who can take the time to work for the prizes. We again appeal to every reader for some little effort towards that 20,000 list of new trial subscribers, if it be only one name and one dime. We will send samples and supplies promptly on request.

THE RURAL NEW-YORKER,
NEW YORK.

Canning and Preserving.
Country Roads.
Memory Training.
Fruit Packages.
Chemicals and Clover.

THE RURAL NEW-YORKER,
409 Pearl Street, New York.

MARKET NOTES

CRANBERRIES.—The Long Island crop is now being marketed. It is said to be unusually large and of good quality. Some estimates put the yield at nearly 1,000,000 bushels. November is the great month for shipping cranberries, and the retail trade continues heavy until after New Years. Present wholesale prices range from $4.50 to $6.50 per barrel. These figures are exceeded in certain brands of selected berries. Some of these sell as high as $10 per barrel, but a general quotation of this figure would be misleading.

BRUSSELS SPROUTS.—A reader asks: "In what shape are Brussels sprouts marketed, on the stems or picked from them? Are they sold by measure or weight, or at so much a stem? What is the usual price? I find the little heads infested with a gray louse. Is there any way to get rid of them?" Brussels sprouts offered in this market are picked from the stems and sold by the quart. Most that I have seen have been packed in quart baskets, in crates similar to those used in shipping strawberries. Packed in this way they reach the market in better condition than if shipped in boxes or barrels, and are in convenient form for retailing. The price is usually high enough to pay for a little extra work in marketing, ranging from four to 10 cents per quart. The demand for sprouts is light, and it is probable that no extensive trade could be worked up in them, as they are more expensive than other greens, and but few people prefer them to spinach or cabbage. There is no effective way of getting rid of the lice that are on the crops at harvest time. They might have been cleared off with a spray of whale-oil soap, four ounces to a gallon of water, but of course this must be applied long enough before harvest to give the rains an opportunity to wash off the offensive soap.

THANKSGIVING POULTRY.—For this trade prime turkeys of medium weight are most desired. Chickens sell well if of good quality. Scalded poultry is all right if the weather happens to be cool and dry. In damp, muggy weather, however, it gets sticky and is hard to sell, so that dry picking is preferable. In preparing for shipment it is well to make separate packages of the prime and second quality; or rather it is better to send only the prime and let the others live for two or three weeks. Where any large quantity is sent the best plan is to keep the hens and toms separate. Any extra attention given to the packing in order to make the shipments appear well when opened is usually well paid for. This is more important than most people think. It often happens that a buyer merely looks at a lot of poultry and passes it by on account of the rough manner in which it is packed, and pays a higher price for another lot which is of no better quality, but has been neatly put up. Any poultry that is fit to send to market is worth a reasonable amount of care in preparing it for sale. It is useless to make any prophecies as to prices, as no one can tell whether there will be a surplus or a shortage. If the former, the second grade poultry is what will suffer most, and there is but little danger of prime lots being left over, if received in time, or of being sold at a sacrifice. All stuff intended for Thanksgiving trade should be here not later than Monday of that week, November 25, and the latter part of the previous week would be better. Retailers stock up the first of the week, and late arrivals are likely to be left over unless there should happen to be a scarcity.

W. W. H.

5 for $4 Send us a club of four subscriptions with $4 and we will advance your own subscription one year free. New yearly subscribers will now get the paper from the time subscription is received until January 1, 1903. Get up a club at once.

VALUES OF FARM LANDS.

Falling Off in Connecticut.

So far as I can learn the value of farm property is not over one-half what it was 20 or 25 years ago. The reason I don't know, unless it is because the young men think they can do better at some other business. Some of them go to the nearby cities for employment. One farm about a mile from Cheshire center sold about 25 years ago for $18,000 has changed hands this year at $10,000. This perhaps is as valuable as any farm in town. As to my own, that is of another sort, it being carried on as a market garden. My son has managed it for several years past, built greenhouses and expended considerable money one way and another. Probably the sales are double what they were a few years ago. In Colchester, Conn., the Hayward rubber mill kept business up there until absorbed by the trust. Since then things have gone to the dogs fast. Few young farmers there; natives nearly all dead, and the Jews have possessed themselves of some of the best farms in town, and also Salem, adjoining town south. It takes all the heart out of a man for making any improvement on his place if his heirs are not likely to receive benefit from it. P.

Cheshire, Conn.

The Change in Pennsylvania.

Farm lands of the same productive capacity and equally as good improvements, would sell now about the same as 15 or 20 years ago. We are in the midst of the Connellville coke region. Coal is nearly all in the hands of companies who are working it, while the farmers own only the surface. Some farms are injured by surface falling in, some by the water supply failing, and others by too close proximity to the works. With these exceptions the land is as productive as ever, where it is properly cared for. Crops are good, and we have an excellent market for everything right at home. Some of the best farms of 20 years ago have passed from father to son, and have run down, and the sales are probably less than then. Others quite unproductive then and considered thin and poor, by the enterprise of their present owners have been very much improved, until they are now the best and most productive that can be found. I think it is only this latter class that have increased in agricultural value. As to my own farm, I claim it belongs to this latter class, but as I have only 40 acres, and am engaged principally in fruit raising and market gardening, the sales from it and the selling value of the land would hardly be a fair answer to the question. T. H. S.

Dunbar, Pa.

A Letter from Ohio.

I think if we take into consideration quite a scope of land about here that it will average $10 to $20 an acre less than 20 years ago. The poor price of wheat, generally, has had more to do with the depreciation than any other one thing. I think, though, that there is a tendency now to advance a little. As to my own place and all such little fruit and truck places about this town, there has been a great deal more of a depreciation than I speak of, because of the lower price of cabbage, strawberries, raspberries, blackberries and truck in general. This is a great shipping point for all of those things as well as the larger fruits and grains. We have a great variety of soils, but I cannot say that the price of any of it has increased in the past 15 or 20 years. My main efforts are at fruit and poultry raising. We have one of the largest sections interested in capon raising that there is in the United States. I caponize about an average of 9,000 per year around here, besides dozens of others doing various numbers. H. B.

Clyde, O.

SWEET POTATO FLOUR.

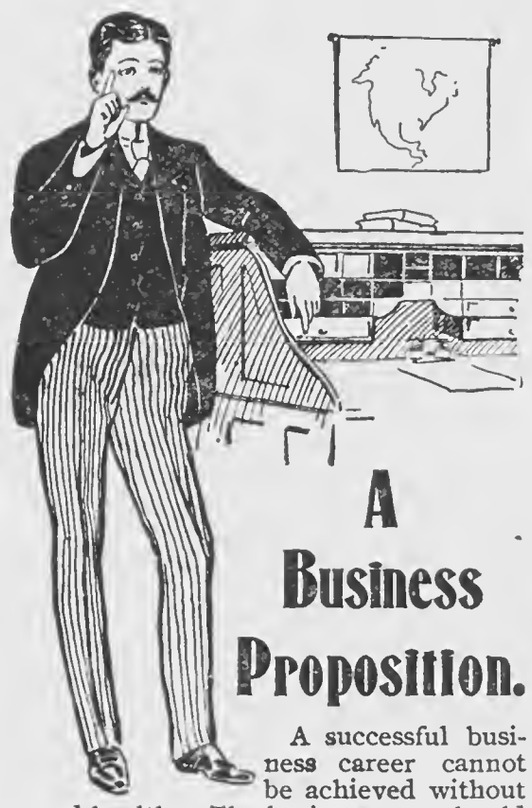
From time to time during the last year reports have appeared in various papers regarding the manufacture of sweet potato flour at Vineland, N. J. We recently visited the plant, and were given the following statements by the manager, Henry S. Morris, who represents the American Flour Co., capitalized by Philadelphians:

The manufacture of sweet potato flour was begun early last Spring from small sweet potatoes which had been bought and stored for the purpose the Fall before. The process of manufacture is not given to the public, but the statement was made that 500 barrels of the flour were made in two months, and that it takes only three hours to complete the process. On examination the flour proves to be fine, dry and of a slightly yellowish color. It has a sweetish rather pleasant taste, reminding one of the raw sweet potato. The wholesale price is $5 per barrel of 200 pounds, and it retails at three cents per pound. Nearly all of the flour made was used in the large confectionery establishments, but a portion went to the grocery trade. We were told that it could be blended with other flour in the proportion of 25 per cent for bread making, etc., but on further inquiry among those who have used it, and on trial ourselves, we conclude that a 10 to 15 per cent mixture is more satisfactory. Thus mixed it is especially recommended for griddle cakes. No particular attempt has yet been made to put it on the general market, but it is contemplated putting it up in packages for grocery trade as soon as the supply will warrant it.

We were told that the company was putting in $10,000 worth of new machinery and expected to make several thousand barrels of the flour the present season. They are now buying small sweet potatoes in large quantities, for which they pay 50 to 60 cents per barrel, the same as the canning factories pay. We were not told how many barrels of sweet potatoes it took to make a barrel of flour, but by reference to "First Principles of Agriculture," by Prof. Voorhees, we find that the raw sweet potato contains 27.6 per cent solids, and the flour contains 88.67 solids. Thus it would appear to take 321 pounds of sweet potatoes to make 100 pounds of flour, or about 4½ barrels of potatoes to make one barrel of flour. From the analysis of the sweet potato however, we find that it contains 1.1 per cent of protein, .3 per cent fat, 1.3 per cent ash. If there was no loss this would give us in the pure product of flour, 3.53 per cent protein, nearly one per cent of fat and 4.17 per cent ash. The loss of protein and fat may be accounted for, but what has become of the ash? Can this be accounted for in the waste of the thin skin which is removed?

We are glad to record the establishment of this new industry, as it will help to extend the market for one of our great National products, and especially forms an outlet for the smaller sweet potatoes, which are often difficult to dispose of except as feed for stock, and by this process of preserving them in a concentrated form, they can be kept for an indefinite period, and shipped anywhere without fear of loss. This company is also making a vegetable coffee composed of six different vegetables, which they expect to put on the market soon. We were given a sample for trial. It has a rather rich and pleasant flavor, and no doubt will be welcomed by those who cannot use ordinary coffee.

Cumberland Co., N. J. F. S. NEWCOMB.



A Business Proposition.

A successful business career cannot be achieved without sound health. The business man should guard his health as he guards his capital; for health is part of his capital and the impairment of that capital affects every business interest. A sedentary occupation and quick lunches, soon show their effects in a sluggish liver. The use of Dr. Pierce's Golden Medical Discovery will cure "liver trouble" as well as indigestion and other diseases of the organs of digestion and nutrition.

The "Discovery" strengthens the body by supplying Nature with strength making materials. It contains no whisky, alcohol or other intoxicant.

"After three years of suffering with liver trouble and malaria," writes Mr. Edward Jacobs, of Marengo, Crawford Co., Indiana, "I gave up all hopes of ever getting stout again, and the last chance was to try your medicine. I had tried all the home doctors and received but little relief. After taking three bottles of Dr. Pierce's Golden Medical Discovery and one vial of his 'Pleasant Pellets' I am stout and hearty. It is due entirely to your wonderful medicines."

Dr. Pierce's Pleasant Pellets assist the action of "Golden Medical Discovery."

A FEW PLAIN FACTS
On the Curability of
Consumption, Asthma and Bronchitis.

From Dr. Robert Hunter's Lectures on Lung Diseases.

I have made the lungs a specialty for nearly fifty years, and know by experience that Consumption is curable in all stages. By this I do not mean that it is curable in every case, for in some the patient's constitution is so bad and broken down that no healing power is left in the body. But treated in its early stages, fully 95 per cent recover under antiseptic medicated air inhalations.

But the mere act of inhaling some fragrant nostrum is not what I mean by inhalation treatment. The remedies must be adapted to the disease and condition of each patient. The physician must have thorough knowledge of medicines, be able to detect the different forms of lung disease and have experience in the action of inhaled remedies on the lungs or he can not apply it with success.

Consumption, to have the same chance of cure as other diseases, must be treated before serious injury has been done to the lung structures. Almost every case is seen in this stage by the patient's family physician, and, if he knew the remedies to use, their strength and how to apply them to the lungs, there would be few deaths by consumption.

But what possible chance has any one afflicted with consumption under the care of physicians who never cured a case in their whole professional career, who confess that they have no curative treatment of their own, and no confidence in anything they can do for the disease? What moral right have they to treat consumption at all, or to permit their patients to believe they are striving to cure them when all they are doing is but a wretched system of palliation of symptoms?

Here is the real cause of this widespread mortality of Consumption. People die of it because general physicians do not know its proper treatment and are wholly incompetent to cope with it. Before they can do so they must be retaught the principles of medical science which govern the treatment of all local diseases, and, acting under them, must discover, as I did, the remedies, which, when locally applied to the lungs, will kill the germs and heal the ravages they have made in that organ.

I have given to the world a positive cure for Consumption in my Antiseptic Medicated Air Treatment, when applied before mortal lesions have taken place. It is a treatment which places Consumption in the list of curable maladies and renders their cure certain as other serious local diseases. By it healing and germicidal remedies are brought into direct contact with the internal surfaces of the nose, throat, larynx, air tubes and cells of the lungs. It soothes the mucous lining of the breathing organs, arrests irritation and prevents inflammation, while the antiseptics destroy the germ life on which the disease depends.

Readers mentioning THE RURAL NEW-YORKER can obtain Dr. Hunter's book, "The Lungs and Their Diseases," absolutely FREE by addressing Dr. Robert Hunter Association, 117 W. 45th Street, New York City.

DAIRY AND FARM NOTES.

The Breeds of Dairy Cattle.

BEEF COWS.—Another point which the larger breeds possess to their advantage; in case of accident to the udder, partially or wholly destroying their usefulness in the dairy, they have a value on the block. I am not advocating the impossibility of an animal capable of large milk returns and a fancy beef possibility at the close of a milk-making career, but I would prefer a cow weighing in her milk-making form from 1,000 to 1,100 pounds. I think breeders have come to recognize that profit lies in the medium animal. We all know that some phenomenal producers have been both undersized and very large. But when we study the everyday working power of large herds we see at once that it is the medium cow with strong constitution and good digestion that stands up under hard work. It would seem that the previous explanation of neither overfeeding, producing rapid and excessive growth, overtaxing the digestion, or scanty food supply resulting in a weak assimilative power, would give us sufficient reason why these medium-sized animals are the profitable ones. Their digestion and constitution are not impaired by the extremes of feeding.

COW RECORDS.—I speak particularly of the dairy breeds, whose life of usefulness should be not less than 10 years. The beefy steer does not need to feed longer than three years, and like the race horse, his energy is given over to short periods. We have an easy explanation of uterine and digestive weakness so common to animals that have been pampered. As an opposite one can go into sections where animals have, Topsy-like, "growed up" with plenty of run and pasture grass, coming on the stage of usefulness with a rugged constitution, from which, with a purebred sire of pronounced prepotency, have come animals with the milking habit and a constitution to back it up. A cow having only an ability to make a weekly record is about as worthless to a farmer who makes his bread and butter from her, as a two-minute raced would be to plow his fields. It is the ability to wear that counts in the scale of profit. The first cost of rearing an animal up to a two-year-old form, at which age they begin to pay their way, is no greater for one capable of milking 10 years than for one that, through lack of vital force, has one or more of the thousand troubles that end their profitable usefulness at half that age. Two men are subjected to similar conditions of living and labor. One of them catches cold, has indigestion, which means a bad temper; troubles are magnified or rather often manufactured. The other has apparently no trouble; by reason of a vigorous constitution he is able to vanquish trouble and foe without even recognizing the encounter. All other things being equal, which man has the greater chance to succeed? It seems to me therefore that the larger cows offer greater profit to a large class of milk producers who are not, year in and out, making butter or selling cream. This statement does not mean that the Channel Islands cows are not possessed of constitution, but the weakness of the young thing demands a more careful rearing, and when we find these cows being reared under these untoward conditions and environments we find a weakness developing, and a sweeping assertion that they are not hardy, this careless statement being disproved by breeders the country over.

HOME-BRED COWS.—I am unable to get statistics showing to what extent or rather what proportion of farmers buy their milking cows. I know New York, New Jersey and New England are using at least 25 per cent of their stock not reared by the farmers who milk them. Under the present system these cows are milked for a brief period and disposed of to the local butcher or dealer, at 75 per cent of first cost, if well fed and "slippery," a term usually applied to such beef. Another reason for the larger cow. But a very small per cent of the people who buy milk in our large cities is willing to pay for five or six-per-cent milk. They do not, on the other hand, want skim-milk, either skimmed by man or the cow. The average per cent of fat as determined by Dr. Van Slyke in his elaborate series of tests several years ago among cheese factories in this State was 3.8 per cent. I am inclined to think that this quality about fairly represents the milk of New York State aside from those sections like Delaware County, where the Channel Islands cows predominate. Milk of this quality is well balanced and satisfactory as a human food. The Holstein cow has an especial value, in her power to eat and assimilate large quantities of coarse bulky food. Bred for 2,000 years and fed mainly upon bulky food, she has splendid assimilation, and I do believe that the profitable cow of the future will be one that can consume larger quantities of roughage and turn it to a profit. Our eastern population is yearly becoming more and more suburban in its makeup. Local and near-by markets call for a variety of foods and products, many of them leaving a by-product nearly worthless as a market crop. The cow that can step into the breach and turn this roughage into money and at a profit without a heavy feeding of concentrates has a peculiar value.

THE MODEL DAIRY.—Has the careful work done at Buffalo established any breed possibilities? Doubtful! There may be one exception, however; the Red Polls have demonstrated their value, so far as these five animals are concerned, that they are profitable dairy cows and are as near a dual-purpose cow as one could find. So far as the older and established milking breeds are concerned it has proven nothing, in my mind, beyond a comparison of the individuals in the test. The work done has a value, and a permanent value, to dairymen. First and most important, in my judgment, is the education of attention to every detail of feeding and testing; knowing sure that results are profitable or otherwise, and a method for doing it. No one will expect such an array of method and labor on a 50-cow farm. It would take $1 a pound for butter instead of 25 cents to foot the bill. Every dairyman can, however, with small expense of labor and equipment, approximate these results and foot up at the close of each fiscal year either a profit or loss with some known causes. Everyone who has studied the weekly figures, or personally inspected the workings, should have some lesson drawn and applied to his own business. The lessons applied are the only ones of value. The one mentioned above seems to strike me where I am weak, and hence the strong impression left of value. The plans are already perfected for carrying out on our own farms, imperfectly of course, as compared to the Pan-American system, a more perfect system and method of accounting. H. E. COOK.

Can You

do a little pleasant and profitable work for us in your own town? No experience necessary. We will explain just what you have to do. The work will be light, and we will arrange for the time you shall be able to give to it. We can give you work for all your time or just for your spare time. Write for full particulars. THE RURAL NEW-YORKER, NEW YORK.

BEST FEED FOR STEERS.

Will you inform me as to the proper grain feed for two-year-old steers, when fed on Timothy and clover hay? I shall have to buy grain. F. E. L.

Rochester Junction, N. Y.

A mixture of three parts corn-and-cob meal, and one part each of ground oats, bran and oil meal makes a good grain ration for steers. If any change were to be recommended in this it would be to increase the proportion of cornmeal in the later stage of fattening. One can leave out some of the above grains, but good feeders will probably give good enough returns to justify the expenditure, and cattle usually grow faster and do better on a variety of grains than on only one sort. If you have access to hominy feed, and it is cheaper than cornmeal, it can probably be substituted for it with entire satisfaction. The bran is desirable on account of its laxative and cooling effect, while the oil meal helps produce a silky coat of hair and a mellow skin. If I were to leave out any of the above it would perhaps be the oats. If you have plenty of clover hay, feed it entirely instead of Timothy. Further, you will make money and practice good farming, if you sell Timothy and buy clover with the money, for while a ton of the former brings more money in the market than does a ton of the latter, as cattle food there is no better roughage for steers than good clover hay; besides, it contains a considerable amount of fertility which will go back to the soil. Timothy is not the best sort of hay for cattle, unless very fine and leafy and well cured. C. S. PLUMB.

If you find a cold creeping on, keep a bottle of Dr. D. Jayne's Expectorant near at hand, and take a little dose occasionally. It will relieve at once, and soon bring about a cure.—*Adv.*

A Lame Horse is neither valuable for use or sale. It is better not to have a lame horse.

A TALK ABOUT SHEEP.

I am keeping a flock of about 50 sheep of the ordinary mixed natives, which I find are too small and runty, and do not drop their lambs early enough. I want to have my lambs dropped in January or February at latest, as we have a brisk local market in May and June, and by July and August everyone has them for sale. Our Winters are mild; snow does not lie long, as we are surrounded by salt water, and we have more wet than snow. I wish to grade up with a purebred ram, but am undecided between a Hampshire or a Rambouillet, and at the Pan-American I saw some Cheviots which took my eye greatly, but I cannot find out much about them. I hear that they are hardy, good mothers, good milkers and prolific. Can they be depended on to drop lambs in January? Some say that only the Dorset or Tunis will do it, and they seem small in size, especially the latter. If this be true, which is better of the two latter breeds? The good points of all these breeds we can find out easily enough, but the weak points the papers seem afraid of mentioning for fear of treading on somebody's toes. Let me know the truth.

Suffolk Co., N. Y. J. R. T.

The inquirer desires his sheep to fill certain conditions. He wishes the ewes to lamb in January or February. That calls for breeding in September or October. He wishes early lambs. The Cheviot breed is notable for its hardiness, and the superior quality of its mutton, the salable type of wool and the beauty of the breed. The inquirer, however, states that the climate is mild where he is, and I do not believe Cheviots would be the best breed for his purpose so far south. The Cheviot is a superior breed in the respects above referred to. The ewes are also very excellent mothers, being good milkers and averaging more than one lamb per ewe. This breed, however, needs to be improved in the weight of fleece. Neither is it so fat in character as the Shropshire. These last two are the criticisms the breed might be considered most open to. It seems to me that for the securing of early lambs of the most salable class the Dorset is best suited to the purpose. This breed will lamb easily in January and February, and produce a high-class early lamb. It has already secured a foothold for this purpose in the best markets, and the lambs grow rapidly, and are easily fattened. I do not consider mature Dorsets as superior wool producers, but as early lamb raisers they rank high. The breed is also well adapted to mild climates.

The Tunis breed is much less known than the Dorset, but the few persons handling them make strong claims in their behalf. Mr. Roundtree, who has been prominently identified with the breed states that the ewes will breed any month in the year, and he makes strong claims in favor of the mutton, and the value of the Tunis in cross-breeding. The Dorset, however, crosses well for the purpose of meat production. The Hampshire ranks high, and many early Hampshire lambs have been sold in New York market, and the breed is an excellent one. Still, I think the Dorset may excel it in early breeding and possibly in fattening capacity. I have a flock of Rambouillets under my charge, and greatly admire the breed. The ewes will also breed early in the season. But this type of sheep in my judgment will not produce so high a class, and plump a lamb as will any of the preceding breeds, for early lambs.

C. S. PLUMB.

WHY WE BREED BERKSHIRE SWINE.

We are often asked whether we like the Berkshire better than the Poland China. They suit us better. The Poland Chinas in this, the southern central part of Ohio, outnumber all others combined. Chester Whites have a few representatives, and the Jersey Reds and their grades are found in limited numbers. In the early seventies we had on the farm grade spotted hogs that came nearer being Poland Chinas than anything else. Desiring something better we bought from Kentucky a pair of Berkshires whose sires and dams had but recently been imported. Other purchases followed, and soon crowded out the grade stock. From an imported sow that we bought there are descended, so far as we can tell, the brood sows now on the farm. Several years ago we crossed our Berkshire sows with a Poland China male, because our Berkshire boar was a failure, and besides we thought maybe the Poland Chinas would suit us better. But we did not experiment long in that direction, but got back to the straight Berkshires as quickly as possible.

We bought them first because we then thought them on many counts the best, and because we thought many of their traits and qualities suited us best. We liked their color and markings, and we have never seen any other color that suited us so well. These points are now the fashionable ones with the Poland China breeders. They stand well on their feet, and in growing up carry bone, muscle and flesh in the most desirable proportions. One great point in their favor with us is their free action. We want a hog that is a good grazer and gleaner; one that can clear up the wastes in the feed lot where the horses and cattle run, and go to its rest each night with sound bones and whole hide. For years we have kept our sows in the feed lot during Winter, where the horses and cows are kept during the day, and they have never been crippled or failed to bring their pigs all right at farrowing time. Always the objection against them has been that they are too small, yet a neighbor and a close observer and good feeder has expressed surprise that we were able to reach the same weights made by breeds claimed to be larger, and said that he did not know how we could do it. They respond to rapid feeding in the direction of early maturity to please us better than any other breed. We are satisfied that no other breed would glean our fields as well as they do, and save us the expense of harvesting. They are prolific, and the dams careful, and at the same time gentle and easily handled.

In two years we were able to market from five aged sows 161 fat hogs, excepting possibly a half-dozen that were reserved for breeders. We take great pleasure in having them so true to type that a stranger cannot note their individual differences. When ready for market they are always on their feet when they reach the station, and the shippers tell us that they are sure to be on top when they reach the market, and that they drift the least of any hogs they ship, and sell for the top price. We breed them pure because we can see no advantage in crossing them, selecting our brood sows from our own breeding, and purchasing males from some reputable breeder. We have not registered an animal of our own breeding for years. This does not add to their feeding quality, and is only a useless expense, as we grow to feed for market.

JOHN M. JAMISON.

Feeding Purchased Grain.

Would it pay in net profit to feed cows that came in in March to May, and are now giving a small quantity of milk on poor pasturage and cornstalks, a daily ration of grain, say equal parts bran and cornmeal? I would have to buy grain. Give feeding ration. B. V.

New York.

In former years, before adopting a system of sufficient food each day of the year, this question presented itself each Fall. Occasionally we tried it, but always failed to get a profitable return in milk. Finally I concluded that a break must be made some time for better feeding, and that no doubt whenever it was made it would at the outset be at a loss. It is just 22 years ago, and the change was begun by reason of abortion in the herd. Cows that were reduced to a small flow, as mentioned in the question, respond upon the back instead of the pail, unless they are exceptionally good ones. Had the questioner mentioned the value of the milk, it would have facilitated an answer. If the milk is sold at retail at usual prices, say five cents a quart, I should say yes. You will get enough extra milk to pay for the extra feed, and the improved condition of the animals will constitute profit enough. I would suggest a trial ration of one-third gluten feed, 27 per cent protein, or dried brewer's grains, and two-thirds bran or middlings, beginning with three or four pounds a day, and watching results. It is the watching out for results that answers more questions intelligently than anyone, however experienced, can do with pencil and paper. Do not feed cornmeal unless you have a cow very poor in flesh, which is a rare thing this Fall in northern New York, by virtue of such a splendid growth of grass. With these stripper cows the aim is to stimulate their somewhat dormant milking energies, and the protein foods will do this better than cornmeal, unless, as previously stated, cows are poor. Cornmeal for such cows for a while, say two weeks, will seem to start their systems into action with more profit than the blood-making foods. Another reason for discarding corn this Fall is the high cost. The cost of foods as well as the analyses must be considered in purchasing. H. E. C.

Soiling and Grain Feeding.

What soiling crops do you advise for Summer milk route (small)? Should a grain ration be fed with above and fair pasturage. C. M. V. B.

New York.

An answer to this question carried out to the letter will place the feeder in a position one year hence where he will find his cows giving a fair flow of milk, and ready to take on a grain ration at a profit. It is now too late to sow a Winter crop for early feeding (wheat or rye). But as early as the land will work sow one acre of oats and peas for each 10 cows. They will not eat it all, but the remainder will make good grain food, using 1½ bushel Canada field peas and 1½ to two bushels of oats. Be sure that the peas are in at least three inches deep. Repeat in 10 days, and again in 10 days or two weeks. This crop will be ready the end of June, and last until early corn is ready, and then with plenty of corn, and silage as soon as cut and filled, making Winter milk from good cows in warm stables is an easy and sure result. H. E. C.

A Post Office At Your Door.

That is just what it means to have one of these mail boxes put up in front of your home. It will hold all incoming or outgoing mail securely and without danger of damage from wind or weather.

Uncle Sam's Favorite Mail Box

is not like others—it is better. Made of heavy steel plates, securely riveted together—no solder. Only one seam in entire box. Note the letter and change holder. Spring lid; always stays closed. Cannot be blown open. Box finished in aluminum—can't tarnish or rust. Will last indefinitely. Sample box with your name on, sent express paid, for $2.00. Larger quantities at lower rates. Every New Subscriber who will mention this publication or cut out this slip and send it at once with $1.75 will receive:
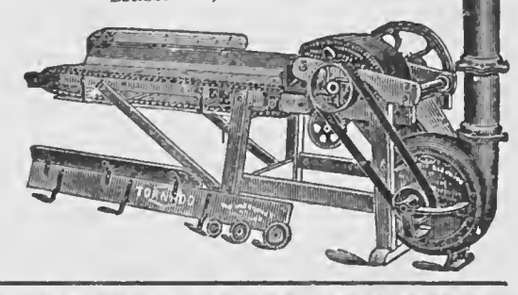
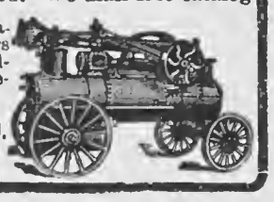
FREE—All the issues for the remaining weeks of 1901.
FREE—Thanksgiving and Christmas Numbers.
FREE—The Companion Calendar for 1902, lithographed in 12 colors and gold.
The Companion for 52 weeks of 1902,—250 stories, 50 special articles, etc., etc.
From now until Jan., 1903, for $1.75. AA172

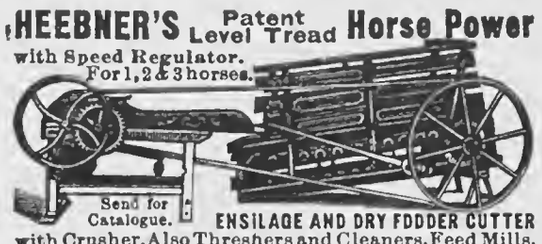
THE YOUTH'S COMPANION, BOSTON, MASS.

TORNADO FEED CUTTING Machinery
Up-to-Date in every Detail.
LARGEST LINE
Blowers or Chain Carriers.
FREE SAMPLE of machine's work and Catalogue upon application.
W. R. HARRISON & CO., Mfrs., Massillon, Ohio.
Patent Pending

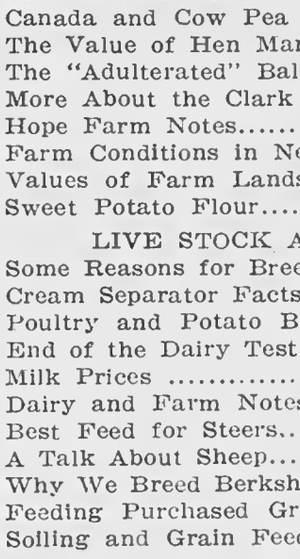


NO BETTER
Outfit was ever made for clean, fast work than this
FARQUHAR
Variable Friction Feed
SAW MILL AND AJAX CENTER CRANK ENGINE.
Unexcelled for strength, simplicity, easy handling, large capacity, etc. Engine mounted on wheels or sills. Perfectly safe, as—no Farquhar boiler has ever exploded. We mail free catalog of Portable Engines, Saw Mills, Threshing Machines, Engines, Boilers and general line of Standard Agricultural Implements. Write for it.


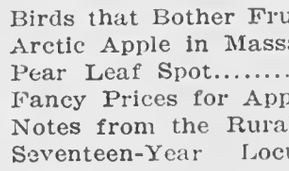
A. B. FARQUHAR CO., LTD.
YORK, PA.

HEEBNER'S Patent Level Tread Horse Power
with Speed Regulator.
For 1, 2 & 3 horses.


Send for Catalogue.
ENSILAGE AND DRY FODDER CUTTER with Crusher. Also Threshers and Cleaners, Feed Mills, Corn Shellers, Drag and Circular Saw Machines, etc.
HEEBNER & SONS, Lansdale, Pa., U. S. A.



STEVENS
Anti-friction, Bridge tree, Automatic adjusting, Self-sharpening, Covered gears, Light draft, Non-choking Hand, Sweep, and Power farm mills, for all purposes. Will grind all grain to any degree of fineness. Thousands in daily use everywhere. Send for free catalogue C. Agents wanted.
STEVENS MFG. CO., Fisher Bldg., Chicago, Ill.

BRAND NEW STEEL ROOFING


Bought at Receivers' Sale. Sheets either flat, corrugated or "V" crimped. No tools except a hatchet or hammer is needed to lay the roofing. We furnish free with each order enough paint to cover and nails to lay. Price per square, $1.75
A square means 100 square ft. Write for Free Catalogue No. 57 on General Merchandise.
Chicago House Wrecking Co., West 35th and Iron Sts., Chicago, Ill.

HIGHEST AWARD
AT THE PAN-AMERICAN EXPOSITION
The United States Cream Separator
HAS WON
GOLD MEDAL OR THE HIGHEST AWARD
at **Every International Exposition** at which it has been exhibited since its invention.

Our "would-be competitors" are advertising extensively as follows:
"The supremacy of the DeLaval machines at Buffalo is a continuation of their triumphant record at all previous great expositions."
Yes, this supremacy (?) is a continuation of their triumphant (?) record, and that record shows the "triumphant supremacy" was

IN WIND BUT NOT IN WORK

Mr. Edward Van Alstyne, Supt. of Model Dairy at the Pan-American, states, under date of Nov. 1st, "I find since the receipt of your letter, after carefully going over the figures of the seventy-one runs of their (the DeLaval) machine that I miscalled the figures, and the reading should be .0172 instead of .0161."

NOW READ WHAT THE UNITED STATES SEPARATOR DID IN THE MODEL DAIRY

Mr. Van Alstyne states in reference to the work done by the United States Separator in the Model Dairy at the Pan-American Exposition, from Sept. 29th to Oct. 30th, inclusive, that in the fifty separate runs made by that separator during these days, with the milk of the ten different herds in the dairy test, the average per cent. of fat left in the skimmilk was .0138.

DeLaval average test of skimmilk -	.0172
United States average test of skimmilk	.0138
Difference in favor of the United States	.0034

This shows that the DeLaval separator left 25 per cent. more butter fat in the skimmilk than the United States—an immense waste that amounts to a very large sum of money upon the dairy products of the world. Enough to pay for a United States Separator to replace every DeLaval Separator now in use.

Perhaps our chagrined and "disgruntled would-be competitors" "with characteristic advertising honesty" will undertake to bluff this statement off, but it remains true and is a matter of record that cannot be successfully denied.

On the practical every-day work

GUIDE BOARDS FROM THE MODEL DAIRY.

WHAT THE BUFFALO DAIRY TEST SHOWS.

Edward Van Alstyne's Comments.

NOT PHENOMENAL COWS.—After the six months' battle of the breeds is ended and the cows have "come home" strong and well, and in increased flesh, it would seem as if it were wise to call attention to some of the many points brought out and lessons taught. These were not phenomenal cows and beyond the reach of the well-to-do farmer, but fair samples of the different breeds represented. Nor was their production so large in either milk or butter as to be beyond ordinary attainment. This is evidenced when the Guernsey cow, Mary Marshall (the banner cow), in her best week (that ending May 21) gave 16.22 pounds of estimated butter, and the second-best cow, the Red Poll Mayflower, in her best week (that ending May 28) gave 15.07 pounds. The average per day for the six months of the Guernsey herd in churned butter was 7.77 pounds or 1.55 pound per cow; of the Jersey herd 7.65 pounds per week or 1.53 pound per cow. The total production of milk by the Holstein and Ayrshire herds was 39,269.94 pounds and 32,969 pounds respectively, or an average per day of each cow of 42.68 pounds in the former and 35.83 pounds in the latter. There are many working dairies that can show records equally as good, and better. It would be interesting if readers having such would report. Many times the remark has been made to the writer that these cows were given extra care, which would be impracticable in a working dairy. This point I have studied very carefully, and the consensus of opinions of those in charge, including the herdsmen, was that the extra care would hardly balance the unnatural conditions; i. e., excitement from crowds, close confinement, little or no exercise and unduly long hours, they being milked and fed at 5 A. M., 12.30 P. M. and 8 P. M., never getting entirely quiet until 9 P. M., and this was detrimental.

SACKED WHEAT IN THE PALOUSE COUNTRY DURING THE WHEAT BLOCKADE OF 1897. FIG. 354.

EXERCISE FOR COWS.—This naturally brings up this point: Do cows need exercise, or is entire stable feeding during the Summer desirable? I have very decided opinions on this subject, yet to prove conclusively the first point from this test would be impossible. I can only point to some suggestive circumstances. Without doubt they gave as much or more milk from not wasting energy in search of food, and perhaps took on more flesh. That this practice is to be commended for a breeding herd, that is to go on for generations producing healthy and strong offspring, I believe no careful student of maternity will allow. It was a source of perplexity to those of us, who handled the product, why a higher flavor could not be produced in our butter. It seldom scored over 42 points for flavor, and often in some of the churnings the flavor would be positively bad. This, too, with milk strictly clean, handled in the most approved manner, and with the best culture for starter. After careful investigation along all lines we tested the milk of each cow in a jar by itself, and found that in many of the cows the milk developed an odor plainly brought about by indigestion. Some of this doubtless was due to our feed (as 60 pounds of silage with six pounds of hay and 10 or 12 pounds of grain is more than the ordinary 1,000-pound cow can digest, particularly without exercise). After the yard was built near the barn for judging sheep the Jersey cattle for some time were allowed to run in it for an hour or two at night. That week their butter scored the highest in the barn, and the highest it had scored for the season.

SILAGE AND SOILING.—As to the practicability of silage for Summer feed there can be no doubt. Our silage until August 13 was brought from Hamburg, 17 miles distant, in spite of which, when drawn by our own men, it was in excellent condition. From that date until September 17 we fed in place of it oats and peas, millet and green corn; when we fed from the silo built on the grounds. After going over carefully the cost and amount of feed for the different herds during these periods the tendency seems to be that with the green feed *a little* less grain was fed. Yet the average cost of the ration was no less, and the milk production no more from the green feed than the silage. The difference in the amount of grain is accounted for by the grain in the silage. It seems very clear that cattle will produce more milk from the feed they graze in the pasture than from that cut and fed to them. Every dairyman knows that with *abundant* pasture little or no grain is needed. Yet to keep up a profitable milk flow these cows were fed from eight to twelve pounds of grain each a day, practically Winter rations. I would therefore conclude that when land is cheap and not easily tilled pasture is much cheaper than soiling; that land producing abundance of other crops would better be cropped than pastured, but that ordinarily the two systems can best be combined with profitable results.

NO ONE "BEST BREED."—We have certainly demonstrated that no one breed contains all the best cows. A man must be guided by his surroundings, amount of feed produced on his farm, and what he purposes to do with his product. I have no hesitancy in saying that the man who wishes to produce butter should select one of the Channel Islands breeds, not only because they can make a pound of butter at less cost, but because their butter is of a finer texture and higher color. The Guernseys made a pound of butter fat for 10.9 cents for the cost of food, the Jerseys for 11.1 cents, the Ayrshire 11.5 cents, and the Holstein 12.9 cents. The butter from any of the Channel Islands breeds, particularly the Polled Jerseys, could be churned at a much higher temperature and under unfavorable conditions and still be firm and merchantable than could that of any other breeds in the barn. For milk production where the fat is not the main factor and feed is abundant the Holstein or Ayrshire would seem to be the desirable cow. The former made a pound of solids at a cost for food of .0347 per pound, a pound of milk for .00419; the latter a pound of solids for .0336, a pound of milk for .00427. The Guernsey's solids cost .0362 cents, milk .00504 per pound; the Jersey's solids .0365, milk .0059 per pound for cost of food. The former with an average per cent of solids of 13.9, fat 4.6; the latter 13.6 solids, 4.58 per cent fat. The lower cost of solids in the Ayrshire milk is due to the fact that the average per cent of total solids in this milk was 12.6 per cent, the average fat 3.69 per cent, while that of the Holstein was 12 per cent, the average fat 3.25 per cent, a very significant factor in cheese making. It is interesting to note that the French Canadian cattle made a pound of solids for .0344 and a pound of milk for .00466; their average per cent of solids being 13.3 per cent, with an average fat per cent of 3.99. This point will be of value to many who have small farms and a limited amount of feed available for the dairy.

Doubtless no breed attracted more attention than the Red Rolls. They produced a pound of solids for

.0365, a pound of milk for .00488 cent, and a pound of butter fat for .1209 for cost of food consumed, with an average fat test of 3.98 per cent and 13.1 per cent solids, at the same time gaining 349 pounds in weight, coming certainly very close to a "general-purpose" animal. In localities where it is desirable to grow beef, a good calf or steer, and at the same time produce milk and butter at a moderate cost, this will be, I believe, the coming cow. Much has been said about the gain in weight by Short-horns, 802 pounds, or an average of 160.4 pounds per cow. This was worth at three cents a pound $24.06. They are within $2.57 as much feed as the Holsteins and produced $59.04 less value of solids, $40.29 less value of butter fat. Their food cost $24.09 more than the Red Polls, for which they made $28.15 more value in solids and $18.87 less value in butter fat. As compared with the Ayrshires their feed cost $21.14 more, their solids were worth $8.89 less, and their butter fat $23.70 less. The Holsteins gained 391 pounds, the Red Polls 349, and the Ayrshires 218 pounds. It ought to be evident in spite of the fine record made by this most valuable breed that it is vain to deny that dairying is not most profitable with a beef cow. The foregoing are some of the points that were brought out in the late breed test. There are many more that might be interesting, but these well digested will, I believe be a large enough dose for one sitting.

EDWARD VAN ALSTYNE.

COST OF WESTERN CORN PRODUCTION.

The cost of producing a bushel of corn depends upon the yield per acre. This yield per acre in turn depends upon the fertility of the soil, the season, the character of seed, and other considerations. Consequently, most of the investigations for any individual year or locality show very widely different results. However, in considering the cost of raising an acre of corn, the results of the different men engaged in studying this problem generally agree. There are three particular instances where authentic records have been kept of the cost of producing corn in Illinois, and the Central West. First, the manager of the Sibley estate of about 20,000 acres, F. A. Warner, has kept a record of cost of the various operations in producing corn for his own use in handling their great crop. In this case the corn is produced on farms averaging 160 acres for each tenant, of which about 80 acres are kept in corn every year. The following table shows the cost of raising 80 acres of corn and delivering two-fifths rent in Sibley, at the estate's elevators, and tenant's share in his cribs at the farm. The wages of man, team and tools are given as $3 per day, the average wage rate in that vicinity, except husking, which is estimated at $2.50 per day. Additional horses are charged for at the rate of 50 cents per day, and one man $1.50 per day.

Operation.	Rate.	Cost.
Fall plowing, 60 acres	$1.00 per acre	$60.00
Breaking stalks, 20 acres	3.00 per team & man	6.00
Spring plowing, 1 team 7 days	3.50 per day	24.60
Disking Fall plowing	4.00 per day	16.00
Harrowing, 2 days	3.50 per day	7.00
Seed corn, 13 bushels	.50 per bushel	6.50
Planting, 5 days	3.00 per day	15.00
Harrowing after planting	3.50 per day	8.75
Cultivating, 2 teams 19 days	3.00 per day	114.00
Pulling weeds, 4 days	1.50 per day	6.00
Cutting turn rows, 4 days	1.50 per day	6.00
Husking corn, 2 teams 26 days	2.50 per day	130.00
Hauling rent	2.50 per day	30.00
Extra work, replanting, etc		10.00
Total		$439.85

The average yield per acre is about 40 bushels per acre, so that the cost per bushel on this basis would be 13.75 cents. This does not include the rent. If we take the Sibley rent system of two-fifths share for landlord as a basis, the cost of raising a crop for the tenant would be found by deducting two-fifths of 40 bushels from 40 and dividing the cost per acre by this figure. The total cost for 80 acres is $439.75. Therefore, for one acre the cost would be about $5.50 per acre. Dividing this cost by 24 the tenant's share of crop, the cost per bushel for the tenant is seen to be 22.9 cents per bushel. At the ordinary rate of rental in central Illinois of one-half the crop, the cost would be 27.5 cents per bushel. The second record of the cost was made by the agricultural statistician B. W. Snow. The following table shows Mr. Snow's record of cost of producing corn in 4,051 acres.

Operation.	Average Cost Per Acre.
Cutting stalks and breaking stalks	$.054
Plowing	.425
Harrowing	.144
Listing	.027
Fertilization	.809
Planting and replanting	.155
Seed	.082
Cultivation	.679
Harvesting	1.372
Taxation	.283
Team maintenance	1.450
Depreciative machinery	.209
Depreciative horses	.149
Total annual investment	$5.838 per acre
Less value of fodder	.781 per acre
	$5.057 per acre

Cost per bushel at rate of average yield 39.2 bushel per acre, 12.9 cents. This data does not take into account rent or interest on land. Mr. Snow presents a further table, taking up all items, including interest on the investment and on the land, as follows:

Annual investment or cost per acre	$5.057
Interest on machinery	.125
Interest on horses	.089
Interest on animal investment	.303
Interest on land	2.862
Total	$8.436
Total per bushel	21.5 cents

From these tables it can be seen that the records of Mr. Warner and Mr. Snow closely agree, taking into account different conditions. The third investigation was conducted by the Department of Economics of the University of Illinois, in charge of N. A. Weston. By averaging the records of several hundred farms for the year 1896, Mr. Weston found that the average cost per acre was $8.72, including rent of land. A tabulated cost in one instance was as follows:

Cutting stalks	$.19 per acre
Plowing	.90 per acre
Harrowing (smoothing)	.17 per acre
Planting	.28 per acre
Harrowing	.26 per acre
Cultivating (3 times)	1.13 per acre
Rent	3.25 per acre
Interest on equipment	.22 per acre
Wear and tear	.42 per acre
Seed	.12 per acre
Harvest	1.80 per acre
Total	8.74 per acre

Yield, 46 bushels per acre. The cost per bushel was 19 cents. It would seem, therefore, that the cost of growing a crop of corn, including the rent or interest on investment and interest on the equipment would amount to about $8.75 per acre. The cost per bushel rests largely with the farmer. If a good farmer, the cost will be low and the profits high; therefore, if a poor farmer, the profits will be low and the cost per bushel high.

A. D. SHAMEL.

HOME OF THE CALIFORNIA APPLE.

Redskins Are Not Wanted!

I recently took a trip up through the Pajaro Valley among the apple growers. Leaving the train at Chittenden, the end of the road leading from the valley up into the hills, I followed the grade for a couple of miles, when a widening of the cañon revealed a hundred-acre apple orchard, where I spent some time asking questions. About three miles farther down the grade brought me out into the valley proper, and from this point on to Watsonville there was little land that was not set out to apple orchards in all stages of growth, from one-year-olds up to 30 years or more. Fine crops of beets, squashes and corn were being harvested from the younger orchards. Watsonville was at one time the center of the sugar-beet industry of this coast and the factory, shown at Fig. 356, where the donkey engines are unloading beets, was the original plant. No sugar is manufactured there now, but a larger plant is in operation at Salinas, about 20 miles south, to which place all of the thousands of tons of Watsonville beets are hauled on a narrow-gauge road owned by the Spreckles Company. Fig. 357 shows a four-horse load of beets on the way from the ranch to the yard at Watsonville. These wagons hold about five tons, and are loaded in a net, which covers the bottom and sides of the bed. When arrived at the yard and drawn up by the side of a car the donkey engine grabs hold of the net and yanks the whole load on to the car while one can count three. As soon as a train is loaded it is pulled out to make room for more empty cars. The growers are paid this season $4.50 per ton average for beets according to sugar test.

Near the depot at Watsonville are located numerous packing houses where the great crop of Pajaro Valley apples is packed for shipment. The apples are packed in boxes, every apple is wrapped in paper, and supposed to be free from worms and otherwise sound. If the stem is gone or a blemish of any kind appears on the apple it is rejected. Fig. 358 shows a load of apples and Fig. 359 a Watsonville orchard. These apples are almost all sold f. o. b. Watsonville, the buyer shipping where he pleases. The Newtown Pippins and Bellflowers are largely purchased by agents from fruit dealers in London, and these two varieties comprise, I should say from observation, more than three-quarters of the entire crop. Prices this year are $1 per box for Bellflowers, and $1.25 for Newtowns. Pearmains, Red and White, and Smith Cider make up the greater portion of the last quarter of the crop, while Missouri Pippins, Langford's Seedling, Winesap, etc., are occasionally seen. A box of apples weighs from 40 to 44 pounds, varying according to variety and size. The supposed demand for red apples seems not to affect the plantings in the Pajaro Valley. In fact, the apple growers seem to make room only grudgingly for any variety other than Newtown or Bellflower, and the result is that there are few orchards where a succession of apples is planted for home use, and at the hotel I found only the two popular varieties, and they were too hard to be eatable. At a restaurant I called for baked apples or apple sauce, and was met with a look of surprise, which said by inference that apples are too common an article to make an appearance on their bill of fare.

The Codling moth has been increasing rapidly in this section the last year or two, so much so that some of the growers are becoming alarmed. A 40-acre orchard of seven-year-old trees produced last season 10,500 boxes of sound fruit and about 35 boxes of wormy apples. This season fully 50 per cent of the apples are wormy. Some growers have sprayed and banded their trees with good results, while others have done nothing, and have allowed their orchards to become breeding places for the moths. The San José scale has also appeared in some orchards, and some spraying has been done. One orchard that I visited seemed particularly clean. In conversation with the owner I found that only last year there was some scale there, and that it was alive with Woolly aphis. This was evident from a closer examination of the wood. A few trees had been sprayed, but the main orchard had been cleared of aphis by the ladybugs and a lace-wing fly that earlier in the season was plentiful there. The ladybugs were not the "twice-stabbed" variety that we have here, but were gathered in the brush near Lassajara Springs in the mountains. Mr. Rogers, the bug inspector for that district, told me that the "twice-stabbed" variety did not seem to thrive in their cool foggy climate, and that he was an advocate of spraying, his favorite wash being the lime, sulphur and salt mixture which was quite extensively used in the Santa Clara Valley at one time, but is now almost entirely discarded. The invasion of the Pajaro Valley by the Codling moth is a serious matter, as it means a reduction in price from say $50 per ton for sound apples to $4.50 per ton for wormy ones delivered to the driers.

H. G. KEESLING.

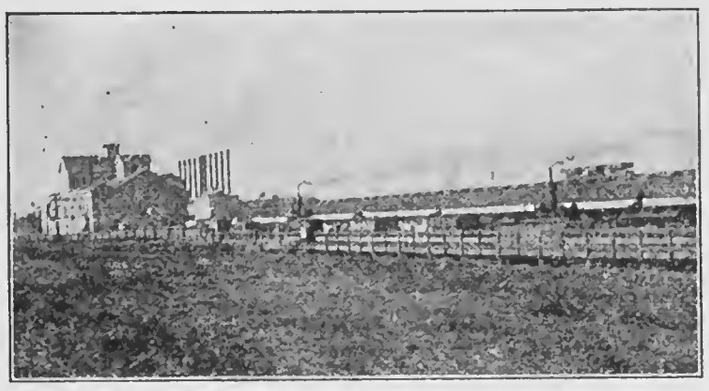
SUCCESS WITH "CHEMICALS AND CLOVER."

Speaking of "chemicals and clover," and the question just asked by a subscriber, on page 706, whether it will go, induces me to say that in 10 years I have taken good crops yearly, and some years two, from a heavy clay loam that was producing three-fourths of a ton of poor hay when we began. This season it produced a little over two tons per acre of good market hay, and the only fertilizer we have used has been 200 pounds of any good general grain fertilizer and clover rowen plowed under. On parts where we have been able to put a little stable manure in addition to above we have cut over three tons per acre. I write this for the benefit of your subscriber or any others in like situation. I know that the problem was a stiff one for me when I started in.

Vermont. C. A. CHAPMAN.

JERSEY SWEET POTATOES FOR AUSTRALIA.—We shipped to-day to the Department of Agriculture, Sydney, New South Wales, Australia, two barrels of sweet potatoes for seed, consisting of 28 pounds Big Stem Jersey Yellow, 28 pounds Little Stem Jersey Yellow, 56 pounds Jersey Red, 56 pounds Vineland Bush, 56 pounds Pierson, 56 pounds White Maryland. This shipment goes direct from New York to Sydney by steamer. Each potato was wrapped in paper. This is a long way to ship sweet potatoes, as they are quite subject to rot. It is hoped, however, that at least a part of them will arrive in a sound condition. They will be bedded immediately on their arrival if sound, as the Summer there will be well advanced by that time. They will be about 80 days on the water, and travel about 14,000 miles.

Vineland, N. J. F. S. N.



UNLOADING BEETS AT RAILROAD. FIG. 356.

JERSEY POTATOES.

Big Crops and Good Prices.

YIELD IN AN OFF YEAR.—Monmouth County, N. J., may usually be depended on to produce a fine crop of potatoes, the sale of which often brings in considerable revenue. Even in this year of general potato failure some large and profitable yields have been made within her borders. The crop immediately about the old town of Freehold is noticeably good, and accounts of profits sufficient to pay off mortgages and buy new farms have been freely circulated. An investigation by THE R. N.-Y. shows that the reports are well within the facts, and that really big yields, considering the trying nature of the season, were quite common about Freehold, as well as in restricted localities in the adjoining County of Middlesex. Wm. M. Moreau marketed 1,900 barrels from 19 acres; D. H. Buck got 2,000 barrels from 22 acres; Ben. Hayes 1,781 barrels from 14 acres, and W. T. Clayton 2,072 barrels from 20 acres. The barrels, of course, are computed at 180 pounds, or three bushels each. The prices received for delivery to buyers in bulk at the freight station were about $2.75 for those first out of the fields, and $1.60 for the main crop later, the average being close to $2 per barrel. Even the small sizes brought over $1.25 a barrel. It is thus evident that some of these crops brought in more than $4,000 cash to the growers. Larger yields and greater profits are spoken of, but the above may be taken as entirely reliable. These yields, without exception, were made on well-equipped farms by experienced potato growers, who rely on this useful vegetable as a money crop. Only twice within the last 15 years has there been an equal or better yield, and in neither case was the price, based on failures elsewhere, as favorable, so that a repetition of this season's financial success is not to be expected soon.

SOIL AND CULTURE.—There is quite a remarkable uniformity in the soils and methods of cultivation, the former being clay loams of good consistency, with rather retentive clay subsoils. A four or five-year rotation is carried out, which is sometimes curtailed by the use of Crimson clover. The ordinary method is to use all available stable manures on a suitable field of sod, and grow a crop of corn, giving especially careful cultivation to keep down weeds. Crimson clover is often sown at last cultivation, but the practice is not gaining, as the clover at times makes but an indifferent growth in the dense shade of tall corn. As early the next Spring as the ground can be worked it is deeply plowed, the usual practice being to shave up the subsoil. This brings up the decomposed sod and manure turned down the preceding year, and mixes it well through the whole furrow. A Cutaway or Acme harrow quickly follows and levels the furrows, which are further fined with drag harrows until brought to the necessary tilth. These potato farmers are great believers in thorough preparation, and act on the conviction that no subsequent cultivation can make up for slovenly harrowing. The potatoes are now planted with one of the standard horse planters, set to drop about 14 inches apart in the rows. Wider intervals are not approved, as in the case of missing plants there is an unprofitable interval, while the 14-inch space is usually filled by the extra development of the nearest plants. The rows are spaced about 34 inches apart, as repeated trials show this distance favorable to a maximum crop on a given area of land. The planters are set to cover as deeply as possible, and work very well on these well-prepared fields, there being practically no stones, and the surface generally very level. The effort is made to get the seed pieces in deep enough to average two inches under the soil when field is leveled with harrow after planting. This means covering at least four inches under the ridges left by planter, which is about the limit of effective work as the machines are now made.

FERTILIZERS AND TILLAGE.—The question of fertilizing with chemicals is of great importance, and seems well worked out locally. From 800 to 1,200 pounds of some reliable "potato manure," analyzing about 4½ per cent of nitrogen, 9 of phosphoric acid and 10 of potash, is used, put in with the planter. Most of the standard brands of commercial fertilizers have been used with good results, but the chief dependence of the farmers mentioned now seems to be on a local mixture prepared by J. H. Denise, of Freehold, himself a practical and successful farmer, as a result of experiments carried on for 20 years for the purpose of finding the combination best adapted to the retentive soils and average climate of the vicinity. He disposed of 1,000 tons last Spring within a 12-mile radius, nearly all being used for potatoes, with the results above reported. Thorough preparation and good fertilization are most important factors, but these Jersey potato men well know the absolute necessity of constant tillage, and keep their cultivators and weeders going throughout the growing season until the vines meet across the rows, and even then break up the centers with narrow shovel plows if there is any sign of crusting. There is but little variation in the method except in the use of riding and walking cultivators, the tendency being to go back to the single-horse walking type, so commonly used by truckers. The fields are harrowed immediately after planting to

A LOAD OF CALIFORNIA SUGAR BEETS. FIG. 357.

level the ridges, though some practice deep cultivation first, followed by a weeder across the ridges, which answers very well. The object is to get the ground in thoroughly good condition and the weeds pretty well killed off before the plants are more than three inches high. They try to cultivate twice a week, or at least after every rain, as long as possible. The weeder is run after nearly every cultivation, taking out a tooth immediately over the rows as the tops gain in height. Much stress is put upon cultivating as near the plants as possible, and the fining and filling in of fresh soil about the stalks by the weeder teeth. Where this implement is intelligently used there is scarcely any need of the hand hoe. The Potato beetle is disposed of with Paris-green, applied at the rate of 1½ to 2 pounds to the acre, preferably with a dry powder gun, whenever a new brood appears. These guns are often operated

A LOAD OF CALIFORNIA APPLES. FIG. 358.

from the tail of a light wagon driven between the rows, thus enabling the operator to work away from the dust. Two men and a quick-stepping horse will cover 12 to 15 acres a day in this manner. The potatoes are dug as soon as mature, or even before if the price warrants, with one of the later power diggers and hauled to the shipping station in bulk, where they are awaited by buyers who ship to various Pennsylvania points, chiefly in the mining districts.

VARIETIES SELECTED.—This brings us to the question of varieties, the least creditable feature of these agricultural operations. The American or Summer Giant is planted almost to the exclusion of better-quality kinds. It suits the soil, grows and yields well, and it is not subject to scab, or grub, as the affection is locally known. The growers don't eat them—they are too soapy to be liked when better varieties can be had, but they are acceptable to the mining trade. The seed potatoes come from the northern counties of New York, Onondaga, Oswego and Ontario, as the product of this section is found to succeed better about Freehold than that from points farther south. Repeated trials have convinced the growers that home-grown seed, no matter how high the apparent quality may be, gives less satisfactory results than northern, and they say that they cannot afford to plant potatoes of their own growing in quantity. For home use an acre or so of Rural Blush, State of Maine, or Bovee is grown, but under exactly the same conditions a yield 25 per cent less is expected than from the Giant. Wheat or rye is usually put in after the potatoes, the unappropriated plant food left by the Spring fertilization being sufficient to insure a good crop, and the land seeded to Timothy and Red clover in the usual manner. A year or two in meadow and pasture completes the rotation mentioned in the early portion of this account, but a frequent practice is to sow Crimson clover thickly as soon as the potatoes are out, and turn down the growth next Spring for another crop. How long this may be safely carried out has not been demonstrated, but one of the best crops of the season was made by Ben. Hayes, of East Freehold, in this manner, though he coated his clover field with stable manure before plowing it down, and used 1,000 pounds of chemicals in addition. His crop of 1,781 barrels on 14 acres, however, scarcely represents the full yield, as he dug half his field before maturity on account of attractive prices, which netted him more than the greatly increased turn-out of the portion left to gain full size.

An important feature of these operations is the intelligence and energy of the growers. All the farmers visited were found personally directing the farm work, and planning still better yields if Nature will allow it. They make a careful study of the local needs of their crops, and spare no reasonable expense and labor to insure favorable conditions. They say that they can grow potatoes in average seasons for 30 to 40 cents a bushel, and are much encouraged at the result of this year's work. They expect potato planting to be overdone next Spring, but purpose to keep right on in their investigations.

W. V. F.

SOWING CLOVER IN THE CORN.

Believing in clover gathering nitrogen last year I sowed it in corn at the time advised by many, viz., early in August. It caught well, and lived through the Winter, and was plowed again this year for corn. The disadvantage I find with this late sowing is that corn is large and apt to be broken by the horse and singletree of cultivator. The corn being large makes it hard to sow seed well, unless one does it from horse's back, in which case considerable seed is lost on cornstalks and leaves. This year I sowed it about July 5, just before a rain. The corn was not high enough to interfere with sowing or cultivating, and it is now but little larger than clover sown a month later last year. It has not made any stalk so (as I understand if it does it will not live through the Winter) I claim I have made a gain. If it draws nitrogen from the air the longer it has to grow this year the more nitrogen it draws, as in plowing again for corn next Spring it will have but little opportunity to grow then. Another point; if fodder and corn are taken off by November 1 there is a nice lot of pasture for cows for a couple of weeks, certainly more than enough to pay for seed and labor, and a clover sod to plow down.

Westchester, Pa. G. B. L.

R. N.-Y.—Do we understand that you used Crimson clover? In our experience this has proved better for Fall seeding than the common Red. It makes more and quicker growth through the Fall and Winter. We have tried several experiments in mixing the Crimson clover seed with rye, rape and Cow-horn turnips. While we have not gone far enough in this to be sure, we conclude that the mixture of clover and turnips in the corn is as good a "cover" crop as we can get. By "cover" crop we mean one to be plowed under in early Spring.

GRAPE PROSPECTS.—The vineyardists on this belt are not pulling out their grapes. On the contrary, they are buying more vines to put out more acreage, although we have 30,000 acres on our belt. The exact reason, I think, that they are not pulling out vineyards, and are going to plant more, is that the grapes here are bringing big prices, better prices than they have before in many years. GEO. S. JOSSELYN.

FARMERS' CLUB

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Cleaning Cockle Seed from Wheat.

Reader.—A recent article in an agricultural paper says that cockle can be taken out of wheat by soaking all in a weak brine—the cockle rising to the top. Will not this soaking in brine injure the wheat for seed?

ANS.—Regarding soaking grain in a strong solution of brine, I would say that the practicability of it would appear to depend largely on the conveniences at hand for treating the seed and drying it after soaking. I do not believe that a solution of brine will injure the germination, although I cannot speak positively on that subject. Strong solutions of salt are not as readily absorbed by seeds as pure water, and the phenomenon has been observed that while a weak solution of a poisonous salt will injure germination, a very strong solution of the same salt can be used without injury. We shall take opportunity before long to make a test of the effect of brine upon the germination of grain seeds. A. J. PIETERS.

Poultry Manure for Strawberries.

H. G. B., Zionsville, Pa.—I have a strawberry patch that was planted last Spring, and bore a good crop this Summer. What do you think about giving it a good dressing of poultry manure this Fall, followed by a mulch of strong horse manure? Most of the old plants were plowed up, leaving only a narrow strip of row from which new plants spread out.

ANS.—We should call this a case of "better late than never." The poultry manure will help the strawberry plants, but it should have been put on in August or earlier for best results. That is the time to fertilize the strawberry for fruit, as the fruit buds are formed during the Fall. The manure will still prove useful, but would have been better two months ago.

Clipping Alsike Clover.

R. H. S., Homer, Ont.—In the issue of October 12 of THE R. N.-Y., on page 697, W. T. C., Albion, Ind., writes of clipping clover for a crop of seed. Of course he refers to Red clover: Could any readers of THE R. N.-Y. tell me whether Alsike could be treated the same way? If so, at what stage of growth should the clipping be done?

ANS.—In the original article the "clipping" referred to may mean ordinary cutting of the clover for seed and not merely the clipping of the heads. We know of no way by which the clover heads could be cut for seed leaving the straw standing. Alsike clover to be cut for seed should be allowed to approach maturity before cutting. It should become as mature and dry as possible without getting so dry that the seed will shell out. If the writer of the original article referred to can give information about clipping Alsike it might clear up this point.

L. A. CLINTON.

Grapes and Shade Trees for Massachusetts.

E. A. G., Norfolk, Mass.—1. What varieties of red, black and white grapes would you recommend for this frosty section? I have a Worden vine and also suppose I have one of Diamond, but it has not yet borne. 2. What varieties of forest trees would you use for shade purposes besides maple and chestnut; elms are not wanted. Trees for size, beauty and durability are desired, as well as different kinds. Does the Catalpa grow to a large size?

ANS.—1. Campbell is one of the newer but most excellent early black grapes. Winchell (also called Green Mountain) is a good white variety that ripens early, and Niagara is of the same color, but later and on the whole a better grape. Brighton is a red variety of the highest excellence. All of these are reasonably hardy. 2. The tulip makes a very good shade tree, and is well suited to street or yard planting. It makes a large and shapely tree, has beautiful foliage and bears flowers that resemble tulips. The hardy or western species of Catalpa grows to large size and has large clusters of handsome flowers, but the branches are coarse and straggling, and although the leaves are large the shade is not dense. The Japanese walnuts make thrifty and beautiful shade trees. The nuts are not very valuable from an edible standpoint, but they are borne in abundance and the flavor is good. H. E. V. D.

A Strange Apple Pest.

W. B. F., Lawrence, Ind.—I send an apple that has been marked by some species of insect. I am at a loss to know what did it. I find many apples so marked on certain trees, and some on all. Is it the work of the Palmer worm? I do not think that it is the Codling worm. I have each year given the usual sprayings, and am not injured much by scab or insects, except the one that does this work.

ANS.—It was not the work of any insect, but the fruits showed a curious kind of dry rot due to a fungus disease. There were small, circular, dark-colored depressions in the skin of the apples, and often the skin had opened, leaving a circular hole. Below these spots the flesh was brown and pithy, extending to a depth of about one-quarter of an inch. Experts are not yet sure just what fungus causes this dry rot. Many varieties of apples are subject to the trouble. Thorough work with Bordeaux Mixture should check it theoretically, but it has appeared in trees sprayed six times. Therefore, no way of checking it has yet been discovered, it seems. M. V. SLINGERLAND.

Apples and Pears.

H. S. M., Canton, Ill.—1. Are the Northwestern Greening and Rhode Island the same apple? If not, which is the better apple? 2. Will the Kieffer pear bear as soon when a standard as when dwarf? 3. Is the Whitney apple one of the crabs, or is it a variety of the common apple? 4. Is the Twenty Ounce a desirable Fall apple?

ANS.—1. The Northwestern Greening is entirely distinct from the Rhode Island Greening. It is a variety that originated in Wisconsin, and is chiefly prized for its ability to endure severe cold. The fruit is large, very smooth and symmetrical, of only fair quality and ripens in the Fall in most sections. It is of no special value where the Rhode Island Greening is successfully grown. 2. The Kieffer pear bears so soon as a standard that there is no need whatever to use it as a dwarf. I have seen trees bear fruit at two years from the bud, and at four or five years old they usually bear abundantly. The greatest fault of the Kieffer, next to poor quality, is over-bearing. 3. The Whitney is more like the crab apples than like the true apples in size, appearance and quality. It is quite hardy in tree and only valuable where good apples are grown with great difficulty on account of severe Winters. 4. Twenty Ounce is a very good Fall Apple in most sections. It is large, beautifully striped with red and of fair quality. H. E. V. D.

Several Nursery Questions.

J. H. S., Wapakoneta, O.—1. What kind of an apple is the Winter Banana, and is it a good one? 2. What time of the year should I cut buds of peaches, plums and cherries? How should they be treated after cutting and before budding? 3. How can I start Carolina poplar best by the hundred? 4. Do you print a book of instructions to persons who are starting in the nursery business?

ANS.—1. Winter Banana is an apple much like the Maiden Blush in color, being yellow when fully ripe and usually with a beautiful red cheek. The size is about medium and the shape nearly round. The flavor is excellent. From what I have seen of the Banana apple I fear it will not keep later than midwinter in most sections. 2. Budding of all kinds of trees is usually done in August and September, and the buds are cut at that time. They should be kept moist and cool until used. I usually wrap them in wet paper and lay them in the cellar. 3. Carolina poplars start very easily from cuttings. They should be about a foot long and set out in early Spring in good mellow soil, and then cultivated as any other plants should be. 4. There is a very excellent book to be had called "The Nursery Book," by Prof. L. H. Bailey. THE R. N.-Y. can furnish it for $1.

H. E. V. D.

Fitzgerald Peach; Arctic Apple.

L. W. L., Natick, Mass.—1. How does the Fitzgerald peach compare with the Crawford as a market variety? 2. Will it pay to set a large orchard of the Arctic apple in Massachusetts? A few of my young trees bore this year for the first time, and they were very high colored, similar in this respect to the McIntosh.

ANS.—1. Fitzgerald is an excellent yellow peach that ripens about with the Late Crawford or a little later, and is liked by those who have tried it, so far as I have heard. It is a good market peach. 2. The Arctic is too new and untried to warrant setting more than a few trees. This at least is my opinion at present. I know the apples of this variety are apt to be very highly colored, and from a market standpoint it will probably be a good apple. The quality is not high, according to my taste. I also fear that the size may be a little too small, especially when the trees bear heavily. H. E. V. D.

Apples for Pennsylvania.

L. W. R., Scranton, Pa.—I intend to plant an apple orchard near this city on ground well drained, rolling and soil in fair condition; elevation about 800 feet. I want trees that are young, prolific and annual bearing; those that are hardy, fruit long keeping, good quality and good color. Please advise me on the following, and how near they fill the above requirements: Boskoop, Arkansas, Mammoth Black Twig, McIntosh, Ontario, Salome and Scott. Will you name varieties more suitable for my location, or more suitable for commercial purposes, that will cover the requirements? What can you say regarding spurry as a green manure to plow under?

ANS.—Our friend wants about "the whole thing" in the way of an apple orchard, and he is not to blame for such a desire. The great trouble comes in the extreme difficulty, if not the impossibility, of finding just what he and many others would like to have in the way of varieties of Winter apples. I do not know of a single one that does not have objectionable points, and some of them are seriously so. All those mentioned by him are probably quite unsuitable to his locality, which is central Pennsylvania. Boskoop is nothing extra in any respect, so far as I know, and it is practically untried as a commercial apple. Arkansas is a seedling of Winesap that is larger and quite successful where its parent does well, but is not of so good quality. McIntosh is an improvement on Fameuse in size and quality, but is not a late keeper. Ontario is not so good as Northern Spy in quality, nor is it so late a keeper, although it is one of its seedlings. I have been closely watching it during the past few months at the great Pan-American Exposition. Salome is neither large nor of high quality. Scott is a small red striped apple that is principally valuable for its ability to withstand severe Winters. While York Imperial has some faults it is perhaps as good as any Winter apple for Pennsylvania and many other sections. Rome Beauty is also a very good market apple and is good enough in quality for home use. Stayman is probably well worthy of trial there. I have never tried growing spurry, but am told it is a good crop for making humus when plowed under. H. E. V. D.

AMONG MAINE APPLE GROWERS.

The Maine Pomological Society held its Winter meeting in Dexter, Penobscot County, November 6 and 7. The Society scored a good point in the selection of date, and another in the place of its meeting. The weather was all that could have been hoped for and much finer than could have been anticipated for the season and latitude. Indeed, the Maine Autumn of 1901 will go down as a record season in the number of bright warm days and the fine opportunity thus presented for closing up farm work, gathering fruit, and preparing for Winter. Dexter and vicinity has been a notable fruit locality in Maine from the earliest times. The local growers vied with those who brought exhibits from a distance, and won their share of the liberal premiums hung up by the Society.

The meetings were well attended, but not to the extent of filling the galleries of the spacious town hall. The officers and other members of the Association were on the ground early, and by the hour for opening had a large and well-arranged display of Fall and Winter apples spread out on tables extending the length of the hall. Two tables on each side were separated from the wall, each other, and the seats for the audience by walks, while the pear and jelly exhibits were placed on either side of the entrance in the back of the hall. The flower exhibit occupied a prominent place on the front of the stage, and on tables just under the footlights.

President Gilbert called to order on the completion of the exhibit, and in a few well-chosen words greeted the members and citizens and opened the meeting with prayer by one of the Dexter pastors, and then introduced the first speaker, W. S. Brown, principal of the Dexter schools, who gave an address of welcome. The response was made by Secretary D. H. Knowlton. In this Secretary Knowlton referred to some of the conditions which make it needful for orchardists to confer in these meetings for the benefit of all, and also a few cases which make the future of orcharding in Maine bright to the intelligent persons in the craft. The proceedings of the morning session were concluded with music following the President's address. Every session of this meeting was enlivened by selections of good music. The afternoon programme consisted of four parts under the general head of "The Care of the Orchard," viz: "The Importance of It," by R. H. Libbey; "Methods of Culture," by V. P. De Coster; "Fertilization," by Chas. S. Pope; "Results of Culture," by John W. True. The first speaker, clinching his argument on the importance of care in the management of the orchard, cited a case of two orchards on two farms separated only by the line fence, and the difference between neighborly owners. One with no cultivation produced 10 to 15 barrels of apples, while the other for better care and cultivation yielded 200 barrels per year. A neighbor 80 years old had grown an orchard from apple pomace seed and lived to use some of the fruit. His successor had undertaken to improve this orchard. He has grafted 199 of the trees, and receiving a yield of 75 barrels of apples, finds this part of his operations to be paying better than any other. He will soon plant 200 more trees of good varieties.

Under "Methods of Culture," farmers were urged to raise their own trees; to graft in several ways. One case was cited where a boast was made of the large number of trees which had been set in a single day, but which was followed by serious loss of trees. It is safe to dig deep wide holes and plant the trees well; two feet deep by three feet wide in a circle is not too large a hole to set a small tree in, while they should in no case be set nearer than 30 feet. In cleft grafting let sprouts grow the first year to save scions from being pushed too fast. Prune for fruit, and thin the fruit well back to induce annual rather than biennial bearing. An orchard properly thinned, pruned and manured, should bear every year. The best time to prune is while you are bringing up the orchard to bearing; probably Fall and Winter are the best seasons. Plow and cultivate the orchard often. Some prune in June, which has been observed to spoil some trees. Thin the fruit any time after it is set, the sooner the better.

Under "Fertilization," which was taken up as manuring, the speaker spoke of the early richness of the soil when it was only necessary to plant a good tree in a pasture where the wealth of forest fertility had not been exhausted, and it would grow quickly to perfection. Now it is necessary to use commercial manure or the elements of plant growth in other ways by plowing and keeping turf well rotted when one has been grown, and the application of ashes and manures as they seem to be needed. Cultivate the first part of the season, and in August put in some mulch crop. Weeds are better than none to increase the vegetable fibers in the soil and help it hold more water. Rye, wheat, and peas were named. Stable manure was commended, but was said to contain too much nitrogen, and the suggestion was made to supplement a small application of it with lime, potash, chloride, ground bone, and phosphoric acid; afraid of ashes, as cost of elements may be too high.

Prof. Munson read a report of the Society's exhibit at the Pan-American Exposition. The Secretary could not attend to that display, and it was put into Prof. Munson's hands, and this report gave many details and facts concerning the exhibit and the keeping qualities of Maine apples which were sent to Buffalo to be shown. Under "Results of Culture," the speaker cited several cases brought up by previous speakers, and the presence of the fine display of fruit in the hall as evidence of the value of good culture, which would seem to make any further discussion superfluous. His mother's father had planted trees which fruited in seven years. Trees set in 1835 are now 30 or more inches in diameter, which speaks for the good culture these trees have received. Trees well set, but neglected, often are lost or ruined before five years. Keep grass down, especially Twitch grass, as it will sap the life of the trees early. Sometimes accidents and ice storms destroy trees, but these will be the small losses if trees are well cultivated.

At this session J. H. Hale, of South Glastonbury, Conn., entertained, instructed and enthused the audience with an illustrated lecture on fruit growing in Connecticut and Georgia. Mr. Hale included a large fund of humor and anecdote which pleases and instructs. The character sketch and folklore tales of the Georgia negroes were drawn on, and show that as devoted laborers those people have few equals and probably no superiors. It is not easy to give anything like a summary of this lecture without covering too much space. To be appreciated it must be heard, and the hearer then gathers something of the earnestness and enthusiasm of the speaker. R. N.-Y. readers should miss no opportunity to hear Mr. Hale on the subject of raising fine fruit for good markets, for he creates if he does not find a good market.

At the morning session on November 7 the reports of the officers were received. These showed a very satisfactory condition of affairs. Although the State Legislature had defeated every other call for an exhibit at the Pan-American Exposition, an appropriation of two hundred and fifty dollars was awarded this Society to help it make an exhibit of the State's fine fruit. With only an equal amount added from its slender means, a show so creditable as to medals received and approval by leading authorities attests the high quality of the small show made, and the care and economy with which this small sum was handled, when it was shown that the $500 appropriation was exceeded by less than $44 for all expenses of the exhibit.

The afternoon programme was disturbed by accident, and several parts omitted, the main part of the session being given to Messrs. Hale and Powell, of Washington, D. C., for talks on the general subject of orcharding. In the evening Mrs. Alonzo Towle delivered a very instructive and entertaining lecture on "Living for Health," and Mr. Powell an illustrated lecture on orcharding and clover crops.

The following officers were elected: Z. A. Gilbert, president; D. S. True and H. L. Lealand, vice-presidents; D. H. Knowlton, secretary; Chas. S. Pope, treasurer. Executive Committee: R. H. Libbey, V. P. De Costa, C. A. Arnold. Trustees: A. C. Day, J. W. Dudley, J. W. True, E. P. Purington, E. W. Worcester, E. A. Lapham, Alonzo Butler, A. J. Simmons, A. A. Eastman, Will E. Lealand, Frank E. Emery, Fred Atwood, G. W. Campbell, C. A. Hooper. Experiment station councilor, Chas. S. Pope.

F. E. E.

Grafting Grapes.

W. K. N. Dilley, Ore.—I wish to graft Niagara, Green Mountain and Diamond grapes to Worden and Concord. When is the proper time and what the best method? Can Delawares be grafted to Concord?

ANS.—Yes, all the varieties mentioned can be grafted successfully on Worden and Concord. Early Spring is the proper time to do the work. The cleft method is the one most suitable, especially where the vines are large. The union must be below the surface of the ground, and the earth well packed around it, and so high as to leave but one bud above the surface. H. E. V. D.

Feeding Hens; Rape for Green Manure.

T. S., Camden Co., N. J.—1. What is considered a proper quantity to feed at once to 12 hens and 12 four-months-old chickens? 2. What would you advise for Dwarf Essex rape about 12 inches high now; that is, when plow under to benefit the ground most? I would like it to remain as long as practicable to serve as a cover, the soil being very sandy and inclined to blow very much.

ANS.—1. We have found in our experience that five ounces of dry grain food is quite ample for a fair-sized hen. Of course much depends on the size of the hen's run. If at wide range less grain will be needed. If kept yarded closely green food of some sort must be added. For the 24 birds if closely yarded we should feed about seven pounds of grain—not all of one kind—in two rations, night and morning. 2. We should let the rape grow. It will keep alive until Christmas anyway, and some of it may even last until next year. Let it grow as long as it will and plow it under next Spring.

Sutton Apple in Northern New York.

R. M. P., Fruit Valley, N. Y.—Will Sutton apples do well in northern New York, and will it be well to graft into Baldwin trees? Will they bear every year under high cultivation and spraying?

ANS.—Sutton is thought to be a little more hardy than Baldwin, and will flourish wherever that variety does. I can see no reason why it should not do well in northern New York. Many fruit growers are putting to a test the question of the probable advisability of grafting over Baldwin trees to Sutton. In my opinion it will prove a benefit. Sutton is said to bear much more regularly than Baldwin, but there are very few varieties that will bear every year under any conditions. Spraying, thinning and good tillage will do much to bring about regular and profitable bearing. H. E. V. D.

Bowker's Animal Meal is the best food for fowls. It is better than scraps, because it is finer, cleaner, contains less water, more bone and more protein. It is better than bone alone, because it supplies bone in connection with thoroughly cooked meat. It is better than shells, because it supplies not only the lime necessary for the shell, but also the constituents required to make meat of the egg For sale by dealers generally.

UNCLE SAM'S SEPARATOR
HAS GROWN TO SUCH LARGE PROPORTIONS THAT IT IS
AN ELEPHANT TO THE DE LAVAL PEOPLE

The U. S. Separator is such a bugbear to them that they expect an elephant in everything connected with it, so it is not surprising to find them using an elephant to run a U. S. Separator with; neither is it surprising to see tears in the eyes of the elephant. It is enough to make an elephant weep to have to do work that a dog he could play ball with could do easily.
That a dog can run a U. S. Separator will be seen by reading the following letter:

84-lb. Dog Runs No. 7 U. S. Separator Without Trouble.

MINOT, ME., Sept. 10, 1901.
I see your competitors, the De Laval Co., are passing out circulars at fairs, showing an elephant running a dog-power, and printing the statement that it requires much power to run one of the U. S. Separators.
Now I have run one of your No. 7 new capacity machines for more than a year, and operated the same by dog-power. My dog weighs only 84 lbs., and commenced to run the separator when he was only four months old. I have no trouble in maintaining the required speed, and am greatly pleased with the separator and power.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

A NEW RASPBERRY-BLACKBERRY HYBRID.—The careful experiments in hybridizing blackberries with raspberries carried on by the late E. S. Carman did not result in varieties of commercial value, and the same may be said of all attempts to unite the characteristics of these useful fruits until Judge J. H. Logan, Santa Cruz, Cal., originated the now famous Loganberry, which sprang from seeds of the native Californian dewberry pollinated with a red raspberry of European origin. The Loganberry did not prove successful here in the East, but is grown commercially in California, and is steadily gaining favor in England, as it shows a special adaptability to the climate. It is becoming a feature of the Summer fruit shows over there. The defects here are tenderness of plant as regards Winter exposure, and limited productivencss, probably owing to injury of canes and buds by cold. The fruits are large and attractive, but the plant is rapidly going out of cultivation east of the Rocky Mountains. Now comes The Mahdi, a novelty resulting from crossing the raspberry Belle de Fontenoy with the common European bramble or running blackberry. It is said to be superior in flavor to the Loganberry, and perfectly hardy in England. Fig. 355 shows the form of the berries, which appear like very large violet-red blackberries, but more rounded in shape. The foliage is midway between the parents, and very luxuriant, while the plants are rapid growers and very prolific under British culture, ripening in late July and early August. These favorable reports do not necessarily imply that The Mahdi will succeed with us, as few berries of European origin are able to withstand our climate.

RURAL GROUNDS PRODUCTS.—It is always gratifying to get encouraging reports of new varieties of plants originating on the Rural Grounds. So many promising novelties fail to adapt themselves to changed surroundings and conditions that some self-congratulation over plants maintaining their good quality in distant places seems permissible. The new Gladiolus hybridus princeps, the gem of more than 100,000 hybrids, which has gained commendation wherever shown in this country, was given an award of merit at a late exhibition of the Royal Horticultural Society of London, and the following report of the behavior of the hybrid Canna flaccida Pennsylvania, comes from a point as far distant in the opposite direction.

The Canna Pennsylvania has one cluster full of bloom and one cluster of buds coming on. I have just measured the blooms; they are each just six inches across. They stand the sun here as well as the Crozy type. The petals seem to be of more substance than any of the orchid-flowered type which I have seen. The petals do not stand out as regular and stiff as I would like to see them, but it is a great advance in its thick petals and ability to stand our sunshine. LUTHER BURBANK.

Santa Rosa, Cal.

THE RIGHT SOIL FOR KIEFFER PEARS.—Each recurring season emphasizes the fact that the Kieffer pear grown on thin sandy or gravelly upland is a very different and much more acceptable fruit than his companion grown on rich or heavy loam. Planted on soils of the latter character the trees make a thrifty growth, and bear heavily after attaining sufficient size, but the large size, dull and rusty coloring, gritty consistency and watery taste of the pears do not encourage sales at paying prices. The trees are slow in bearing as a rule on thin light soils, but the pears, if picked soon after the seeds color, and packed away in boxes or barrels under shelter, soon color brightly and soften to the core, developing a brisk and pleasant flavor, though they remain too coarse in texture to compare favorably with standard dessert varieties. The clear, waxy yellow coloring occasionally relieved by a deep red flush, renders a properly ripened Kieffer, if grown on congenial soil, the most attractive pear of its season, while those from low and heavy soils are nearly all dull and cloudy. Growers are convinced of this difference, which is emphasized by the hard logic of dull sales and low prices for cloudy and rusty fruits, no matter how well developed, and fewer trees will be planted hereafter on uncongenial soil. Heavy soil and high fertilization, while favoring large crops of fruit, also encourage the tendency to blight, and most of the older Kieffer orchards are now seriously affected by the disease. It was supposed at the introduction of this vigorous pear that the trees once established would go on bearing indefinitely, but the impression is now gaining that 12 to 15 crops are all that should be expected from the Kieffer, even under the most favorable treatment. Orchards about Freehold, N. J., planted 17 to 20 years ago, are falling off so seriously in earning capacity that they are likely to be replaced with other fruits, though they have been highly profitable in the past. Brightly colored and well-ripened Kieffers will probably be wanted for a long time, but the market is glutted with undersized and cloudy fruits, which it consumes with difficulty. It may be that the sand pear hybrids in the future will be grown on thin soils where it is now considered unprofitable to plant tree fruits.

W. V. F.

Pears in Illinois.

In THE R. N.-Y., issue of October 12, H.E.V.D. asks for information regarding the Koonce pear. I have 20 bearing trees in my orchard. I found that they did not start as readily after transplanting as the other varieties. The second year they made up in growth for all their backwardness the first season, and now I find them equal to the Kieffer in the length of new growth of wood. They are very little behind the Keiffer in earliness of bearing, usually from three to five years from planting. The fruit is medium size, very good quality—better than Vermont Beauty, but will not sell as well, for it lacks the color, that beautiful crimson blush which creates a sensation of hunger when you look at it. Keiffer is the money-maker, but needs a pollenizer, and Vermont Beauty fills the bill. It helps the color and the quality. S. E. HALL.

Winter Cover for Dewberries.

On page 676 of THE R. N.-Y., E. T. B., of Whitewood, S. D., asks information about Winter covering for dewberries. I used to have the same trouble. From his description I think the climate is colder here, and the other conditions similar to those at Whitewood. We have the bare ground and drying winds. Here the fruit buds of the Lucretia dewberry will kill every Winter, and the stalks nearly every Winter, without protection. My experience in covering them with earth corresponds with that of E. T. B. I think the failure is due to the fact that the wood is made tender by the close covering of earth. If E. T. B. will cover his vines with a thin layer of cornstalks after the ground is frozen an inch or two, just enough to keep them frozen and prevent their thawing out every warm day and freezing up every night, he will have gained his point. Do not remove this cover until the buds have started, and some show tiny leaves. When the cover is removed lift the vines and tie them to the top of a stake three or four feet from the ground. Do not bring them up straight to the stake, but in a half bow, and cut them off six inches beyond where they are tied. Use the stalks for a mulch, and I am sure the results will be an abundance of fruit. S. E. H.

Cherry Valley, Ill.

Preparing Soil for Strawberries.

In regard to L. R.'s inquiry about manure or fertilizer for strawberries, page 708, I have a piece of ground in preparation to plant to strawberries next Spring. After cutting the grass I sowed cow peas July 3 (the Whippoorwill). Early in October I plowed in a good crop of vines and sowed rye. In the Spring I shall plow in the rye and put hen manure and commercial fertilizer in the row, and work into the soil before planting. I should avoid common stable manure, as it is apt to be full of weed and grass sceds, which will be very difficult to deal with among the vines. Would you not subsatitute sulphate of potash for the muriate? Some good authorities object to the muriate, as the chlorine in it is injurious to certain plants, strawberries among them, and advise using sulphate instead. By growing and plowing in a crop each f cow peas and rye I destroy the weeds and put into the soil a large quantity of vegetable matter which preserves the moisture and greatly lengthens the bearing season, and no quantity of commercial fertilizer will ever serve as a substitute for it. Thus I get vegetable matter and humus without the weeds usually found in stable manure. H.

South Hadley, Mass.

R. N.-Y.—That is a good preparation for strawberries. The sulphate of potash is said to give a better flavor to fruits like strawberries. Otherwise, the muriate is, we believe, just as good.

MORE ABOUT THE KIEFFER PEAR.—I have read with considerable interest the numerous notes on the Kieffer pear in your paper, and it seems strange to me that no one offers any suggestions as to how the Kieffer may be made to stand in a different light. If Kieffer pears are picked in September and properly ripened, they are a very good pear to eat, free from grit or woodiness, and I find that when they are in perfect condition they are nearly equal to Bartletts, but the trouble is they are left on the tree till the last of October and they change entirely, and then no matter how ripened will be gritty at the core. Surely no one who has ever had Kieffers properly canned, that is, has had the pear in the right condition, and then properly treated and put in the can, would say that a canned Bartlett can compare with it. The best Kieffers are selling in Philadelphia now at 50 cents per five-eighths basket. Lawrence does not bring more. The trouble in growing Kieffers is to keep them clear of rust, and to get them to color, that is have a red cheek. If that can be done there is no danger but what the growing of such fruit will be profitable.

HOPE FARM NOTES

TAX TIME.—I print the tax rate on Hope Farm for comparison.

	1900.	1901.
County tax	.35	.38
Bounty and interest	.039	.038
County poor	.019	.027
State school	.28	.17
Borough purposes	.27	.27
Deficiency and interest	.026	—
Special school	.40	.60
	1.384	1.485

As will be noticed, this year's rate is higher than last, the increase being largely in a special school tax. We spend a little more on the county poor, and it costs a trifle more to run our county business. The State school tax is lower, and we are told that before many years it will be wiped out. Who is to pay it? The trusts or big corporations which are chartered in our State, and which pay our State tax for us. Personally, I do not care to have any trust or saloonkeeper pay the share of public expense which justly belongs to me. New Jersey is already called the Mother of Trusts. The money which they pay into our State treasury represents a small part of the blood money which they have squeezed out of the public. They practically own the State now. The average public man who opposes them will be flattened out until he resembles a pancake with no baking powder in it.

FINE CORN WEATHER.—Yes, cool, breezy weather in the late Fall is fine for the corn crop—after it is cut. Our husking is over, and the fodder will all be under cover, I hope, before this is printed. We have never had better fodder. It was put in small shocks (24 hills) and after husking about a dozen shocks were set up together. The crisp, drying winds cured the shocks like clover hay in the cock. They are crisp and green, with a flavor and perfume like a delicate extract of silage. When run through our shredder they will make excellent horse feed. The value of a good corn crop is pronounced this year. Cash corn in Chicago is quoted at a trifle over $1 per 100 pounds, while our local miller charges $1.35. Thus corn is one of the most expensive feeds we can buy. I sometimes think it would pay me to sell the corn and buy other grain, but after all home-grown corn is one of the most satisfactory grains one can have in the barn.

FEED NOTES.—I have bought a lot of dried brewer's grains to feed as an experiment. The analysis shows that they are richer than either bran or oats, but I have observed that Frank, Nellie and the rest of the barn stock do not always agree with the chemist. Tongue and stomach do not always check off the work of flask and test-tube. We are feeding the grains to horses, poultry, hogs and cows. Thus far the animals all seem to do well on them, though I think it would be better to mix them half and half with bran. They look about as dry and unwholesome as little pieces of sticks, yet there can be no doubt that they analyze well. The nubbins and soft ears are reserved for "pig corn." We are feeding the sows a fair amount of corn, with plenty of bulky food like turnips, cabbage and rape. About the middle of December we shall begin feeding them linseed meal. They now have a small ration of dried brewer's grains and middlings. They have all the wood ashes and corncob charcoal they want. We have eight brood sows all told this year—four of them purebred Berkshires. The grade sows were profitable last year, and so we shall keep them one season more at least. I studied over this quite a little. We sold one hog for $14.90 dressed. At the same rate per pound the two grade sows would have brought $25 at least. Would it not have been good business to turn them off? They raised 18 pigs this year. We sold 12 of them for $33, ate two and have four left, one of which we shall use for a brood sow. The account for these sows stands as follows: Pigs sold, $33; consumed, $6; on hand, $20; total, $59. This represented but one litter for each sow, remember. Had we sold them as pork for $25 they would have given an income of $84. I argued that they may be expected to duplicate their performance of this year, give an extra litter and then sell well as pork. So instead of knifing them we will fork out another year's feed.

BAD CALCULATING.—The following letter created quite a little amusement at Hope Farm:

Mr. Hope Fa'm Man:

Dir Sur: In yure lettir tu las weak's R. n.y., yu saz that yu be goin tu so rye az late az Nov. 10. Well, I must tell ye that up in this neck uv the woods we're goin tu knock off frum labor *Saturda night*, Nov. 9—even ef we dont go tu meetin nex day. Sowin rye on the Sawbath is worser nor settin on the fents and ponderin.

Yoors trooly,

Sodus, N. Y. G. HAW BUCK.

I don't know whether I have the pleasure of Mr. Haw Buck's acquaintance or not, but he is O. K. when he says that sowing rye is a worse Sunday job than sowing reflections on a stone wall. I'll have to admit that when I set a date for late rye seeding I didn't look it up to see what day it came on. This gives me a chance to say that I think rye seeded up to Thanksgiving this Fall will make a fair crop next year. It's a cold-blooded plant. Do you know that it is a comfort sometimes to realize that your chances are in the hands of some cool-blooded, honest friend when the way is hard and rough? Some folks when they "ponder" may not sow rye, but they sow riot unless they are able to keep their thoughts to themselves!

HEN GIRLS.—New wine seems to have been put into the old bottles of the Hope Farm hen business. Let's see if the bottles burst. Our hens have been neglected. The men folks have been too busy to bother with them, and the pullets got in the habit of crowding into corners of the yard, while a number of sick birds went drooping about. This was bad business for November, but The Sprout came to the rescue with a proposition to take charge of the chickens. She has had some experience with a small flock and did well. I decided to set her up in partnership with the Bud. They are to take charge of the birds, see that they are well fed and cared for, pay half the cost of feed and have half the sales. At the end of six months, if they do well, the ownership of the flock will pass into their hands. The Sprout was much interested in the advice offered that girl who recently asked for home work in THE R. N.-Y. She thinks she can make these hens pay. The girls went right at work. First they picked out all the young roosters and put them in a small house by themselves, where they are fed on corn with warm water to drink. They expect that these young fellows can be sold for enough to feed the hens until there is an income from eggs. Then they put the droopy and sick birds by themselves in a dry hospital. They may be cured and made useful members of the henyard if they have a chance, otherwise they would surely have died. For several nights it was a big job catching the wanderers and making them go into the house. I helped one night, and did so much running that I don't dare to say how many times I passed my plate at supper. I used to play a good short stop on the diamond, but I'm out of practice, and the chickens slid past my fingers with ease. I think these hen girls are going to make our poultry department respectable.

ORCHARD PROBLEMS.—The Hope Farm orchard puzzle may be stated about as follows:

Steep, rocky hillsides! The soil is heavy and in places the ledge comes close to the surface. The few apple trees now growing on these slopes are strong and vigorous. The man is not as young as he used to be, and wants if possible to eat some of the apples while he is yet able to climb a tree after them. Varieties are wanted that will ripen at the best time for selling, keep well and make people call for more. How are we to get an orchard of good varieties into bearing on these hillsides in the shortest time?

I could fill a book with the advice I have had about this. In a general way it seems to me a sensible thing to plant seedlings of Northern Spy—if possible. Get them well started and then go to some first-class orchard and get wood from the best trees, true to name, which have given reliable crops for years. Use this wood for budding. I think that in this way we shall hurry up the bearing, and surely know what the trees are going to produce. As a part of the scheme, Hugh is thinking of taking the short course at Cornell this Winter, so as to learn all he can about the care of a tree.

MEN WANTED.—I judge from what people say and write that the help problem is about the toughest proposition there is on many farms. It is hardest near large towns and cities, because there it is easier for men and girls to obtain other jobs. Those who do work on the farms in such locations pick up the time and the habits of the factory workers—not all of which are suited to farm conditions. I print the following note, as it indicates the sort of job that can be had by those who are capable of filling it:

I want a truck gardener and farmer. I have about five or six acres of garden. The ground is productive, and the market a good one. I have glass for 10 hotbeds. I will give the gardener $15 per month and house, and 10 per cent on what he sells or furnishes the house. We consume a good lot, as we have about 65 persons in the house—except in Summer (three months) when we have but about 10 or 15. I want also a man to milk and take care of six cows and help the gardener, etc. His wages are $15 per month and house. Can I get such persons from your region?

This refers to a school for boys in Pennsylvania. I put it here as an experiment, to see how many readers would like such a job. The pay will seem small to first-class gardeners, but the 10 per cent of sales to such a school ought to bring it up. Wages of skilled labor in other lines of work are pretty high just now, and I believe it is quite easy for skilled farmers to command good returns for their labor. But who wants such a job as is described above?

H. W. C.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal". See our guarantee 8th page.

NURSING MOTHERS

A mother's poor health is bad enough for the mother but worse still for the nursing baby.

Mothers find Scott's Emulsion a nourishing and strengthening food. If the breast milk is scanty or thin Scott's Emulsion will make it rich and more abundant.

When mothers take Scott's Emulsion the babies share in the benefits. Thin babies grow fat. Weak babies get strong.

We'll send you a little to try, if you like.
SCOTT & BOWNE, 409 Pearl street, New York.

I will Cure You of

Rheumatism.

No Pay Until You Know It.

After 2,000 experiments, I have learned how to cure rheumatism. Not to turn bony joints into flesh again; that is impossible. But I can cure the disease always, at any stage, and forever.

I ask for no money. Simply write me a postal and I will send you an order on your nearest druggist for six bottles of Dr. Shoop's Rheumatic Cure, for every druggist keeps it. Use it for a month, and if it does what I claim pay your druggist $5.50 for it. If it doesn't I will pay him myself.

I have no samples. Any medicine that can affect rheumatism with but a few doses must be drugged to the verge of danger. I use no such drugs. It is folly to take them. You must get the disease out of the blood.

My remedy does that, even the most difficult, obstinate cases. No matter how impossible this seems to you, I know it and I take the risk. I have cured tens of thousands of cases in this way, and my records show that 39 out of 40 who get those six bottles pay, and pay gladly. I have learned that people in general are honest with a physician who cures them. That is all I ask. If I fail I don't expect a penny from you.

Simply write me a postal card or letter. Let me send you an order for the medicine. Take it for a month, for it won't harm you anyway. If it cures, pay $5.50. I leave that entirely to you. I will mail you a book that tells how I do it. Address Dr. Shoop, Box 570, Racine, Wis.

Mild cases, not chronic, are often cured by one or two bottles. At all druggists.

The Rural New-Yorker

THE BUSINESS FARMER'S PAPER.

A National Weekly Journal for Country and Suburban Homes.

Established 1850.

HERBERT W. COLLINGWOOD, Editor.
DR. WALTER VAN FLEET, H. E. VAN DEMAN, MRS. E. T. ROYLE, } Associates.
JOHN J. DILLON, Business Manager.

SUBSCRIPTION: ONE DOLLAR A YEAR.

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs.

"A SQUARE DEAL."

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

Name and address of sender, and what the remittance is for, should appear in every letter.
Remittances may be made in money order, express order, personal check or bank draft.

THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, NOVEMBER 23, 1901.

AT the request of a reader we are collecting figures to show the cost of growing an acre of corn in the corn-growing States of the Middle West. Mr. Shamel gives a synopsis of many figures on page 786, and we shall have reports from many individual farmers. Eastern farmers must remember that on these great, level western fields powerful machinery can be used, which greatly reduces the cost for a single acre.

*

PROF. C. L. Marlatt, Assistant Entomologist of the Department of Agriculture has found, in northern China, the original home of the San José scale! He has also found an insect—a species of ladybug—which in that latitude keeps the scale in check. Specimens of this parasite are on their way to this country. The importance of this discovery can hardly be estimated. If the parasite will live in this climate and continue its work, we shall be able to destroy the scale as completely as is done in California.

*

WE regret to say that some of our readers seem to be running away with the cow-pea question. We have tried hard to make the following points clear:

1. It is a hot-weather plant, and will never come up if put in the soil before corn-planting time.

2. It will die at the first frost and will not make a green cover for Winter.

3. It is not, in our opinion, a first-class forage crop for the North.

4. We suggest its use only on poor, worn-out fields which will not give good crops without heavy dressings of manure or fertilizers.

5. We would not plant it on any soil good enough to produce a fair corn crop, and we would plow vines all under.

There is plenty of room for the cow pea on our poor, neglected fields, but please do not disregard the above statements, and then say that THE R. N.-Y. fooled the people about cow peas!

*

"FOR ways that are dark and tricks that are vain, the Heathen Chinee is peculiar," wrote a humorous western poet some years ago. Had the poet been a resident of New Jersey at the present time he might have substituted "oleo seller" for the tricky Celestial without doing violence to the facts. The oleo business is peculiar all along the line. It was conceived in fraud and iniquity and is carried on with great ingenuity for the purpose, not of supplying a cheap, useful food product, but of foisting off inferior substitutes at the price and in the place of real butter. One of the newer dodges is for the alleged butter dealer to take out an oleo license, which does not cost much in New Jersey, and offer the article when called for, while decrying its value. If oleo is demanded, a pale waxy grease, scarcely fit for lubricating purposes, is furnished at a moderate price, and when butter is wanted, and paid for at prime butter prices, a fairly palatable and highly colored brand of oleo is supplied. Thus the buyer is wronged either way, and the dealer's profits much increased. The risk of an occasional fine is taken as part of the game. The public is quite effectually hoodwinked by the affectation of fairness, and the consumption of and taste for good butter much lessened. The passage and enforcement of a law similar to the Grout bill would go far to break up these detestable frauds, as colored oleo would be an expensive and dangerous thing to handle.

NOT long ago we heard a business man remark in a sneering way: "I have found that the farmers who go to farmers' institutes are usually the ones who do not buy goods or pay their debts." He was trying to show that the experiment stations and the institutes had been of no particular benefit to farmers. Investigation showed that he was selling an article for which he claimed great results. The chemists had analyzed his stuff, and found that a mixture of common articles which farmers understand can be made at half the price of the manufactured goods, and prove even more effective. The institute speakers had given these facts to the farmers, and it was true that they did not buy the goods, and hence did not pay for them! We think that the farmers of this country can stand a great deal of just such instruction as that. The more these myths and big stories are pricked by the sharp point of science, the better for all except the rogues who have, in years past, stuffed their pockets with double profits.

*

THE picture on our first page is taken from Wheat Growing, an excellent pamphlet issued by the United States Department of Agriculture. Four years ago there was a "wheat blockade" in the famous Palouse country of Washington. Thousands of bushels of sacked wheat were piled up at the railroad stations, waiting for trains to haul the loads away. This Palouse country is blessed not only with a soil that seems inexhaustible, but with harvest weather that seldom shows rain. Thrashed grain may lie upon the ground in sacks with perfect safety, and farmers haul it at their convenience. There is no watching the sky to dodge in ahead of a shower. These vast piles of cheap wheat might discourage some eastern grain growers, whose fields are small and whose soil is poor. They must remember the millions of mouths that are to be fed on each side of the ocean and that the way to compete with extensive culture on new land is to practise intensive culture on old soil.

*

THE account of good local profits from potatoes on page 787 is as correct as careful investigation can make it, and may be accepted as rather an under statement of the facts. The yields are not at all phenomenal, but in connection with the prevailing good prices for potatoes make a comfortable showing for the growers. The combination of a local good crop in the face of partial failure over large areas, and a brisk demand at high prices, may not again occur, and some of the growers are apprehensive that over planting may follow an account of their good fortune. The salient fact, however, remains that the successful growers have mastered the art of potato culture by persistent and intelligent efforts through a long series of seasons, good, bad and indifferent. The three requisites of good seed, ample fertilization and thorough, unsparing cultivation, can do much to offset an unfavorable growing season. If next year's operations fail to return more than a working profit, we venture to say that these experienced potato men will be less disappointed than the beginners who may be tempted to make a hurried investment in a poorly prepared potato patch.

*

THE R. N.-Y. has favored some features of the centralized school system. Under this plan the district schools are abandoned and pupils are carried back and forth in a public conveyance to the village school. We saw this plan in operation at one locality in Ohio, where everybody seemed to be well satisfied. The following letter from a reader in Jefferson County, N. Y., certainly gives another side to the matter:

> We have a district school here closed by a one majority vote without furnishing conveyance, and this compels five children of poor parents to stay at home. The well-to-do farmers are sending their children to a village school with the public money these children have a right to, or at least their share. The school closed is 3½ miles from the village school. The centralized school law is all right as intended, but unless forced to furnish conveyance it gives the parties having a little spite, or those looking for a cent at any one's expense, a decided advantage. It depreciates the value of farm property, both selling and renting. It gives those close by the village school a privilege at the expense of those farther out who can't go. It takes the poor man's only privilege of educating his children. It causes irregular attendance. Even with conveyance, who wants their little eight-year-old girls to be toted off four or five miles, night and morning, with some stranger, with mud up to the axle or snow up to horses' backs, as it is here in northern New York, when the school house is within half a mile? The vote that closed the school had no interest other than saving the little tax.

The facts as above stated show a case of injustice. No man or set of men should have the right to take the district school away from poor children without putting them within reach of another school. We do not understand all the circumstances connected with this case, but it seems reasonable to suppose that there are townships where this centralized school system cannot be enforced without annoyance or injustice to some one. Will those who live where it is being tried tell us how it works?

*

LAST Spring we received a call from P. O. Wannieck, an Austrian who has large fruit orchards in his own country. Mr. Wannieck came here to study the American system of orcharding. Strange as it may seem, he says, after visiting most of our apple-growing sections, that he expects to ship fruit to America! He says:

> One reason why American apples are not more popular on the Continent is that your exporters send us comparatively few varieties aside from the Ben Davis, which has no virtues but its beautiful colors and shipping qualities. Our trade, particularly in the German States, does not care for the big red apple, and buys in preference the one that is green, but of fine flavor and texture. We can produce fruit cheaper than you can in this country, because labor costs us but a third as much, and the problem of exporting profitably resolves itself into a question of transportation.

There you have the work of Ben Davis again. According to the last reports from the English apple markets, Missouri Ben Davis sold at $5.35 to $5.84 per barrel, Albemarle Pippin brought $6.33, King $7.78, and California Pippins $2.92 per box of one bushel! It will be nice business if the American Apple Consumers' League succeed in doubling the demand for fine eating apples in our eastern cities only to have the Californians and Europeans step in and capture the trade!

*

RHODE Island is a little State with only 5,498 farms—two less than 10 years ago. The soil for the most part is not rich, and has been under cultivation for more than two centuries. There are only 113 more farms in the State than there were in 1850, while in that time 169,133 acres have gone out of cultivation. The average size of the farm is now 83 acres, against 103 in 1850. Yet, with this decreased acreage under the plow, the total farm wealth of the State has increased $7,888,549, while the value of one year's farm products has doubled. This means that certain unproductive lands have been thrown out of cultivation, so that the farm work might be concentrated on fewer acres. Naturally the production of grain and the fattening of live stock have decreased, and fruit, vegetables and poultry have taken their place. The average income from an acre of potatoes was $75.72, while an acre of grain averaged only $17.97. Western competition has injured the Rhode Island farmer's business in beef and pork, and the oleo manufacturers have nearly destroyed the dairy business, but the hen helps out. The year's output of poultry and eggs was valued at $1,055,635, which would have bought all the horses and all the sheep in the State. It would also have bought all the milch cows and all the swine. Thus it appears that after 250 years of cultivation the farms of Rhode Island produce a greater value than ever. The land that goes out of cultivation should never have been cleared in the first place, and new crops and new stock have more than doubled the average income from an acre of cultivated land.

*

BREVITIES.

You never will carry a brimming pail
From a cow that droops with a "hollow tail."
For whoever heard of a tail all hollow
In a cow that has all she needs to swallow
Of a ration balanced to meet her need
Of roughage and plenty of clean, sweet feed?
It's the cow that droops by the windy stack,
Describing a circle with her poor back.
With nothing to drink but a chunk of ice,
And nothing to eat but a frozen slice
Of wheat straw sandwich—that sad and forlorn,
Comes down with a case of the hollow horn.
It's hollow stomach that brings her to grief,
So make her contented or make her beef.

PRINT facts rather than fakes.

THE best blow for self-criticism is a hit on the I.

THE Mother apple ought to make superior vinegar.

"YES," said the man as he made his "kick," "I deny that in toe toe!"

SEE what Mr. Keesling says about California apples—no red ones wanted!

Now that feeds are so high it's a good time to get rid of the low-grade cows.

WANTED—Sound reasons why there should not be an issue of fractional currency.

BEFORE you lay down the law about important matters be sure you know what you are talking about.

ARE we right in saying that a fair-sized hen should have the equivalent of five ounces of dry grain each day?

THE cause of "hollow heart" in potatoes is obscure, but the "holler" heart in man is caused by moral cowardice.

SOME people falter at their stent, and thus they never rise past "gent"; while others by self-culture can earn the grand name of gentleman.

WE commend Mr. Van Alstyne's article on the first page as pretty close to a model for readable, boiled-down fact and suggestion. It is the cream of the "Model Dairy" experience—well churned and stamped!

Events of the Week

DOMESTIC.—A fire in the Klondike Theater, at Hurley, Wis., November 6, killed 10 persons and injured four others, and it was only by strenuous work that the fire was prevented from destroying the entire town. The same theater, which was a vaudeville house, was burned down in July, 1887, when 11 women were burned to death. . . . . The Lyceum Theater, Atlanta, Ga., was burned November 7. The audience escaped without a panic, and no lives were lost. Loss $75,000. . . . . Oberlin M. Carter, formerly Captain in the United States Engineer Corps, and now a prisoner in the Federal prison at Fort Leavenworth, Kansas, is to have a rehearing of his case in the United States Circuit Court in Chicago. An agreement to this effect has been reached, growing out of the Government's effort to recover from Carter's relatives the proceeds of the alleged embezzlement. . . . . The thirteenth fatal case of lockjaw resulting from the injection of antitoxin for the treatment of diphtheria was reported in St. Louis, Mo., November 6. Charles Cytron, 11 years old, was the victim. . . . . Five blocks of the business portion of Jennings, La., were destroyed by fire November 5; loss $160,000. . . . . While blowing up stumps with dynamite near Bloomington, Ill., November 8, one man was killed, another fatally injured, and four others seriously hurt. . . . . November 8 26 convicts escaped from the Federal prison stockade near Leavenworth, Kan.; in the struggle one prisoner was killed and two guards wounded. . . . . November 11 an explosion in a chemical laboratory in Philadelphia, Pa., caused $52,000 damage and seriously injured 10 persons. The cause is supposed to be a defect in the pressure pan in which thermol was manufactured, allowing the gas to escape. The company denies that there were any high explosives in the building. . . . . The Paterson (N. J.) Steel and Iron Works suffered a loss of $100,000 by fire, and 100 men were thrown out of employment. . . . . Alabama has adopted by general vote the new constitution. It is said that this will eliminate 95 per cent of the negro vote, as educational or property qualifications are required of all who were not soldiers or their descendents. . . . . The leader of the escaped Kansas convicts has been captured after a fight in which he was wounded. Eight of the convicts are still at large. . . . . Wholesale adulteration of tub oysters with borax and formaldehyde has been discovered by Pure Food Inspector James Foust in Blair, Cambria, Somerset, Bedford, Clearfield, and Centre counties, Pa., and 30 dealers will be arrested within a week. Of 80 samples submitted to State Chemist Frear 43 were found to contain the preservatives. The discovery, so far as known, is the first oyster adulteration brought before the State Department.

ADMINISTRATION.—Secretary Root has issued an order changing the regulations relative to admissions to West Point, so that the Academic Board may accept candidates who are graduates of high schools or students of colleges and universities, without requiring them to pass the mental examination prescribed by the Department. . . . . Finding it impolitic to acquire a coaling station on the shores of the Caribbean Sea by direct negotiation, Germany has, apparently, attempted to evade the Monroe Doctrine by obtaining control of territory for this purpose through one of her subsidized steamship lines. . . . . An official report has been received by the State Department from Joseph Bowron, United States Consul at Cartagena, announcing that the Hamburg-American Steamship Company, owners of the Atlas Line, which plies between Central and South American ports, had filed an application with the Colombian Government for the right to establish a coaling station near that city. While there is no disposition on the part of the United States to interfere with private enterprise, there is no doubt that the Administration would prefer that application of the Hamburg-American Line be not granted. That company draws a subsidy from the German government, and in case of war its steamers would be available for use by the German government as auxiliary cruisers. A coal pile near Cartagena would be of immense value, as a fleet using it as a base would, if sufficiently strong, be able to dominate the Carribbean Sea for the eastern terminus of the isthmian canal. The strategic importance of a coaling station at or near Cartagena is hard to overestimate. The application of the Hamburg-American Line is regarded not only in official, but in diplomatic circles, as the thin edge of the wedge intended to split the Monroe Doctrine.

PHILIPPINES.—During October and November about 550 teachers have arrived in the Philippines and have been assigned to various places throughout the archipelago, making about 750 teachers in the field. These are assisted by about 200 soldiers, who have been detailed. About 75,000 Filipino children are having English instruction. There are about 4,000 or 5,000 Filipino teachers and the majority of these are having one hour a day of English. A normal school has been opened with an attendance of about 250 Filipinos, and a trade and agricultural school has also been opened. . . . . General Smith has issued orders forbidding the purchase of hemp in the Island of Leyte except in small quantities for food, which purchases must be under the supervision of the military authorities. All the ports of Leyte are closed and traffic is forbidden where it cannot be supervised by the military.

GENERAL FOREIGN NEWS.—Bubonic plague has reappeared at Glasgow, Scotland, and Liverpool, England. . . . . Earthquakes of from moderate to strong force occurred every night in western Nicaragua from October 6 to 14 inclusive. The disturbances of October 6 were followed by tidal waves, causing the drowning of five or six natives and many cattle, and the destruction of several houses. The waters, in receding, carried into the ocean a large number of valuable dyewood logs which had been prepared for export. . . . . Li Hung Chang, the distinguished Chinese diplomat, died at Pekin November 7. Earl Li had a longer and more thorough knowledge of foreign affairs than any other Chinaman. In the early sixties he was the only high official that advocated closer relations with foreign nations and the adoption of western methods and western ideas. Ever since then he has been identified with the conduct of the foreign relations of China. His frankness in conversation in his dealings with foreigners with whom he was thrown in contact made him more acceptable to the West as the representative of China than other officials, who had more of the peculiar mannerisms of their race. His death is a great loss to the liberal and progressive party in China. . . . . A circular note has been addressed by the Sultan of Turkey to his representatives abroad, announcing that the Porte has satisfied all the French demands, and expressing a hope that France will appreciate the conciliatory spirit thus displayed and resume the relations so unfortunately interrupted. . . . . Earthquake shocks continue to be felt at Erzeroum, Armenia. There have been many casualties. The foreign consuls have jointed the inhabitants and are living in tents.

FARM AND GARDEN.—Following is a list of the farmers' institutes announced by the Missouri State Board of Agriculture for three weeks, beginning November 11: Aux Vasse, November 11 and 12; Mokane, November 12 and 13; Marthasville, November 13 and 14; Ste. Genevieve, November 13 and 15; Perryville, November 15 and 16; Altenburg, November 16; Jackson, November 18 and 19; Lutesville, November 19 and 20; Yorley, November 20 and 21; East Prairie, November 21 and 22; Kennett, November 22 and 23; Piedmont, November 23; Lesterville, November 23; Ironton, November 25 and 26; Fredericktown, November 26 and 27; Farmington, November 27 and 28; Potosi, November 28 and 29; Festus, November 29 and 30.

The first snow of the season fell in Kansas November 4, but it melted quickly, and no injury to crops is expected..

The New York State Breeders' Association will hold their show at Buffalo December 17-19.

The Missouri State Swine Breeders' Association will meet at Chillicothe December 9-10; Secretary F. H. Schooler, Rockport, Mo.

The twenty-ninth annual session of the New York State Grange will be held at Olean, N. Y., February 4, 1902. Applications for accommodations should be made in advance by writing Brother F. N. Godfrey, Olean, N. Y. Arrangements have been made with the Trunk Line Association by which all attending the State Grange can secure passage and return for one and one-third fare for round trip, on the certificate plan. On purchasing ticket take a certificate from ticket agent, showing full fare has been paid to Olean for the purpose of attending State Grange. On arrival at Olean present this certificate to W. N. Giles, who will certify to your attendance, and you will then be entitled to a return ticket at one-third regular fare. Persons intending to attend State Grange should make application to the office where they intend to purchase tickets some days in advance, so that the office may have opportunity to provide itself with certificates. Tickets are positively not transferable, and the State Grange must redeem at full fare all tickets found in the hands of scalpers.

The forty-sixth annual meeting of the Illinois State Horticultural Society will be held in the Agricultural Building of the University, Champaign, Ill., December 10 to 12. The programme will be filled by men of prominence in their respective lines, in this and other States, and will include those practical and scientific subjects, which are of timely importance. The usual liberal premium list will probably bring out a fine show of fruit. The display of spraying appliances and horticultural tools which attracted so much attention last year will be a feature again this, and we are promised some of the latest and best things in this line; secretary, L. R. Bryant, Princeton, Ill. The three Illinois district societies will hold their annual meetings as follows: The Central Society, at Quincy, November 20-21; J. C. Blair, secretary; Urbana, Ill. The Southern Society, at Carbondale, November 26-27; E. G. Mendenhall, secretary, Kinmundy, Ill. The Northern Society, at Dixon, December 4-5; Jacob Friend, secretary, Nekoma, Ill.

The Wisconsin Legislature has passed a law requiring dealers in concentrated feeds to take out a license, and give analyses of all mixed feeds.

I. N. Barker, of Thorntown, Ind., died at his home November 3, aged 62. Mr. Barker was one of the best known breeders of Berkshire swine in Indiana, and was deservedly esteemed by a wide circle.

S. H. Todd, the well-known breeder (now retired) of Shropshire sheep and Chester White hogs, will give two of his lively talks before the Pennsylvania Live Stock Breeders' Association at the Monongahela House, Pittsburg, December 18 and 19. Breeders of Pennsylvania, West Virginia and eastern Ohio should not miss this opportunity to hear him. Pennsylvania breeders invite those of all neighboring States to participate in the good things at their meetings.

The annual meeting of the American Cheviot Sheep Society will be held at the Transit House, Union Stock Yards, Chicago, Ill., December 4, 1901.

SELLING MANURE AT THE STOCKYARDS.

Dumped Into River at Kansas City.

There has never been any manure sold here. The farmers could have same for the taking away. We clean pens once a week. We have 14 double carts that hold three yards that are kept in use six days in a week; they take from 20 to 25 loads each day, making from 1,500 to 1,800 yards per week, and this is dumped into the river. The farmers of this county do not seem to appreciate the value of manure, as we do not have a dozen loads per year hauled out by them. J. W. MITCHELL.

Kansas City Stock Yards.

Good Sale at Chicago.

The larger part of the manure from this yard is shipped to truck farms within a radius of 75 miles of Chicago, principally northern Illinois and southern Wisconsin, and to the fruit district in southern Michigan. The demand from these points is increasing annually. We ship between 600 and 1,000 cars a year, and charge $5 for old well-rotted manure and $3 per car for fresh manure. These price are f. o. b. Union Stock Yards, switching and freight in addition. About one-third of the manure shipped comes direct from the pens, and the remainder is loaded from the dump. A. G. LEONARD.

Union Stock Yards, Chicago.

Fair Prices at Pittsburg.

There is a large sale of manure from here, or rather a heavy demand, at a fair price. We have for sale about 200 to 300 cars annually. We get $12 per car f. o. b. on our siding at our yards. It is shipped on orders in the Pittsburg district only a few miles, probably from five to 30. We have a force of men who attend to the cleaning out of the pens and alleys regularly each week as soon as the main market day is over, and this is loaded directly on to the cars. We have an elevated platform arranged so that we can dump our carts into the car. I might state, however, that we had an order last Summer for 100 carloads, provided they could get a shipping rate, the distance being about 90 miles into West Virginia, where a man was fitting up a nice country home and stock farm. We have not heard from him lately, and suppose he did not get a rate low enough in price.

Manager Pittsburg Stock Yards. SIMON O'DONNELL.

Facts About the Florida Orange Crop

The number of boxes produced for the season of 1899-1900 was about 1,000,000; the crop now going forward and to be shipped will run at from 1,100,000 to 1,200,000 boxes. Possibly 100,000 boxes will be consumed within the State and nearby cities and towns. There will be a falling off in the output from the older bearing groves, and the increase will be made up from young trees coming into bearing, and from the rebuilt groves of the older orange district. About 50 per cent of the old groves in the central orange section have been worked and taken care of since the destructive freeze of 1895, and with no further setback these will largely add to the State's production in the next few years, as age of tree tops and bearing surface increases. About one-quarter to one-third of the present crop will be shipped from points north of a line running east and west through Tampa. Orange County produced about 25,000 boxes last season and will double the output for the present; Lake County 4,000 to 5,000 boxes in 1899-1900, and will ship 15,000 to 20,000 boxes this season. Crescent City, in Putnam County, in the northern part of the old orange section, shipped less than 100 boxes last year and will ship about 2,500 boxes this. Estimates of the Indian River crop run up to 50,000, although we think this is excessive. Throughout the State the fruit is said to be somewhat smaller in size but of better quality. Complaint has been made early in the shipping season for twenty years past that producers were marketing fruit which was immature or too green. We see no reason for thinking that this will be different in the future for several reasons: Many growers who are poor or living on credit need the money and ship when the fruit begins to turn in color; fruit in some locations either in rich hammocks or lower lands split and drop from the trees in the fall and are boxed at once to save them; early picking relieves the trees, which blossom more heavily in the Spring, and hold them, increasing the following crop; it pays the shipper, as prices rule higher early, and slowly drop as shipments later increase. The Florida orange is not at its best until the middle of December, when it is fully matured and its juices have been perfected. For the week ending November 2 50 carloads of fruit left the State, and by the middle of the month the output will be doubled to meet the demands of Thanksgiving. C. S. GOWEN.

Jacksonville, Fla.

Michigan Crop Matters

The weather has been ideal for Fall work so far, clear and warm, but too dry for Fall grain. But very little wheat was sown and that was put in late to avoid the fly. There is a large acreage of rye as prices have been good and the yield fair for a number of years back. The stand is poor on account of dry weather,. Corn is a booming crop this Fall. Mecosta County never had better; through this section the yield is from one-third to one-half above the average, and a large acreage was planted. It is nearly all husked and in the crib. Potatoes are away below the average this year, a few small pieces turning out fairly well. Prices are soaring, and the largest part of the crop is gone now. The man that buys potatoes next April will pay good money for them. Apples are something we read about here this Fall. Prime varieties will bring $1 per bushel in our home markets. There are but very few for sale. The bean crop is good. They are worth $1.65 per bushel now. They are taking the place of potatoes here, and will be raised to a greater extent in the future.

Mecosta County, Mich. W. B.

Down on Vermont Deer Laws.

I think the general opinion of all back farmers is in accord with mine; that is, that the deer law is an imposition on the farmer, and a nuisance, and we have no respect for it. We pasture the deer, and the dudes with high-topped boots and hunting jackets come in deer season and tramp over our premises. If so be that we can leave our work at that time we may share the general privilege of running the risk of getting a bullet in the head, or possibly, but not probably, a shot at or get a deer, for farmers as a rule are too busy to practice so as to be expert marksmen. We have had one-quarter acre of squashes destroyed one year, to say nothing of their tramping down oats and lying in newly seeded pieces every year. I hear of one farmer who has lost a lot of cabbages and another a garden by the deer this year. Our stock is hardly safe in hunting season, and even our pet cat came in a night or two ago dragging a leg horribly mangled, the result of a bullet after deer

Healdville, Vt. B. E. G.

Honesty Among Hay Balers

Here are two sides to the hay baling business:

The stories you hear regarding false packing of square baled hay are the sober truth, as we know from our experience, having at our Brooklyn plant broken up many hundred tons of these bales. Besides stones and sticks, we have found the hoofs and horns of oxen with an occasional dead chicken, all placed in the bales, presumably to add to the weight. PLANTERS' COMPRESS CO.

New York.

Relative to the putting of rocks, sticks and similar things in baled hay, I beg to advise you that my experience of twenty years in the hay business has led to believe that this is nearly all a matter of ridicule. I have sometimes found sticks and stones in baled hay. The horse rake picks up more or less stones and sticks, which are not seen by the loader. However, this is a matter of very small account in the amount of hay that is put up. As a general rule baled hay is put up with as much honesty of purpose as any other commodity which we buy. Baled hay is not a gamble when bought in bales, and I would much rather take my chances in looking over a lot of baled than loose hay, as it enables me to see the larger proportion of it and get more closely to the whole amount.

Towanda, Pa. E. D. RANDALL.

Woman and Home

From Day to Day.

OPTIMISM.

Just around the corner, as you travel through this life,
Is some spot that's bright with sunshine and forever free from strife.
The lane may be a long one, but its course will change some day
And lead you to the gates that keep our sorrows all at bay.
You'll find tasks not so difficult; no lessons hard to learn,
Just around the corner, if you know the way to turn.

The winds will breathe sweet music and forget their stormy way,
And the rose that died in August in your heart will smile for aye.
The babble of the high road will be left far, far behind,
And you'll greet the restful twilight with a calm, contented mind.
You will reach the land of pleasures, if the right you care to earn,
They are just around the corner, if you know the way to turn.
—Washington Star.

*

ONE of the strengthening foods often ordered for invalids or convalescents is a raw egg beaten into milk, with or without some stimulant. No form of food grows more monotonous; the patient soon feels like the man who undertakes upon a wager to eat so many quail in so many days. An occasional variation may be made by giving the raw egg in a cup of coffee. Prepare a cup of coffee in the ordinary manner, stand it in a pan of boiling water to keep it very hot, and then quickly stir in the egg, which has been previously beaten very light. It is very palatable and, if quickly stirred in, the effect of the egg is little different from rich cream.

*

A WESTERN editor gives notice to the birds that if they want to know what became of their missing friends, they can find out at any time by hovering over a crowd of women with their new Fall hats on. Unfortunately, this ugly and barbarous fashion of using birds as trimming seems more prevalent than ever, in spite of the Audubon Society. It is useless as well as barbarous, for there is such a wide range of choice in millinery that no woman need make the silly excuse that she must follow others, or look out of date. The simple fact is that she wears such trimmings because she wants to, and thereby permits her thoughtless vanity to become an agent for the destruction of innocent life.

*

A FRENCH entomologist, M. Dagin, has recently written an article recommending various insects as food material. He has the courage of his convictions, for he himself has eaten hundreds of species, raw, boiled, fried, roasted and hashed. He has even eaten spiders, but does not recommend them, and we indorse his judgment. Cockroaches, however, he considers excellent, either made into a bisque soup, or shelled and eaten like a shrimp. Personally, though it may be merely a matter of conventional prejudice, we shall continue to prefer shrimps, although, in point of personal beauty, the shrimp possesses few advantages over the genial, though obtrusive, cockroach. M. Dagin says that caterpillars are light food and easy of digestion, a view that will be corroborated by any experienced hen. The use of locusts as food is less of a novelty, as they are eaten in several parts of the world, though as a rule Europeans only take to them under stress of hunger. Thus, during the long siege of Mafeking, in South Africa, the imprisoned British used locusts as an addition to the scant monotony of their fare. The Piute and Digger Indians have a weakness for grasshoppers, but they are not generally regarded as gastronomical experts, and we do not think that M. Dagin's recommendations will be generally approved. The use of insects in medicine was very common in old times, and we have known cases in progressive New Jersey where spiders and angleworms were administered of recent years as a remedy for chills and fever.

*

STATE and Nation now make public acknowledgment of their official thankfulness for continued prosperity, and we in private life follow the same custom. It may be merely perfunctory—a matter of habit rather than feeling—but surely no one is the worse for making an effort towards personal thanksgiving: it is in season all the year round, even if we only acknowledge that fact officially on the last Thursday in November. There are few among us who cannot find one cause, at least, for thankfulness. The power to turn duty into pleasure—to extract personal happiness from the trivial round of daily life, and to give of our best ungrudgingly to others—these are the surest foundations for our own thanksgiving. A thanksgiving merely for personal security or happiness is human enough, but it is not the best; even our own well-being is often the gift of a prayer denied. Ruskin says: "To watch the corn grow, or the blossoms set; to draw hard breath over plowshare or spade; to read, to think, to love, to pray, are the things that make men happy."

3965 Girl's Coat,
6 to 12 yrs.

The Rural Patterns.

The girl's long coat may be made with or without the cape and hood. As shown, it is made of kersey cloth in tobacco brown, the hood lined with figured silk, but covert cloth, broadcloth and velvet are all correct. The cape and hood may also be made as a separate garment. The coat proper is half fitting at the back, but loose at the front and includes coat sleeves and pockets finished with overlaps. The cape is circular, fitted with single darts at the shoulders. The hood falls over the shoulders in graceful folds and finishes in double points at the back. At the neck is a collar that can be made in roll-over or military style as preferred. To cut this coat for a girl of eight years of age 4½ yards of material 27 inches wide, 2⅞ yards 44 inches wide or 2¼ yards 54 inches wide with ½ yard of silk to line hood will be required when cape and hood are used; 3½ yards 27 inches wide, 2½ yards 44 inches wide or 1¾ yard 54 inches wide when coat is made plain. The pattern 3965 is cut in sizes for girls of six, eight, ten and twelve years of age; price 10 cents.

The fancy waist shown is made of pale pink Sapho satin, with bolero and deep cuffs of cream lace over white and bands of black panne satin; but all white, white with color, or any color banded with the same shade in velvet would be effective; in addition to which the bolero and cuffs could be made of panne or Persian brocade in place of lace. The lining includes double darts, under-arm gores and side-backs, and fits snugly. On it are arranged the several portions of the waist, and the two close together at the back beneath the center box pleat. The yoke is simply banded with folds, but the lower portions of backs and front are laid in narrow box pleats that extend from its lower edge, beneath the bolero to the belt. The bolero can be made entirely separate and the waist worn with or without or caught at the upper edge and included in the arm's-eye seams. The sleeves are novel and becoming. The lower portions are covered smoothly to form cuffs that flare over the hands, while the pleats of the upper portions fall free to form puffs at the elbows. When desired low neck and with elbow sleeves the yoke and cuffs can be omitted. To cut this waist for a woman of medium size 3¼ yards of material 21 inches wide, 2⅞ yards 27 inches wide, 1¾ yard 44 inches wide or 1⅝ yard 50 inches wide with 1¼ yard of all-over lace for bolero and sleeve facings will be required. The pattern 3962 is cut in sizes for a 32, 34, 36, 38 and 40 inch bust measure; price 10 cents.

SUPPOSE you say to yourself: "This is an ordinary, shabby life of mine to look at—no great thing to do or be or hope for or grow to. I have just got to content myself with drudgeries that must be every day the same and never advance me beyond themselves. But I mean to put great cheer into all I do; I mean everything shall show integrity, shall speak of honesty, shall prove my truth; nothing that I touch that I will not adorn by some grace of soul." What will be the result? Where will be the paltriness, the worthlessness, of your life?—J. F. W. Ware.

3962 Fancy Waist
32 to 40 Bust.

TRY GRAIN-O! TRY GRAIN-O!

Ask your Grocer to-day to show you a package of GRAIN-O, the new food drink that takes the place of coffee. The children may drink it without injury as well as the adult. All who try it, like it. GRAIN-O has that rich seal brown of Mocha or Java, but it is made from pure grains, and the most delicate stomach receives it without distress. ¼ the price of coffee 15c. and 25c per package. Sold by all grocers

Earning Christmas Presents

Between now and Christmas you can earn enough money to make all your family and friends handsome Christmas presents.

10 Weeks for 10 Cents.

You have several neighbors and friends who need THE R. N.-Y. We are going to help you to see that they get acquainted with it. For our part we will send the paper to them now 10 weeks for 10 cents—a cent a week. We ask you to call their attention to this offer. Perhaps you can get up a club. The 23 largest clubs will each get a cash premium January 1. Will you be one of them?

Mrs. Marchant's Best Thanksgiving.

"She ain't no kind of a neighbor, Mis' Marchant ain't, not for going round amongst us here. At first along we used to go and see her and return our own calls, but after a while we got sick of that, and now we leave her mostly alone. But for all she's so unsociable, she's the very first person anyone thinks of when there's sickness, and I never knew her to refuse to come at such a time. Mr. Marchant, he's one of these easy-goin', handy men, and he gets along and looks after their two orphan grandchildren when she goes away nursing. She is a dreadful good nurse, and I don't know what we should have done without her while Janet has been so sick with pneumonia."

Mrs. Pryor was talking to her sister, who had just come to help her.

"Is she here now?"

"Yes, but she's just going home. Janet is so much better that we thought we could let her go. Here she is now."

A door opened and Mrs. Marchant came in. She was a quiet little woman, with a gentle voice, and a face whose placid expression changed often to one of anxiety.

Mrs. Pryor introduced her sister. "I'm real glad she's come," she said, helping Mrs. Marchant on with her things, "for now you won't have to worry about us a bit. And I know you must want to be at home to do up your work and get ready for Thanksgiving. I s'pose you expect all your folks home?"

"Yes, they're all coming. I suppose I'm wicked, but somehow I always dread Thanksgiving. There is so much to do, and especially with only my one pair of hands to do it. And this year I dread it more than common, for you know Richard is going to bring his new wife that I've never seen, so I'm more than ever anxious about having things nice."

"It is a lot of work," said Mrs. Pryor sympathetically, "but I suppose Frank's and Will's wives take hold and help."

"Oh, yes, to be sure. I've got good daughters-in-law, extra good, and I don't expect my new one will be any exception, but it seems a little strange at first."

Although she was so loyal to her sons' wives, Mrs. Marchant in her secret heart admitted that they were not quite so efficient as she could wish, and as she walked home from Mrs. Pryor's she sighed a little at the work before her. She was not a violently energetic housekeeper, but she prided herself on having faculty and being able to do a great deal of work by keeping steadily at it. Her home and her family occupied all her thoughts and time, and from year's end to year's end she hardly so much as had a book or paper in her hand, unless it was to dust the former or put away the latter. When she got home she set to work at once on her house-cleaning. That was to be done first, then she would give her attention to the preparing of the Thanksgiving feast.

"It's lucky that Janet Pryor decided to get better just when she did," said Mr. Marchant that evening.

"Why so?"

"I've got to go to the city Friday to attend to the settling of Father's property and some other affairs, and I may have to stay a week or two. Can't you get somebody to stay with you while I'm gone?" His eyes twinkled, for he knew what her answer would be.

"I don't want anybody to stay here. I'd be ashamed if I couldn't stay alone. I can see to the hens, and Johnny is old enough to milk the cow. The harvesting is all done, and you can go as well as not. It couldn't have happened at a better time."

Friday came, and after Mr. Marchant had started for the city, his wife went to work at the cleaning. Of course she missed him, but there would be one less in the family to do for, and she would have more time to work. Johnny and Mary were no trouble, and they were at school most of the time, too. She would get along nicely. Mr. Marchant had told her as he went away, that he would be home by Thanksgiving Day sure, but that he should probably come before that.

Saturday the children were at home. It was a cold stormy day, and they played out more than was good for them, with the result that Sunday they were almost sick with croupy colds. Mrs. Marchant dosed them and kept them in the house, but they were so far from well on Monday that she decided to keep them home from school for a week. They improved as fast as could be expected, and by Wednesday she let them play out of doors a little while. The next day they begged so hard to go out that, although it was cold, she bundled them up and let them go, telling them to stay in the sun as much as possible.

"Now," she said, when they were gone, "I will finish the cleaning, and then I can plan what to do about the dinner next week. It is fortunate Thanksgiving comes late this year. I never could have got through if it hadn't, what with taking care of Janet and the children being sick."

She had washed the last door in the kitchen, but there was one more thing to do. In the ceiling overhead in the kitchen was a kind of step, so that one side was lower than the other. Where the step came was a long board, going the whole way across the kitchen. She always left this board till last, but she was very particular to wash it carefully, as it got rather smoky from one housecleaning to the next. She rolled the kitchen table into position, and climbing upon it, began to scrub the board. It was very warm in the upper part of the room, so she climbed down and opened the door into the dining room. It was cold in there, as she had not built a fire except in the kitchen since Sunday.

"Now I must be very careful," she said, as she climbed back to her place on the table. "It would be terrible if I should fall and be laid up. What would I do?"

She worked on and had got the board half cleaned. "I wonder if I feed that turkey enough," she was thinking. "I don't want it to be too fat, but just right. I must send Johnny to Mr. Gill's this afternoon to get some meat for mince pies. I can make the mincemeat this week. It is better for standing a little after it is made. Then I think I will make cranberry jelly this time. It is richer than sauce. I wonder if Dick's wife is one of the fussy kind. I must see if I can't get Mary and Johnny to help me some. They are old enough, and perhaps I can get things to going so that when the folks come I won't have to hurry so."

Just then she paused. She seemed to hear something at the back door. Yes, some one was coming in. She stood still in the center of the table and waited. Perhaps it was the children.

The door flew open and in came Mr. Marchant and his three sons and their three wives.

How Mrs. Marchant got down off the table she never knew, but in a moment she was being hugged and kissed and Richard had presented his wife.

Mrs. Marchant was in a flutter. She laughed nervously. "This is quite a surprise," she said. "I didn't look for you till Thanksgiving Day."

"Why, *this* is Thanksgiving Day," the answer came in chorus.

She looked wildly from one face to another, then towards the calendar on the wall.

"Oh, dear!" she wailed. "How could I have made such a mistake. I thought it was the last day of the month, but I see now that the last day is Wednesday instead of Thursday. Oh, how could I have done it! I was just finishing cleaning—she glanced at the ceiling—"and there isn't a thing cooked in the house, and it's as cold as a barn here."

For a moment there was dead silence. There was a look of agonized despair on Mrs. Marchant's face. Mr. Marchant was plainly filled with consternation. The sons were surprised and embarrassed, and Frank's and Will's wives looked on helplessly.

Then Dick's new wife stepped forward and put her arms about poor Mrs. Marchant. "Never mind, Mother," she whispered softly. "It will be all right."

No one could tell how she did it, but in two minutes Dick had his coat off, his shirt-sleeves rolled up, and standing on a chair was finishing the scrubbing of the board his mother had abandoned. Mr. Marchant was stuffing wood in the kitchen stove, Will was rushing out to the shed for kindlings, and Frank was crumpling up an old newspaper and putting it in the dining-room stove.

A moment more and all the women folks had disappeared, but by the time Dick had emptied the pail of water and hung up the cleaning cloth, and as the fire began to send out a welcome heat, they all came back, the three daughters-in-law dressed in calico wrappers—some of them misfits, it must be confessed—and Mrs. Marchant with a tremulous smile on her face and a sparkle in her eyes. Then in response to a look and a word from his wife, Dick brought out the best rocking-chair for his mother, and she was made to sit in it.

"Your part is just to tell us where things are, and how to do things," she was told.

The two daughters who had been considered inefficient proved quite the contrary, and Mrs. Marchant looked on in amazement. Mr. Marchant went on a murderous errand to the chicken yard. The sons were sent to the cellar and were pressed into the service in paring vegetables, but after a time Dick's wife, who was the recognized leader, told them that they could help most by taking themselves and the children out of the way. "Can't you get some evergreens and holly or something for a center-piece?" she asked, and they took the hint and went racing away like young boys towards the woods. At exactly two o'clock there was a long blast blown on the dinner horn, and the men folks, who had been wandering over the farm, came in to find the dinner ready and the misfit calico wrappers replaced by the owners' well-fitting gowns, said owners with unusual color in their cheeks.

That was a marvelous dinner. To be sure, some of the regulation dishes were absent, notably the turkey, but there was a perfect chicken pie, delicious croquettes, all sorts of vegetables, a wonderful apple pudding, sparkling currant jelly, with coffee and cookies for the finale.

"Well," said Mr. Marchant with a satisfied sigh at the end of the feast, "that's the best Thanksgiving dinner I ever ate that was got up in so short a time with nothing to start with but bread, cold corned beef and a jar of cookies."

"I can say more than that," said his wife, beaming on the faces around the table. "It's the best Thanksgiving dinner I ever ate in all my life, and what's more, this is the happiest Thanksgiving Day I ever spent," and for a moment her glance rested gratefully on the face of Dick's wife. SUSAN BROWN ROBBINS.

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

A Christmas Gift From LESLIE'S MONTHLY

Art added to good literature makes this Christmas offer interesting to everyone who reads and has a nook wherein to hang a picture. Everyone subscribing **One Dollar** now will receive **Leslie's Monthly for 1902; the Double 25th Anniversary Number,** superbly illustrated; and the **Beautiful Christmas Souvenir Issue.** These fourteen numbers of **Leslie's Monthly** will contain **over 1500 pages** of the brightest and best reading, **over 900 illustrations, over 100 short stories,** many beautiful color plates, covers in colors, a different design each month. If you mention *The Rural New-Yorker,* we will send, charges prepaid, this remarkable combination of literature and art together with the

Elegant 1902 Art Calendar

portraying "*Popular American Actresses and Their Favorite Flower,*" **all for $1.00.** This calendar is a fine example of American art painted especially for **Leslie's Monthly** by Miss Maud Stumm, the famous American water color artist. Art stores would charge 50 cents each for these calendars. They are 12¾ x 10 inches, tied with silk ribbon, lithographed in twelve colors on heavy pebble plate paper.

The Anniversary Issue and Christmas Issue of **Leslie's Monthly** are worthy of preservation as examples of the highest point attained in artistic magazine illustration in colors and black and white.

Among the fiction and bright special articles which will appear in **Leslie's Monthly** during 1902 are products of the pens of Nansen, Zangwill, Ballington Booth, Henry van Dyke, Owen Wister, C. G. D. Roberts, Ralph Connor, Booker T. Washington, Frank R. Stockton, Mary Wilkins, Margaret Sangster, Conan Doyle, Sienkiewicz, F. Hopkinson Smith, Ian MacLaren, Hamlin Garland, Quiller-Couch, Bret Harte and a multitude of others.

By subscribing $1.00 now you receive the Art Calendar and 14 numbers of Leslie's Monthly.

Specimen copy and illustrated Prospectus 10 cents, which amount will apply on your subscription sent to us, should you accept the above offer.

To January 1, 1903, for $1. New subscribers to THE R. N.-Y. will now get the paper from the time subscriptions are received until January 1, 1903. If you will send us a club of four subscriptions, new or renewal, with $4, we will advance your own subscription one year free.

BUSINESS BITS.

THE Orangeville Agr'l Works, Orangeville, Pa., this week for the first time asks the patronage of R. N.-Y. subscribers, for Daisy cutter and crusher, horse powers, thrashers, etc. This is a well-established house, and every machine is guaranteed to give satisfaction. Their special offer for November will interest you.

One of the greatest labor-saving implements for cutting ice is the double-row plow made by John Dorsch & Sons, 226 Wells Street, Milwaukee, Wis. This plow cuts any depth, cuts any size cake of ice, and it cuts the ice quick and easy. The manufacturers issue a 36-page catalogue which will be sent free on request.

A $3,000 Stock Book is offered absolutely free to readers of THE R. N.-Y. by the International Food Co., Minneapolis, Minn. This book is a valuable one for stock feeders—it contains 183 large colored engravings. All you have to do to get the book is to answer the three questions asked in the advertisement on another page of this issue.

THE A. B. Farquhar Co., of York, Pa., has been awarded gold and silver medals for machinery at the Pan-American Exposition. This company is perhaps the largest establishment in the country devoted to the manufacture of farming implements, including drills, sawmills, separators, traction engines, boilers, cultivators, corn sheilers and the like. This A. B. Farquhar Co. is well known to the farmers of this country, where numerous products of the celebrated York manufactory are used with great satisfaction.

PRUNE VINEGAR.—Tests at the Oregon Experiment Station show that a very fair quality of vinegar can be made from the prunes which are not fit for curing and have been allowed to go to waste in the past. From half a ton of these damaged prunes 600 gallons of juice were extracted. This was fermented in large vats and then barreled. It is stated that a bushel of prunes will make three gallons of merchantable vinegar.

VERMONT APPLES.—The Vermont Experiment Station claims that the following apples originated in Vermont at the stated places:

Balm.
Bethel—Bethel.
Blakely—Pawlet.
Burlington—Burlington.
Bunnough Greening—Vergennes.
Curtis Sweet—St. Albans.
Espy.
Fall Spitzenburg.
Fay Russet—Bennington.
Highlander—Sudbury.
Ketchum's Favorite—Sudbury.
Meach—Brandon.
Northern Sweet—St. George.
Platt's Sweet—Bennington.
Pownal Spitzenburg.
Robinson Sweet.
Rum—Pawlet.
Sable Sweet.
Seedless.
Scott Winter—Newport.
Tinmouth—Tinmouth.
Wood's Sweet—Sudbury.
Wright—Hubbardton.

It doesn't make so much difference where apples or men start from—it's where they bring up that counts.

CATARRH CAN BE CURED.

Catarrh is a kindred ailment of consumption long considered incurable; and yet there is one remedy that will positively cure catarrh in any of its stages. For many years this remedy was used by the late Dr. Stevens, a widely noted authority on all diseases of the throat and lungs. Having tested its wonderful curative powers in thousands of cases, and desiring to relieve human suffering, I will send free of charge to all sufferers from Catarrh, Asthma, Consumption & nervous diseases, this recipe, in German, French or English, with full directions for preparing and using. Sent by mail by addressing, with stamp, naming this paper W. A. Noyes, 847 Powers Block, Rochester, N. Y.

Wants, For Sale or Exchange

WANTED—Farmers and Dairymen, $30 to $50, with house or board. Only competent men with good references. The Rural Agency, Durham, N. H.

170 ACRES FOR SALE in Maryland.—Convenient to Baltimore and Philadelphia markets. Excellent location and improvements. MADISON MARINE, Law Building, Baltimore, Md

WANTED—Energetic, practical farmer; prefer one with sons or assistants to operate my farm at Weston, N. J. Applicant must understand cattle, pigs and poultry. To the proper person I will give a desirable situation—complete charge of a very extensive property. Nice home. What I am after is a plain, practical farmer.
C. E. W., Room 40, 130 Broadway, New York.

"I OWN MY HOME."
That's what puts nerve and backbone into a man. We sell them on the easiest terms. More than a hundred to choose from in our Illustrated Real Estate Catalogue Mailed free Write to-day.
W. P. Allen Land & Imp. Co., Salisbury, Md.

GLENN RANCH,

Glenn County, California,

FOR SALE IN SUBDIVISIONS.

This famous and well-known farm, the home of the late Dr. Glenn, "the wheat king," has been surveyed and subdivided. It is offered for sale in any sized government subdivision at remarkably low prices, and in no case, it is believed, exceeding what it is assessed for County and State taxation purposes.

This great ranch of 40,000 acres runs up and down the western bank of the Sacramento River for 15 miles. It is located in a region that has never lacked an ample rainfall, and no irrigation is required.

The river is navigable at all seasons of the year, and freight and trading boats make regular trips.

The closest personal inspection of the land by proposed purchasers is invited. Parties desiring to look at the land should go to Chico, California.

For further particulars and for maps, showing the subdivisions and prices per acre, address personally or by letter,

F. C. LUSK,

Agent of N. D. Rideout, Administrator of the Estate of H. J. Glenn, of Chico, Butte County, California.

Barns of Plank save Timber and cash. Best, cheapest, strongest; 4,000 in use. Book for stamp. SHAWVIER BROS., Bellefontaine, Ohio.

WROUGHT IRON PIPE

Good condition, used short time only; new threads and couplings; for Steam, Gas or Water; sizes from ⅛ to 12 inch diameter. Our price per foot on ¾ inch is 3c; on 1 inch 3½c. Write for free catalogue No. 57

CHICAGO HOUSE WRECKING CO.,
W. 35th and Iron Sts., CHICAGO.

Oldest Commission House in New York. Established 1838. Butter, cheese, eggs, pork, poultry, dressed calves, game, &c E. B. WOODWARD, 302 Greenwich Street, New York

POULTRY SHIPPERS.

We make a specialty during the Winter months of handling Poultry, having a very extensive trade. Write us for any information you may wish regarding dressing, packing, etc., and we will be pleased to answer all inquiries.
Returns made on sale of each shipment.
ARCHDEACON & CO., 100 Murray Street, New York

POULTRY PORK AND DRESSED CALVES.

All conditions seem to predict high prices for Poultry, Pork and Calves, for corn is scarce. Pork will kill light. Poultry crop is light, and the times being so very prosperous, labor well employed, altogether should produce most satisfactory results.
S. H. & E. H. FROST, Produce Commission Merchants, 319 Washington St., cor. Jay, N. Y. City. Members of the Nat'l League of Com. Merchants of the U. S.

Can You

do a little pleasant and profitable work for us in your own town? No experience necessary. We will explain just what you have to do. The work will be light, and we will arrange for the time you shall be able to give to it. We can give you work for all your time or just for your spare time. Write for full particulars. THE RURAL NEW-YORKER, NEW YORK

Do You Wear Rings?

No. 77.

No. 81.

Perhaps you would like one to use as a holiday remembrance to some friend. We have been able to make arrangements with a manufacturing jeweler by which we can furnish handsome rings with stone settings at surprisingly low prices. These rings are rolled gold, with a five-year guarantee. We offer four styles. No. 77 is a single stone. You can have any color stone or any size ring. Price, 25 cents. No. 81 has three stones, Tiffany shape; you can have any combination of colors, and any size ring. Price, 40 cents. No. 79 is a three-stone baby and misses' ring, any combination of colors, and any size. Price, 25 cents. No. 66 is a cluster of imitation diamonds with center stone, which may be had in any color. Price, 75 cents. No. 55 is an Egeria diamond scarf pin. This is a gold-plated pin on German silver, which gives a high finish. The setting is new and gives a pretty effect. Price, 25 cents. We will send any one of these rings or the pin as a reward for one new subscription at $1, except No. 66. We will send this for a club of two new subscriptions, or with one new and 25 cents extra. Select ruby, sapphire, emerald, opal, turquoise or diamond. Measure size of finger carefully with narrow slip of paper, and send this with order. The rings are sold only to subscribers or their families.

No. 66.

No. 79.

No. 55.

THE RURAL NEW-YORKER, NEW YORK.

10 Weeks for 10 Cents.

We are getting a great many of those 10-weeks' subscribers; but there are thousands yet to hear from. Small lists are coming in very well, but there seems to be no one working for the cash premiums. We wish to remind those who have a little spare time that these premiums are in addition to all commissions. The premiums will be awarded January 1, 1902, for the largest 23 clubs of 10-week new subscriptions, and a new yearly subscription will count as .0 for 10 weeks each. Here are the premiums:

For the First Largest Club,	$25 00
For the Second Largest Club, -	15.00
For the Third Largest Club, - -	10.00
For the next 10 Largest Clubs, $5 each,	50.00
For the next 5 Largest Clubs, $3 each,	15.00
For the next 5 Largest Clubs, $2 each,	10.00

December is the best month in the year for taking subscriptions. Write us for a bundle of sample copies, and work up a club in your neighborhood. If you get a subscription from a neighbor who is not satisfied, we will return the whole of his money.

THE RURAL NEW-YORKER.

BOOK BULLETIN

FOR SALE BY THE RURAL NEW-YORKER.

THE INSECT BOOK, by Dr. L. O. Howard. This is a popular account of the bees, wasps, ants, grasshoppers, flies, and other North American insects, exclusive of butterflies, moths and beetles. It is especially adapted for the use of nature students. Typical life histories are given of the insects discussed; their habits and transformations are a revelation to most of us, who are likely to class all insects other than wasps and butterflies under the comprehensive title of "bugs." We are accustomed to look upon the bee as a standard model of industry, yet, as one writer recently remarked, the bee "knocks off" work on very trifling provocation, while the Insect Book describes one solitary wasp which was observed to toil continuously for 42 hours, from three in the afternoon on July 27, through that night and the day and night following until nine o'clock on the morning of the 29th. The female Ammophilia wasps differ in personal character, too, some being neat and painstaking, sweeping every particle of dust from their burrows, while others are decidedly slatternly in their habits. Many strange facts concerning the customs of the insect world are described in the book under discussion in a popular and instructive manner. Price $3; 300 pages, numerous beautiful illustrations.

MARKET NOTES

OREGON GRAIN SHIPMENTS for the week ending November 6 exceeded all previous records for the season, reaching a total of nearly 1,200,000 bushels, of which four-fifths were wheat and the remainder barley. One vessel for Hongkong carried 49,000 barrels of flour.

EXPORTS.—The Mexican Government has temporarily removed the duty on wheat. Dealers in the United States are taking advantage of this, and it is expected that 5,000 cars of wheat will be shipped over the border within the next few weeks. At a number of important border points the side tracks were blocked for several days before the new law went into effect, with cars to be rushed in, and thus take advantage of the new market as quickly as possible.

GAME NOTES.—With the opening of the game season the country in the vicinity of New York appeared all at once to be alive with hunters, and it looked as though the rabbits and birds that escaped the shower of shot might be scared to death by the fearful racket. Receipts of game for sale in this city are light, on account of the stringent laws which forbid shipments out of many States. I have noticed but few specimens of bear and deer. The State game protector is making it lively for violators of the law who have been snaring partridges on Long Island.

FARM LABOR MARKET.—The following from the letter of a Niagara County (N. Y.) reader states a problem that many people are facing at present: "Where can we get good farm help? We have 86 acres, 60 in fruit; a new tenant house with everything complete; and are willing to pay good wages by the year. Man's wife can earn in our house $50 per year at extra work. Where can we get a bright young German immigrant and wife, one who can be taught the care of orchards, etc.? Throughout this county many people want help. Tenant houses are empty, and a number of families could readily find homes here at good pay for their labor. Can't you assist us in getting help for 1902? The position will be permanent to the right parties."

At first thought it would seem that there should be no trouble in filling a place under conditions such as those named above. The difficulty in most cases seems to be that those who can do the work have some bad habit or are not trustworthy, and those who can be trusted either can't or won't learn how to handle work like the care of orchards, where the profits depend upon all details being attended to properly. W. H. Meara, Superintendent of the Labor Bureau, Barge Office, Battery Park, New York, says that by having a few week's notice he can often get desirable help for such positions. The best plan is to write him, giving full particulars as to what is needed, the conditions, and amount that will be paid. The letter will be kept on hand and referred to as immigrants come in. Italians have been employed satisfactorily on a few large farms, where a gang of them could be hired to work under an overseer. But few of the rank and file of Italian immigrants can speak English, so they would scarcely be suitable for general farm help, and they usually prefer working in gangs with their own people. Several of the extensive wholesale fruit dealers in New York are Italians, and very prosperous business men. One of them, on being asked whether an Italian country laborer could probably take hold of farm work readily as carried on in this country, said that he thought many of them could after learning the language to some extent. He appeared rather averse to saying much about it, and put on a scornful look when speaking of the immigrants. Evidently he, like many others who have struck prosperity, had learned the art of despising his poor relations.

W. W. H.

Chrysanthemum Show of the American Institute.

The annual Chrysanthemum show of the American Institute was held in the Berkeley Lyceum Building, New York, November 13-14. The entries were numerous, and the limited space too much crowded. It may be said that everything exhibited was above average quality, and many specimens really remarkable for size and finish. Nothing better than Timothy Eaton, the successful novelty of last year, was brought forward. It is truly a magnificent variety, the creamy white blooms shown being nearly 10 inches across and 7 or 8 deep. In foliage, stem and general finish it leads all the large-flowering Chrysanthemums. The blooms exhibited were much better than last season, the bright sunlight of the last six weeks having a very favorable effect on their development. The finest flowers were of well-known standard varieties, such as are offered in every catalogue of Chrysanthemum plants, and it is useless to recapitulate their names. There was a creditable collection of hardy garden varieties, which have reached great perfection this season. Good roses, violets and carnations were to be expected, and some fine groups were shown. The new forcing rose, Mrs. Oliver Ames, is very taking. While not large, the form is perfect and the coloring a pleasing blend of blush and ivory white. The fragrance is better than with most roses of its class. A vase of the new Barberton daisy, Gerbera Jamesoni, attracted great attention. The large size and novel color of vermilion daisies are not the only striking characteristics. The form is very graceful, the petals and disk being arranged in a vase form, and the stems long and stiff, with good foliage. It will soon become a favorite plant with those who learn how to grow it. A specimen of Solanum pyracantha was quite remarkable for the waxy brilliance of its large scarlet tomato-like fruits. The display of orchids and foliage plants was limited, but of excellent quality; some have not been exceeded in late exhibitions. There was a fair variety of vegetables and fruits. A collection of 21 varieties of apples from Vermont was most creditable, the fruits being of fine finish and brilliant in coloring.

W. V. F.

Cow Peas in Kentucky.

About April 10 I drilled in with a disk wheat drill six acres of Whippoorwill cow peas. In spite of the dry season a fair crop matured, and was mowed August 1. I picked enough dry peas to drill in one acre first of August. This second crop now (November 2) has peas fully matured, but not dry; just right to mow for hay—but too late in the season to cure. After frost kills the vines I shall plow the entire second crop under for a fertilizer. My invariable and fairly satisfactory practice is to sow thickly cow peas on the land I expect to plant in early potatoes. After the vines and peas are matured and dry I plow all under in Autumn. The result is excellent for ensuing potato crop, the tubers being bright and smooth; vines free from blight, and tubers with no sign of scab. I have grown Carman No. 1 on apparently poor red land by this system of which best specimens would weigh one pound, and I could make "pens" of them as (children do of corncobs). All stock have eaten peavines and peas with more avidity than any forage of which I know except peanut hay.

Hickman, Ky. D. W. R.

WITCH-HAZEL EXTRACT.—Last year we had some discussion about the value of witch hazel as a farm crop. T. S. Gold tells Meehan's Monthly something about the industry: "Agriculturally, the plant has no value, as it hardly grows large enough for fuel, but makes a bushy clump full of branches. It is found abundantly in bush pastures, and the only good thing to be said about it is that it acts as a nurse plant for better forest growth, to which it gives way. Medicinally, it has a great reputation. Pond's extract of witch hazel is manufactured by thousands of gallons in Middlesex County, Conn., as a remedy for wounds, bruises, etc. It is sold by the bottle and the barrel, and is in wide demand. Witch hazel brush—the whole plant, body and branches—is cut up short in a huge straw-cutter, and a fluid extract is prepared. The farmers get just enough for cutting and delivering the brush to pay for the labor, thus getting pay for clean pastures within the reach would like to share with Middlesex of the factories. Other parts of the State County, in this market for an otherwise useless product."

LYE AND RATS.—Poultry Monthly publishes this plan for getting rid of rats: "A most ingenious plan for driving away rats was worked recently by a friend who lives in the northern part of New Jersey. He had tried everything, including poison. The latter did kill a few rats—and a good many chickens. Some one told him to get some concentrated lye of the greatest possible strength, and mix it with butter. He did this and used the mixture with the result that, for several nights at intervals the rats about the place rent the air with their screams. But the rodents disappeared. When next signs indicated that some had returned, more of the mixture was used, with the pleasing result that they again became notable by their absence. The method of treatment was as follows: Every rat hole that could be found was smeared to the depth of about six inches with the mixture. Near at hand was placed a pan of water in which a few drops of capsicum (red pepper extract) had been dissolved. When the rodent made up his mind to emerge from his hole, inquisitiveness and the odor of the butter in the mixture impelled him to poke his nose into it. One poke was always enough, and Mr. Rat would dash out of that hole 'on the fly.' The water promised relief, and into it he would promptly jam his snout. More excruciating torture, and the rat would promptly shake the dust of those premises from his feet, even though he was unable to keep the mixture, over which he had walked, from fairly scorching those same feet."

House Work

Seems easy to a man, but there is a great deal of lifting and reaching to do; a great many trips up and down stairs to make in the course of day's house work. It's hard where a woman is well. For a woman suffering with some form of "female trouble" it is daily torment. There are thousands of such women struggling along, day by day, in increasing misery. There are other thousands who have found a complete cure of their disease in the use of Dr. Pierce's Favorite Prescription. It stops debilitating drains, cures irregularity, heals inflammation and ulceration, nourishes the nerves, and gives vitality and vigor. It makes weak women strong and sick women well. It contains no opium, cocaine nor other narcotic.

"For a number of months I suffered with female trouble," writes Miss Agnes McGowne, of 1212 Bank St., Washington, D. C. "I tried various remedies, but none seemed to do me any permanent good. The doctors said it was the worst case of internal trouble they ever had. I decided to write to you for help. I received a very encouraging reply, and commenced treatment at once. I had not used your 'Favorite Prescription' a week before I began to feel better, and, as I continued, my health gradually improved. It is improving every day."

Dr. Pierce's Common Sense Medical Adviser is sent *free* on receipt of stamps to pay cost of mailing *only*. Send 21 one-cent stamps for a book in paper covers, or 31 stamps in cloth, to Dr. R. V. Pierce, Buffalo, N. Y.

Consumption, Bronchitis and Bronchial Asthma.

Diseases Which Cause Almost as Many Deaths as Consumption.

From Dr. Robert Hunter's Lectures on Consumption.

A cold settling on the chest or grippe that goes down to the lungs produces bronchitis, and when it has continued for several months it becomes chronic bronchitis.

There is at first only trifling cough in the morning with slight chilly feelings, followed by a sense of feverishness towards evening. Walking rapidly or going upstairs cause shortness of breath with a general sense of tightness and oppression in the chest.

As the disease advances the patient begins to raise yellow or greenish-yellow matter; has hectic fever and night sweats and loses in flesh and strength. From this point, unless arrested by treatment, it goes on rapidly, soon exhausts the vitality and causes death with symptoms closely resembling consumption and yet not consumption at all.

By careful observation extending through many years, I am confident that fully TWO-FIFTHS of all the deaths charged to consumption are really deaths by consumptive bronchitis. On examining the sputum and the tissue of the lungs in these cases we find neither tubercle nor the bacilli germs that are always present in TRUE consumption.

This is a most important fact, for bronchitis is much easier to cure than consumption, every case being curable if properly treated. It is only a seated, chronic inflammation of the mucous lining of the air tubes, and at the worst is as certainly curable in the lungs as such inflammation in any other part of the body.

Consumptive bronchitis is not curable by medicine given in the stomach, nor by those hyperdermically injected, for they never reach its seat. It is only by the direct application of medicines to the lining of the bronchial tubes in the lungs that cure is ever effected. The disease is not in the stomach, nor in the blood, but in the lining of the lungs, and THERE THE REMEDIES MUST BE APPLIED.

Nothing but a direct application of healing medicines, antiseptics and germicides to the very seat of the disease will affect the cure of this or any other lung case, and they can be applied only by inhaling them in a gaseous state. The lungs constitute an air cavity, and can be reached medicinally only by medicated air. This treatment was discovered, perfected and first successfully applied by me. It is the only natural, scientific and common-sense treatment ever applied for the cure of bronchial and consumptive diseases. If it fails, nothing else could possibly succeed. But it never does fail, unless mortal injury to the lung structures has taken place before it is applied.

Readers mentioning THE RURAL NEW-YORKER can obtain Dr. Hunter's book, "The Lungs and Their Diseases," absolutely FREE by addressing Dr. Robert Hunter Association, 117 W. 45th Street, New York City.

FARM AND DAIRY NOTES.

Building the Dairy Barn.

A Business Subject.—Probably never in the history of dairying has there been so much interest in barn and stable construction as at the present time. Dairying has developed into a science, and a business of splendid proportions. The barn and stable are to the dairyman what the office is to the merchant and trader; a place of business, where his best efforts should be put forth. Did you ever see a successful and satisfied dairyman who had cold, dark, damp cow stables, who spends as little time as may be consistent with pushing in the feed and pitching out the manure? Such a man needs to repair his office, that is, if he is able to do so. After all, did you ever see a man with an ideal constantly before him who did not sooner or later reach it, or approximately so? A dairy farmer with a daily determination to have a warm, light and well-ventilated stable, gets it. We always subordinate every desire for our ideal.

The Fundamental Needs.—Great expense and elaborate construction are unnecessary, unless the means are at hand to accomplish the desired end. There are three fundamentals, however, not to be forgotten, that will insure success; light, which means sunshine directly upon the animals; warmth, above 50 degrees, and I am not sure but we may say 60 degrees, and last but not least, ventilation. Let us first look at the importance of light. Just why barn builders are so indifferent to glass surface in the stables I am unable to say. I might cite any number of cases, in fact, they are legion, where one small window furnishes light for 20 animals. I was passing a barn just completed, recently, size 30 x 60; two windows 2 x 3 feet furnish light, and both of them are nearly covered with slats, to prevent breakage of glass. Wisconsin barns are quite largely built with a hood or projection over the stable. That is, the superstructure above the stable is eight to 10 feet wider than the stable, forming a shed, which, of course, shuts out every ray of sunlight, without regard to glass surface. In order to secure free admission of direct rays of the sun, the points of the compass must be taken into consideration. A combined southern and western exposure provides a constant admission during the day when not cloudy. One does not need a studied knowledge of bacteriology to know the value of sunlight as a germicide. Several years ago I attended a session of the Chemung Co., N. Y., Medical Society, at which time Dr. Cooper Curtice delivered a very elaborate address upon tuberculosis, aiming to prove the danger to man from a free use of mixed milk, citing the condition of a herd which he had recently slaughtered. Members of the Association complimented the doctor upon his address, including one elderly M.D., who from his general make-up seemed to be a man of good judgment and sense perhaps, rather than one of long college training.

He said, in substance, that he had been much interested in the discussion; he had in mind, however, an instance in his practice which might serve to express his opinion of a cause of the dread disease and the danger from milk as a food. A family in his charge had been paying him annually over $100 for service on account of throat and lung trouble, including at one time a case of tuberculosis. He had finally advised them to cut down some of the shade trees around their house, trim up others, open up the shutters and let in God's sunlight, even though it did fade the bright colors in the carpet. Result, a yearly bill of less than $20; and the family continued to use milk just the same. Pretty good advice to home-keepers as well as cow-keepers.

The Tuberculosis Question.—I am not sufficiently learned to enter into a discussion of the relation of bovine to human tuberculosis; even if I could, it would be out of place here. I firmly believe that sanitation is the basis for healthy animals, and not a free use of tuberculin, and that more rapid advancement in animal health will be secured if our State authorities will use strenuous efforts to bring about improved sanitary surroundings rather than in slaughtering suspected animals. This is a pertinent subject in discussing barn construction. It is becoming a well-established principle in Government control of infectious and contagious disease that sanitation is far more effective than quarantine. We have been maintaining strict quarantine against Cuba for years, and as all know only moderately effective. As soon as Gen. Wood began his campaign against ages of Spanish filth accumulation we began to feel the effect of removing a cause. It is simply putting into practice the old adage that an ounce of prevention is better than a pound of cure. It is from this standpoint I reason that effective and permanent work along these lines can only be done by constantly agitating the necessity for light, warmth, and a dry pure air, as a foundation for health. Have you ever applied to your animals the feeling you have in the late Fall or early Winter days when complete saturation has taken place, and low temperatures are at hand? The shivering, disagreeable teeth chattering takes place that precedes a "cold," and you hasten to put on woolen. Your wife says: "What will you do in midwinter if you are cold now?" and sure enough the thermometer registers above freezing, and still you know that a zero day in January with a dry atmosphere will be as comfortable. What has this to do with stable construction? It has much by way of convincing proof, if such is possible, that cows need a dry air. They are not provided with extra woolens for immediate use, and are therefore obliged to sacrifice milk, flesh or vitality. H. E. COOK.

COWS AND THEIR CARE.

Fresh Cows.—Conditions have changed during the last 12 or 15 years. The time was when February and March were the best months in the year for selling butter. There was a scarcity at that season, and it paid to have plenty of fresh cows. Now prices begin to fall in January, and continue to go down for several months. For that reason it is doubtful whether cows that freshen after the first of December and before the first of March or April are as profitable as those that come fresh the last of August or early in September, or even in April and May. September, October and November are months when milk is bringing a good price, and can be produced at a very moderate cost. From April on prices are not so high as in the Fall, but the cost of keeping a cow for a year, if she freshens in April or May is less than when she freshens at any other time in the year. Either early Fall, or the Spring months are probably the best times to have cows come fresh. The cow that freshens in December will do little if any better in June and July than the one that freshened in September. Both fall off in the mess at that season. The August or September cow is the one that is likely to go dry the shortest time. The December cow must be fed liberally all Winter on grain if she is to produce a full flow of milk, just as much as the September cow, while the latter has already produced a nice lot of milk at a small cost, thus yielding a profit.

When to Stable.—We do not like to keep our cows in the stable nights until the weather becomes quite cool, so that the cows are more comfortable indoors than out. Sometimes we keep them in earlier, because we wish to get all the manure we can for some certain field. If the pasture is short and the nights not too warm it is all right. If the pasture is good, it is doubtful whether there can be as much milk obtained from feeding sowed corn without grain as from pasture; besides the corn is more costly than pasture. There is nothing better than *good* pasture, and on our cheap lands nothing is so inexpensive for cow feed. The only excuse for us to grow fodder corn, oats and peas, etc., for green feed is the fact that the drought, more or less severe, is quite liable to catch us most years. Even then, if we have a good range of pasture and are not overstocked, we get along very well with only a moderate amount of fodder corn. I find that many farmers are expressing doubts about the advisability of "intensive" farming on cheap land, at a considerable outlay for hired labor.

Profitable Cows.—It isn't always the largest income that gives the greatest profit. Looking over a list of creamery patrons where the cost of keeping the cows was given together with the income per cow, I notice that in different herds the returns for $1 cost in keeping, vary all the way from 50 cents to $1.66. In other words, one man got back from the creamery 50 cents for each $1 worth of fodder given his cows, while another man got $1.66 from the creamery for each $1 worth of fodder fed to his cows. These were the extremes, but there were many other examples very similar. Now, looking over the list carefully, it appears that those who fed the most expensive ration did not in many instances get the best returns. Doubtless much of the difference is due to the quality of the cow, but the dairyman needs to look out also for a ration that is not too expensive. H. H. L.

HOW TO FEED SHEEP.

1. My farm is in southern Ohio. The last of March, 1901, I had seven acres of bottom land sown to Alfalfa, with beardless barley as a nurse crop. Both grew very well. The barley was cut with a self-binder the last of June. The Alfalfa was about 18 inches high at this time. In order to save this Alfalfa the barley was cured and put in the barn in the sheaf. I plan to feed it to breeding ewes. I have 36 open wool ewes bred for Winter lambs, and 39 Merino ewes for Spring lambs. We have hay, mixed clover and Timothy, and corn fodder. I may be able to have some fodder shredded. Have corn, but must buy more. What will make a balanced ration for these ewes? I can get bran at $16 per ton, corn at about 50 cents for 68-pound bushel, and oats at, I think, about 34 cents. Will the barley straw have any feeding value? It is bright, and was not very ripe when cut; butts of sheaves full of fine green Alfalfa. 2. I am feeding a carload of lambs. They are now on Blue-grass pasture, and will soon be on full feed, using corn and some whole wheat. I planned to put them in the feed lot about November 1. I have plenty of good corn fodder for roughage. Lambs will have a good open shed, part of the shed roofed with fodder, after John Jamison's plan. Plenty of good water pumped into a tank; somewhat warmed by a tank heater; have cured some ragweeds to let lambs run to this stack for a change in diet; plan to feed them corn for fattening. Will probably feed till in January. What will be a good ration for these lambs? Ration can include wheat if it seems best. I can sell wheat at 67 cents. M. L. P.

New Wilmington, Pa.

1. I should feed these ewes all the mixed clover and Timothy they wish, and then give them a grain ration of two parts wheat, one part oats and one part bran. Then I should like to flavor this with a bit of oil meal, one of the most highly-prized concentrated foods used by sheepmen. I do not think barley straw will be eaten by sheep very heartily. It has a feeding value only one point greater than rye straw, and considerably less than oat straw. Possibly there may be enough Alfalfa in the straw to make it a desirable feed in your case. If you can get some turnips or any sort of roots for the ewes they will be most acceptable and desirable. If the ewes are in good condition now, and are easy feeders, they should keep in nice shape on a pound of grain a day per head, if they find good clover picking in the hay. The shredded corn fodder will also be eaten with a relish, but it will not be eaten to so much advantage as the clover and Timothy. I regard clover in the East as the best of our dry forages for sheep. These ewes will do very well without any corn at all. 2. Let these lambs have what roughage they wish, and then feed a ration of two parts corn, one part oats and one part wheat, and a bit of oil meal. Towards the latter part of the fattening period I should increase the part of corn slightly and cut down on the wheat. With such a ration the lambs ought to fatten well. It is advisable to keep them in rather a restricted enclosure. Sheep can easily run off fat, and small feed lots and plenty of good feed are requisites where one wishes to feed on flesh rapidly. I should feed grain twice a day, and keep the feed racks filled with hay or fodder of the most appetizing sort. Sheep are so cheap now one must feed economically and make every bit count, and then turn off the feeders just as soon as they are ready. C. S. PLUMB.

BEEF-MAKING IN MINNESOTA.

What is known as Greenwood Prairie, a region in Wabash and Olmsted counties, which was settled in the early fifties, was at one time noted for its great wheatfields. Before the advent of the self-binder, the men who used to "follow the harvest" from Kansas northward all knew that Greenwood Prairie was a place where they might expect to find a "long job" of binding. As the yield of wheat grew less year by year, the farmers of this region turned their attention to barley and then to flax, but the wisest of them saw that something besides grain raising would have to be taken up if the farms were made to pay a profit. Many went into dairying, and several creameries were started. A great many have taken up the raising and fattening of beef cattle and hogs, and a majority of the farmers now have small flocks of sheep. One of the successful beef feeders of this neighborhood is Geo. E. Purvis, of Viola. He has been feeding several carloads of cattle every Winter for some time, and the following is his method: In the first place he says he prefers Polled Angus cattle to any others, and at present is paying as high as 60 cents per 100 more for them than for Durhams. He says that while his ideal feeder is "an Angus with a good broad back, large bony legs, low blocky build and a good paunch for carrying food," any Durham or Hereford with the same qualities will answer.

He begins feeding shock corn to the cattle about October 1, while they are still on grass. The corn is fed to them in yards near the barn, so that the hogs may be turned in to clean up after the cattle. They are given one feed of this shock corn per day for five or six weeks, care being taken not to give them all they want. Then they are put into the Winter feeding yards, where they have access to straw-covered sheds. These sheds are a good protection from storms, but it is a curious fact that the cattle prefer to lie outside in clear weather, no matter how cold it is. From the time the steers are taken from the pastures till about January 1 to 15 they are given one feed of shock corn per day and two feeds of meal. At the start they are given coarse crushed corn-and-cob meal. After three or four weeks, when they begin to show signs of not being very hungry for their meal, a change is made by grinding the corn and cob very fine, then, Mr. Purvis says, "They will come on the run after you when you go into the yard with the meal." This fine meal is continued till the cattle are ready for the market, but is varied whenever they show signs of being tired of it, by mixing in a two-bushel sack of bran in the meal for 40 cattle. The bran is thoroughly mixed with the meal, and the change seems to help their appetite, the same as the change from coarse to fine meal.

These steers are generally marketed in May or June. Last April Mr. Purvis sold one carload of Angus cattle in Chicago for $5.60 per 100 and one car of Durhams sold the same day for $5.40. He fed the remainder of his cattle till the middle of May, and shipped in company with a neighbor who had Durhams. The Angus cattle averaged 1,275 pounds and brought $5.75, and the Durhams averaged 1,285 pounds and averaged $5.55. In feeding shock corn to cattle there would be a very considerable waste if it were not for having something to follow them. Mr. Purvis now follows this plan: After allowing the 40 beef cattle to have what they will eat with a relish, he turns in a flock of 100 sheep, and leaves them two hours; then turns in the cows and young cattle for the same length of time, then gives the hogs what is left. At present he has 30 October pigs, six old sows and 12 60-pound shotes. Those who follow the plan of feeding shock corn to beef cattle and who do not have sheep, usually plan to have the same number of hogs as steers. J. M. DREW.

MILK NOTES.

The milk business at this point is rather mixed. About 40 cans are shipped daily, the rest being manufactured or consumed in the nearby towns. The milk from my own dairy is peddled in Sidney. A new factory for the manufacture of French cheese was started in Sidney October 1. The owner is Mr. Du Para. He pays 5 cents per 100 pounds in advance of condensery. Cows are generally in good condition and prices are well up in this section. The corn crop was good; oats were very light and of inferior quality. Potatoes rotted badly on some farms, but on an adjoining farm a good crop was harvested with very few poor ones. Apples no crop at all. Mill feeds are high. Cornmeal costs us $26 per ton, bran $20, and the others in proportion. E. M. P.

E. Guilford, N. Y.

Some of the farmers have creameries and some use separators. One man with a large dairy still uses small pans, and some contract their milk in the cities of Albany and New York. Others draw their milk to cheese factories and to the station. Most of the cows are common stock, but there are a few fair-sized dairies of registered cattle. Cornmeal is high, from $1.30 to $1.35 per 100 pounds; whole oats 45 cents per bushel. Hay is worth from $10 to $12 per ton. The price of milk at the station is from 60 to 70 cents per can; cheese from 9 to 10 cents per pound. J. B. M.

Richmondville, N. Y.

Prof. Babcock, on page 754, settles a portion of the adulterated milk and cream question in a satisfactory manner, but he seems to have lost sight of a part of the cause for complaint. He says that the use of lime water in milk is all right, because lime water makes it healthy and serves to keep it sweet. I think he is right, for lime water is very good; but, when we as consumers buy milk, we do not want to have to pay six cents a quart for lime water, when we can make lime water for six cents a barrel, I was about to say. I think any foreign substance added to milk is an aduiterant, even though it does improve the milk or add to its health-giviug qualities, and ought to be forbidden.

Troy, N. Y. G. W. W.

I ENCLOSE two more subscriptions at 10 cents for the remainder of the year 1901. Both were former subscribers, but had fallen from grace; I have rounded them up again on probation, and hope they will be taken into full membership at the end of the year. M.

BUFFALO EXPOSITION

—AND OTHER—

SEPARATOR AWARDS.

All sorts of lying and unscrupulous misrepresentation by our disgruntled would-be competitors to the contrary, the following conclusive facts remain true and indisputable.

(1) The De Laval machines were alone chosen and used in the work of the Model Dairy at the Chicago Exposition and achieved their usual complete success.

(2) The De Laval machines received the only award made to Cream Separators by the regular jury of awards at the Chicago Exposition, this jury consisting of some fifteen of the most prominent creamerymen, dairymen and mechanical experts in the United States and Canada.

(3) At the Paris Exposition the De Laval machines received the Grand Prize or highest award, over all competitors from every country, being entered and receiving such award in the name of "Societe Anonyme Separator" which is the French translation of "Separator Corporate Company," the name of the De Laval European organization.

(4) At the Pan-American Exposition the De Laval machines received the Gold Medal or highest award, and the only one of its kind given to Cream Separators alone.

(5) In the Model Dairy at the Buffalo Exposition, the practical work of the De Laval machines easily out-classed that of the only competitor which had the audacity to attempt comparison, as has been set forth in the published statement of the Model Dairy authorities.

These triumphs of the De Laval machines were but natural and logical, being only in keeping with their recognized supremacy in dairying practice in every country, and but illustrations of the nearly 600 First Prizes, awarded the De Laval machines during the past twenty years, including every representative exhibition throughout the world.

Anyone further interested in any of these awards, some of which have been the subjects of recent advertising controversy, may ascertain the full details by simply asking for them.

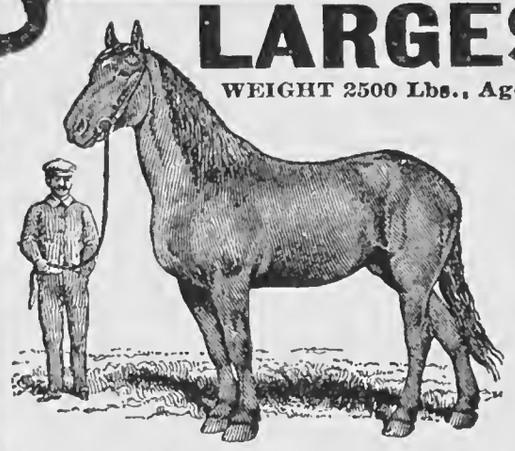
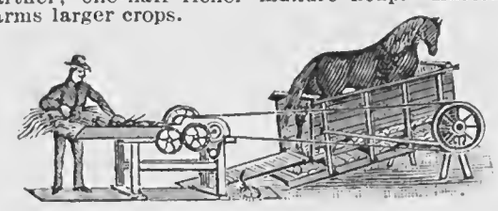
LARGEST FOUR YEAR OLD HORSE IN THE WORLD


WEIGHT 2500 Lbs., Age 4 Years, PERCHERON. Owned by International Food Co., Minneapolis, Minn. We feed "INTERNATIONAL STOCK FOOD" every day to our four Stallions, Brood Mares, Colts, etc. "INTERNATIONAL STOCK FOOD" causes Horses, Cattle, Hogs and Sheep to grow very rapidly and makes them Big, Fat and Healthy. Is used and strongly endorsed by over 500,000 Farmers. It is sold on a Spot Cash Guarantee to Refund Your Money in any case of failure by over 30,000 Dealers. It will make you extra money in Growing, Fattening or Milking. Owing to its blood purifying and stimulating tonic effects it Cures or Prevents Disease. It is a safe vegetable medicinal preparation to be fed in small sized feeds in connection with the regular grain. It Fattens Stock in 30 to 60 Days less time, because it aids Digestion and Assimilation. In this way it saves a large amount of Grain. The use of "INTERNATIONAL STOCK FOOD" only costs 3 FEEDS for ONE CENT. Ask your dealer for it and refuse any of the many substitutes or imitations. It always pays to feed the best. "INTERNATIONAL STOCK FOOD" is endorsed by over 100 leading Farm Papers.
A $3000.00 STOCK BOOK FREE
MAILED TO EVERY READER OF THIS PAPER.
This Book Contains 183 Large Colored Engravings of Horses, Cattle, Sheep, Hogs, Poultry, etc., and of this Horse. It cost us $3000 to have our Artists and Engravers make them. It contains a finely illustrated Veterinary Department that will save you Hundreds of Dollars. Gives description and history of the Breeds of Horses, Cattle, Sheep, Hogs and Poultry.
THIS BOOK FREE, Postage Prepaid, If You Write Us a Postal Card and Answer 3 Questions:
1st—Name this Paper. 2nd—How much stock have you? 3rd—Did you ever use "INTERNATIONAL STOCK FOOD" for Horses, Cattle, Sheep, Hogs, Colts, Calves, Lambs or Pigs. The Editor of this Paper will tell you that you ought to have a copy of our finely illustrated Book for reference. The information is practical and the book is Absolutely Free.
We will give you $14.00 worth of "INTERNATIONAL STOCK FOOD" if Book is not exactly as represented. We Won the Highest Medal at Paris in 1900.
Answer the 3 Questions and Write Us At Once for Book.
Largest Stock Feed Factory in the World. Capital Paid in $300,000.00.
INTERNATIONAL FOOD CO., MINNEAPOLIS, MINN., U. S. A.
3 FEEDS FOR ONE CENT

THE BUSINESS FARMER'S WAY
is to cut and crush his fodder for feed; goes one-half farther; one-half richer manure heap. Enriched farms larger crops.


DAISY CUTTERS AND CRUSHERS WILL DO IT.
Can be used with or without crusher. A size to suit you. Different length's cut to each cutter. Swivel or plain carrier. Fully guaranteed. Horse Powers from 1 to 8 horse-power. Thrashers all sizes. Write to-day for our Special November Offer. It will please you.
ORANGEVILLE AGRICULTURAL WORKS. Orangeville, Pa.

A Bushel In Less Than 3 MINUTES.
That's the way your feed will be ground when you use the
KEYSTONE
Triple Gear
GRINDING MILL.

Built as strong as an anvil. Burrs are of hard white iron. Boxes and guy irons furnished with mill. Capacity of mill from 20 to 30 bushels per hour. We are making a special introductory price now. Write for the catalogue and prices on the full line. Corn shellers, planters, cultivators, feed cutters, etc.
Keystone Farm Machine Co., 1547 Beaver St., York, Pa.

THIS GRINDER IS THE KELLY DUPLEX.

Duplex means that it has a double set of grinding burrs. That means that it is the fastest grinder made, doing double the work of any mill of similar size. Requires only light power.
CRUSHES AND GRINDS Ear Corn, Cob, Husk and All.
Grinds cotton seed and all grains single or mixed. Makes coarse, medium or fine feed as desired
We mail illustrated catalog free on request. Ask for it.
THE O. S. KELLY MFG. CO., Dept. M Iowa City, Iowa. or The O. S. Kelly Co, Springfield, Ohio.

STEVENS

Anti-friction, Bridge tree, Automatic adjusting, Self-sharpening, Covered gears, Light draft, Non-choking Hand, Sweep, and Power farm mills, for all purposes. Will grind all grain to any degree of fineness. Thousands in daily use everywhere. Send for free catalogue C. Agents wanted.
STEVENS MFG. CO., Fisher Bldg., Chicago, Ill.

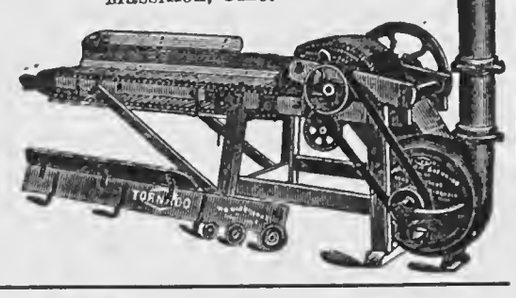
PATENT GROOVED
Tire Wheels

The GROOVE protects the heads of the spokes
For Farm Wagons
Any Size to fit any Skein.
MADE ONLY BY THE
HAVANA METAL WHEEL CO. Havana, Ill.
We are the largest manufacturers of steel wheels and low down trucks in the U. S.
Write for Prices.

BRAND NEW STEEL ROOFING

Bought at Receivers' Sale. Sheets either flat, corrugated or "V" crimped. No tools except a hatchet or hammer is needed to lay the roofing. We furnish free with each order enough paint to cover and nails to lay. Price per square, $1.75
A square means 100 square ft. Write for Free Catalogue No. 67 on General Merchandise. Chicago House Wrecking Co., West 35th and Iron Sts., Chicago, Ill.

TORNADO FEED CUTTING Machinery
Up-to-Date in every Detail.
LARGEST LINE
Blowers or Chain Carriers.
FREE SAMPLE of machine's work and Catalogue upon application.
W. R. HARRISON & CO., Mfrs., Massillon, Ohio.
Patent Pending

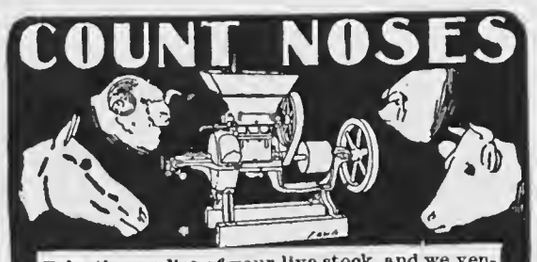


Grinding Mills

Our mills are best for all kinds of grain, and for crushing and grinding feed, corn and cob, clover hay, corn stalks, barley—anything. Sent anywhere on 15 days' trial. Full line of Mill Machinery. Write for Catalogue and discounts
SPROUT, WALDRON & CO., Box 18, Muncy, Pa

Try This Mill
Before You Buy It.
If it doesn't do better work, more rapidly than others costing twice as much, don't keep it. It's

The New Holland
8 Sizes.
Cob and Feed Mill especially adapted to wind-mill and other light power. It is sold at a low price under positive guarantee. Capacity 20 to 100 bu. per hour. Catalogue free.
New Holland Machine Works, Box 115, New Holland, Pa.

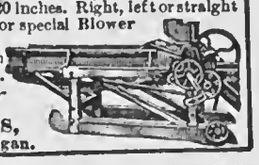
COUNT NOSES


Take the verdict of your live stock, and we venture that it is overwhelmingly in favor of ground feed.
Scientific Grinding Mills
will make more feed and better feed from the same amount of grain. They save time, money and feed. Numerous kinds—both sweep and power. Crush and grind ear corn and all grains separate or mixed. Send for catalog R before you buy. We mail it free.
THE FOOS MANFG. CO., Springfield, Ohio.

The Cheapest Wheels

Are New Wheels, At Our Prices.
We make a great variety. 4 Buggy Wheels, 7-8 in. Steel Tire for $7.50. 4 Carriage Wheels, 1 in. Steel Tire for $8.00. This plan saves expensive repair bills and makes the vehicle practically as good as new. We replace old rubber tires and put on new ones. All goods built upon honor and sold upon their merits. Write for free directions for measuring and price list No. 38.
Wilmington Wheel Co., Wilmington, Del.

CHAMPION HAY PRESS
FAMOUS MFG. CO. CHICAGO

THE AMERICA...
Combined Feed Cutter & Shredder
handles all fodder crops and ensilage. Stationary or traveling feed table. Four sizes—13, 16, 18 and 20 inches. Right, left or straight away Swivel and Giant Elevators or special Blower Outfit. They are doubly strong, durable, fast and efficient. Can be used mounted or unmounted. Send for special Illustrated Catalogue of Farm Machinery.


J. K. WILDER & SONS, Box 20 Monroe, Michigan.

WELL DRILLING Machines
Over 70 sizes and styles, for drilling either deep or shallow wells in any kind of soil or rock. Mounted on wheels or on sills. With engines or horse powers. Strong, simple and durable. Any mechanic can operate them easily. Send for catalog.
WILLIAMS BROS., Ithaca, N. Y.

ICE CUTTING requires fast working tools at right time. RED, WHITE AND BLUE ICE PLOW is a first class, keen, fast cutter, having our Patent Clearing Teeth. Specially adapted to the use of Dairymen, Butchers, Hotels, Farms, etc. Two sizes, Cuts 7¼ and 9 ins. Prices Low.

Write us for Free Catalog of all kinds ICE TOOLS.
AMES PLOW COMPANY, 54 Market St. Boston, Mass

$10.40 BUYS this 55 gallon Food Cooker

complete with cover, elbow, pipe and damper. Kettle is polished and smooth. Jacket made of heavy steel. Burns any kind of fuel. Flues distribute heat all over. Boils 50 gallons in 20 minutes, cooks anything. Handy for butchering and a hundred other things on the farm. Other sizes, 18 to 75 gals., at reduced prices. Send for large free Catalog giving prices on 15,000 articles.
Marvin Smith Co., 55-59 N. Jefferson St., Chicago, Ills.

Can You
do a little pleasant and profitable work for us in your own town? No experience necessary. We will explain just what you have to do. The work will be light, and we will arrange for the time you shall be able to give to it. We can give you work for all your time or just for your spare time. Write for full particulars. THE RURAL NEW-YORKER, New York

"The Steel Plate Rural Box."
That is the way in which thousands of users all over the country refer to our "Uncle Sam's Favorite" Mail Box. It tells the truth. Ours is the only box on the market that is stamped from heavy steel plates, formed to shape by special machinery and riveted together (not soldered). The government requires the use of an approved box. Ours is
Approved by the Government.
It is 16 in. long, 6 in. wide, 6 in. deep in front and 10 in. deep at the back. The spring, hooded lid always stays closed and will not admit rain, snow, etc. Has signal to show when mail is to be collected. Has letter holder and change holder inside. Finished in aluminum with your name on in black letters. Sample box sent express paid for $2.00. Larger quantities at lower rates. Send for free illustrated Booklet. Tells all about it.
BOND STEEL POST CO., ADRIAN, MICH.

REMODELING AN OLD ORCHARD.

WHAT TO DO WITH OLD TREES.

Practice and Helpful Suggestions.

ORCHARD VETERANS.—On almost every farm long settled are to be found old apple trees which seem to have outlived their usefulness. Dying and dead branches fill the tops; great gaping holes show where large limbs have been cut away, and the stump has rotted far into the center of the tree. Such trees are commonly worthless. They are cut down and burned, or the suckers are allowed to struggle with the dead branches and with each other in the battle for light and food. They often stand near the buildings or along the fences, where trees are wanted as long as they can be kept. Possibilities, not often suspected, still exist for these old trees. Here and there a thrifty young sucker has found a chance to grow and has soon come to be a vigorous branch. Fruit of good size and quality is often found upon it. Indeed, if the tree bears any good fruit it is likely to be on such branches.

A CHANCE FOR YOUNG BRANCHES.—An apple tree and a grapevine differ materially, yet it is possible to take a lesson in the management of the tree from the habit and treatment demanded by the vine. The vineyardist knows that he must depend upon young wood to get good grapes. He will tell you that it is better to replace the main vine every few years with a young shoot starting from the ground, because the old stock becomes "clogged." He may not be able to explain just what that means, but he knows that he gets better grapes from the young vine. Much the same thing holds true of an apple tree, though the time of renewal is much longer in coming than with a grapevine. The oft-repeated advice to avoid cutting large branches in pruning, while perfectly proper for young and vigorous trees, may be all wrong for these old veterans which have already begun to decay. Cut away the old decrepit branches and give some of the vigorous young suckers a chance. They will soon prove that they are not enemies to be cut down at every encounter, but friends ready to lend a hand and bear good fruit at the first opportunity. Fig. 362 shows such an old tree, with its top full of dead branches but no fruit. Fig. 363 shows the same tree as it appeared half an hour later. Nearly all the large branches are on the ground, but enough vigorous young sprouts are left to form a new top, which, barring accidents, they will quickly do.

OBJECT OF PRUNING.—But, some one objects, the tree will be short-lived, the wounds will not heal, and rot will enter the tree. Very likely, but what of it? The tree is nearly worthless as it is, and this treatment is likely to give a few, perhaps many, good crops. It is worth while to get them, for we do not want the tree to die now, and it will not unless we kill it. If left to itself it will linger on, occupying the ground just the same and doing nothing. The purpose for which an apple tree is grown differs radically from that for which a forest tree is grown. For the time being it matters little whether the heart of the tree be sound or hollow, so long as the outer wood and bark are in condition to perform their functions in carrying food and producing growth of leaf and fruit. I trust that no one will consider this an argument for lack of care in pruning young trees. Decay threatens the life of the tree, and should be avoided as long as possible. Fig. 365 represents a tree pruned much after the same manner, perhaps not quite so heavily, but severely enough that a bystander said the pruning would kill it. The tree was pruned in Spring. This picture, taken in the Autumn following, shows a fair crop of apples.

A TREE FULL OF DEAD BRANCHES. FIG. 362.

THE OLD TREE PRUNED FOR RENEWAL. FIG. 363

STARTING A NEW TREE.—Even if the whole top is worthless the case is not lost. Many of these old trees are seedlings, bearing fruit of little value. In such cases we may follow the vineyardist still further, and start a new shoot from the ground to take the place of the failing trunk. Fig. 364 shows such a sucker grafted the preceding Spring. The natural inference may be that a tree started in that way will have little value, but facts often disprove theories. If the old tree is cut away after a year or two the graft soon takes its place. At Fig. 366 is shown a larger tree started in the same manner. It is now about eight years old, and very vigorous. The owner says that it bore fruit the next year after the graft was set, and has borne nearly every year since. The method here outlined may not prove advantageous in commercial orcharding, nor in all parts of the country, but the results seen certainly indicate that they are worthy of consideration oftener than they are used. The same methods of renewal are applicable to peaches and pears. It goes without saying that wherever applied they should go hand in hand with other methods of treatment needed to produce good fruit.

FRED W. CARD.

A TALK ABOUT PEDIGREE TREES.

What Grant M. Hitchings Thinks.

We have had several articles about the famous orchard of Grant M. Hitchings, of Onondaga Co., N. Y. The following opinions will interest most apple growers. We asked Mr. Hitchings whether he believes in using wood from first-class bearing trees for budding and grafting:

The theory is certainly all right, and I am watching and experimenting along that line.

What, in your judgment, has most to do with fine fruit production?

The evidence thus far seems to indicate that the soil and location, and principally the way the fruit buds have been nourished, has more to do with producing fine fruit than anything else.

What evidence have you of this?

We have four Northern Spy trees about 30 years, set in squares 25 feet apart each way. Two of them on the south side invariably gave larger and finer fruit than those on the north side, which were crowded by other trees. Five years ago one of the trees on the north side was broken down, also those that were crowding the remaining one. Since that time this tree has given just as good fruit as the two south trees, showing in this case that it was lack of nourishment from limited root pasture, instead of bud variation.

We understand that you have trees which began to bear six years from setting.

The six-year-old trees (Spy) that bore this year were purchased of a Syracuse nursery. There were 150 in this lot; nearly all had a few apples on them this year, and all of them were similar in type. They have all been carefully mulched to strengthen bud formation. The eleven and nine-year-old trees that bore heavily were from different nurseries, and I could see no difference in type.

Do you observe much difference in the same variety?

I have a Fameuse that always produces pale fruit, and also those that produce red fruit. Next Spring I am going to graft a Ben Davis that produces bright red fruit with a graft from the pale Fameuse, and a graft from the red Fameuse, and see whether the type holds good in the new surroundings. The pale Fameuse is crowded by a Trancendent crab, which is a gross feeder, and that may be the trouble with the color.

You think, then, that crowding the trees too close together will give light-colored fruit?

A Wealthy tree at first gave high-colored fruit, but its root pasturage is becoming restricted by other trees, and I notice that each year its fruit is becoming paler. I observed this year that when a tree is heavily loaded the lower apples remain pale until the upper ones are picked; then the lower or pale ones color up, showing that the tree didn't have strength to color up all at once. I notice that the same variety behaves differently in different locations, in size, color and quality.

What can the orchardist do then to know that his fruit will be first class?

It seems to be a case of each one finding out for himself what is best for his particular location. Now, as to what I am doing this Fall, I have ordered 125 Spy, 75 from a Syracuse nursery, 50 of Rogers pedigree trees. The trees from Syracuse are grown on heavy clay, rich in potash, and are full of vitality. The pedigreed trees are smaller, but have a known parentage. I shall watch their development with interest. The trees from that heavy clay have always started better with me than the trees from other nurseries.

What would be your advice to a beginner?

I would hunt for trees four or five years old, one and one half to two inches through, that stand from four to six feet apart in nursery row; have had good root pasturage and appear very healthy. These trees must have stored up in their tissue a good deal of vitality, and I think they would soon come into bearing if one would nourish the buds during Summer and Fall and not stimulate wood growth by Spring cultivation. Mulch the trees when first set to hold moisture until roots become established, and then let grass in Spring take up fertility and prevent excessive wood growth. Letting this grass decay on ground during Fall to feed the fruit buds is the keynote of my practice. Doing this saves a lot of labor, and I believe it is in the long run the best way.

Then you would not bud or graft with wood from your best trees?

I have hardly confidence enough in the plan to warrant me in going to all the bother of doing it for myself, the results from so many varieties being satisfactory the other way. I have tried some pedigree strawberry plants alongside of others, and the pedigree failed to pan out. The plants that didn't have any pedigree were rather the better in fruiting. Yet, notwithstanding the evidence seems to indicate that it does not appear to pay to bother with "pedigree trees," I am buying them, and paying more for them, for the theory seems all right, and if there is anything to it I want to be in line.

Shall you make any change in your plan of setting the trees?

I am setting the rows 38 feet apart and 30 feet in the row, every other one a Spy. I shall use Wagener, Sutton Beauty and Rome Beauty as fillers. I am also setting 400 plums this Fall, and intend setting 1,000 peach trees in Spring, and shall follow the same method of culture with all. I have 200 pears, 1,800 apples now set, and am planning to increase apples up to 2,500.

TOMATOES IN MEXICO.—The latest idea for getting rich at farming is reported by an Oregon man, E. P. Cadwell, who is reported as saying: "Tomatoes will be 10 cents a pound in January, and we have already 50,000 plants set out in Mexico that will bear fruit by that time. We will ship the tomatoes in refrigerator cars and land them in Chicago, within a few days after they are picked. On arriving at their destination the cars will be run into warehouses heated to a degree that will enable the shipments to be unloaded without danger of freezing. One of my acquaintances has made $100,000 in five years raising tomatoes for the American Winter supply. Labor is cheap and the Mexican government is not averse to American capital being invested there, and so we anticipate smooth sailing." Tomato talk costs no more than any other sort.

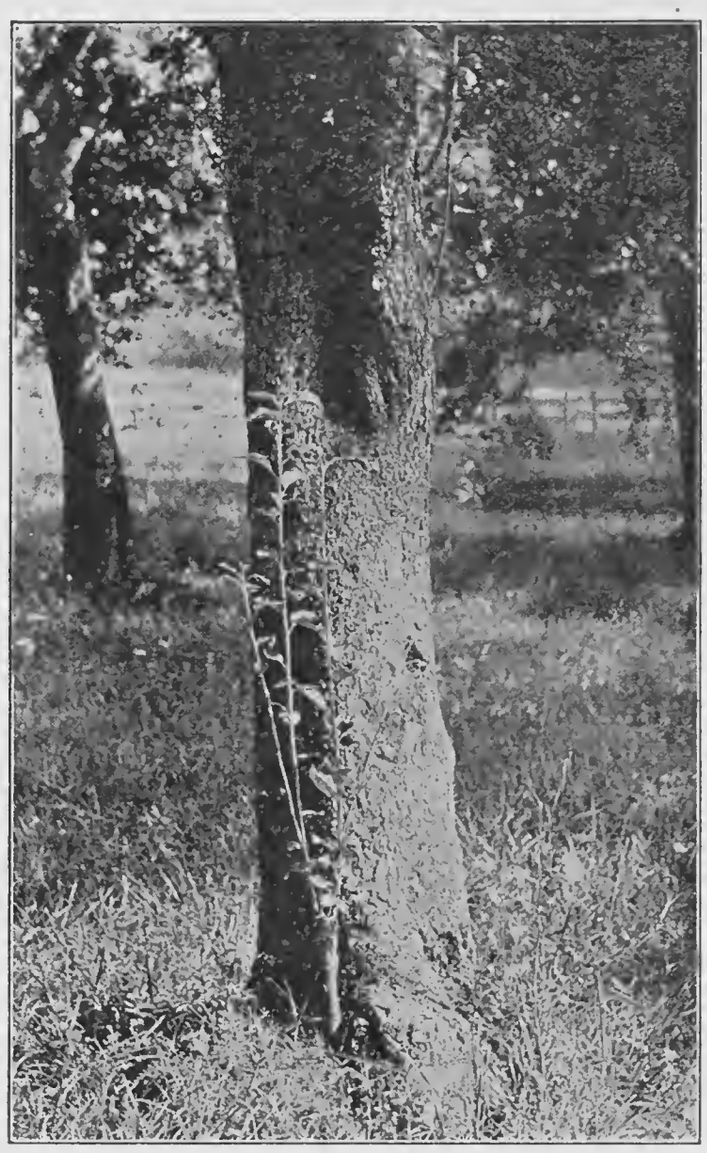
A TALK ABOUT FERTILIZERS.

PART I.

I wish to use chemical fertilizers but am not able to decide what my land needs. It seems to me fertilizer manufacturers would help to a more intelligent use of their goods if they would give a farmer some method by which he could determine what chemicals his different fields and crops need. Many farmers are condemning artificial fertilizers and saying that the old method of manuring with lime and barnyard manure will be resorted to again and chemicals dropped largely. What wonder is this when two farmers will use the same kind of fertilizer and have different results? Others say that they have used the chemicals and have seen no benefit. One man claims that the use of South Carolina rock has rendered his land sour, and clover will not thrive on it. What constituents of chemical fertilizers have a tendency to make land acid? I believe nitrate of soda and barnyard manure have a tendency to sweeten the soil. This latter is proved in potatoes grown on ground manured with stable manure and showing scab. The scab does not show on a sour soil. Are there any trees, plants, grains, or grasses, that are usually grown by farmers, that show by their condition of growth what plant food they have a surplus of or what they are deficient in? If not, what can be planted as an experimental plant in cultivated crops that would indicate what the soil needed? If the soil is acid, what crop removes this acid more than others? I have heard a strawberry grower say clover always came in the ground profusely where he grew strawberries. Did the strawberries take an acid out of the soil and make it sweeter for clover? Is there not a work on clover and its uses?

West Chester, Pa. G. R. L.

Our experience is that there is not much complaint from those farmers who use fair amounts of high-grade complete fertilizers in systematic rotations.



BEGINNING ALL OVER AGAIN. Fig. 364.

By "complete" fertilizer we mean one containing nitrogen, potash and phosphoric acid in proportions suited to the crop. By "high-grade" we mean mixtures in which the nitrogen and the phosphoric acid are in several different forms.

We observe that complaint usually comes from those who use very small amounts of these high-grade fertilizers or from those who use low-grade or "cheap" goods. By "low-grade" we mean a mixture which usually contains only one form of nitrogen and but little of it, and a small amount of some crude form of potash. A mixture of dissolved phosphate rock with a small amount of tankage, or fish scrap, with enough kainit to give a low per cent of potash, would be what we call a low-grade fertilizer. On a heavy clay soil with a rotation including clover such a mixture might give fair satisfaction for some years. Another farmer on a lighter soil might find it very unsatisfactory. This result would not prove that all chemical fertilizers are useless, but it would show that the soil of that farm needed more nitrogen and potash than the low-grade mixture supplied. If a farmer on poor, light soil were to use manure that had been leached out by rain, so that the liquids ran away, he would find that it gave little better satisfaction than the low-grade fertilizer. This would be for about the same reason, for in one case Nature washed the nitrogen and potash out of the manure, while in the other case the manufacturer never put these substances into the fertilizer. Few farmers who use the high-grade complete fertilizers in fair quantities and in a reasonable rotation, seriously talk of giving up chemicals entirely. There should be no "wonder" about it, for it is simply impossible to make an excess of phosphoric acid supply a deficiency of nitrogen and potash.

There are various ways of testing the soil to determine what element is needed. What is known as the "litmus test" will indicate the need of lime. We have explained this test several times. A surer test is to put the lime on parts of the field and thus give a chance for comparison. To make this test a farmer should use a complete fertilizer, so that any shortage in the crop will not be due to a lack of either of the three elements. Then take strips through the field and use, in addition to the fertilizer, lime at the rate of 1 to 1½ ton per acre. This lime should be put broadcast on the furrows and harrowed in. Make these strips large enough so that they will represent a fair share of an acre. Observe the growth of the crop on these limed strips and measure it accurately; do not guess or trust to the eye. This will give a sure indication as to the need of lime.

To test the soil as to its need of nitrogen, potash and phosphoric acid, four such strips may be used. On one we would use a mixture of nitrogen and phosphoric acid; on another potash and nitrogen; on another potash and phosphoric acid, and on another all three. Fair comparisons of the crops produced on these strips ought to tell the story as to which element is most needed. To furnish potash for this experiment we should use muriate or sulphate of potash at the rate of 200 pounds, or one bag, per acre. We would use dissolved phosphate rock or bone black at the rate of 600 pounds per acre to furnish phosphoric acid, and nitrate of soda at the rate of 300 pounds per acre to furnish nitrogen. In such an experiment we should sow broadcast these chemicals after plowing, and harrow them in At the experiment stations, plots of various sizes would be used for this experiment, but for a farmer it seems to us more desirable to use strips of several rows directly through the field. This is more practical as regards the crop, and also gives a better test of the whole field. It is true that dissolved phosphate rock, when used in large quantities, does tend to sour the soil. The same is true of sulphate of ammonia and probably to some extent of muriate of potash, though these are not always used in large enough quantities to show any injurious effect. The ammonia in farm manure is alkaline and will, to a certain extent, "sweeten" the soil much as lime does. It is true that potato scab appears to thrive best when the soil is alkaline. The plowing in of a green crop, or the use of dissolved phosphate rock in the hill or drill, may keep the soil acid and thus reduce the growth of scab, or the use of lime or manure may so "sweeten" the soil as to increase the action of the scab. We will try to answer the questions regarding the behavior of plants in an acid soil next week.

COW PEAS IN DELAWARE.

I read with interest the article on page 770, entitled Cow Peas at the North. I hope that S. B. Robbins will not make a failure of his peas by planting too early next year. The first week in June is early enough to begin planting cow peas here, and our seasons are nearly a month earlier than Massachusetts. The Mt. Olive is a good variety for the North, as it will mature pods in 65 to 70 days, and makes a good, strong, bushy vine. They grew vines over four feet high and heavily branched this season. The seeds of Mt. Olive are much smaller than the large Early Black peas, and one bushel of Mt. Olive seed is plenty for three acres. I drill them in rows 32 inches apart, and cultivate about three times. W. L. M. will find that both his cows and hogs will eat peavines with great relish if he feeds very lightly at first, until the animals acquire a taste for them. I find that it pays well to drill in about 300 pounds per acre of acid phosphate and potash mixture with the cow peas. The present Fall weather has been very favorable for securing cow-pea seed of excellent quality, but these seeds will never be grown on a large scale, or become less than $1 to $1.50 per bushel in price, until a practical steam-power thrasher is introduced, which will bull out the peas without breaking them.

PLOWING UNDER THE VINES.—W. L. M.'s plan is a good one where a hand plow is used, and I formerly practiced it, but with the extremely heavy growth which we obtain here it was a slow and tedious job to turn them under. This year we used a double disk plow drawn by four horses and turning two 11-inch furrows. The operator rides, and any boy who can manage the horses can do good work with it. This plow will turn under the heaviest growth of vines without any clogging whatever. It covers the vines completely and leaves the surface almost as smooth as if harrowed. This plow will also do excellent work in plowing under clover, tomato vines, corn stubble, wheat stubble, etc., but does not work well in sod. E. G. PACKARD.

THE PRINCIPLE OF REFRIGERATION.

Having my ice-house floor to repair, with adjoining refrigerator room, will you aid me by stating the scientific principle and practical arrangement regarding circulation and drainage of same? E. P.

Mt. Lebanon, N. Y.

The principle of cold storage or refrigeration by ice is very simple. From the fact that cold air is found in the lower strata and warm air in the upper, we see that the cold air is heavier and so gravitates, crowding out the warmer air, which at once is forced to seek a higher level. The practical application of the principle in refrigeration is found in first building a room thoroughly insulated by a series of air chambers in the walls and ceilings, each one independent of the other, made so by matched lumber thoroughly seasoned and a good quality of building paper. These air spaces need not be over two inches, and for best service probably not less than five of them should be placed in the side walls. The windows will need be trebled, or better, four in each space.

These dead-air spaces are non-conductors of heat, and an absolutely uniform temperature can be maintained. The ice is packed in the upper part of the building. The whole surface remains exposed to air action. This space is in direct communication with the storage room below. There are different systems of flue communication; for the cold air downward and the warm air upward. It is nothing more or less than a perfect system of ventilation. The flue construction must be so built that a continuous change of air is going on in every point in the rooms; otherwise the temperature could not equalize. The cold-air flue may be the inside dead-air space opened at top and bottom, or a separate flue may be built into any part of the room. The outlet or warm-air flue is built in some opposing direction from the cold-air flue. These flues work with certainty, because the room is so thoroughly insulated that no counter air currents are formed.

In cold storage, of course the ice is not disturbed after it is packed. I might add that a man of experience should be consulted in order to have structural strength to support the great weight of ice above. A large cold storage plant near here came near collapsing under its heavy burden of stored ice above. One is safe in figuring on a temperature of 38 to 40 degrees with the above system. If a freezing temperature is required, galvanized iron tubes a foot in diameter, or perhaps if much work is to be done, a trifle larger, may be placed at intervals in the room, coming to the floor with a drip and extending above to ice chamber, where salt and crushed ice are filled in as fast as melted. In the northern latitudes, where ice is a certainty, the system is a safe and economical one. Where a higher temperature than 40 degrees is all that is needed, and it is not convenient to pack the ice above, a rack may be built in the room from the ceiling down two or three feet, and occupying perhaps one-tenth of the size of the room. Provide a galvanized drip under the rack leading to the drain, and if the room is carefully and thoroughly insulated good results will be obtained. The system, however, necessitates heavy labor to handle the ice. A very good work on this subject is published and may be had from the author, Madison Cooper, Minneapolis, Minn. H. E. COOK.

THE MILK SITUATION IN NEW YORK.

Result of a Co-operative Enterprise.

Conceding the fact that not all of your readers are familiar with the coöperative movement among the farmers at this place and around here in various directions, I will say that it began to take form in a common-sense way a little short of two years ago, through the organization of a stock company, capitalized at $3,000. The company at once began the erection of a plant to be owned and operated by themselves, which was ready to receive milk April 1, 1900. All but two of the producers of milk were united. The consequence was that the man who had received the milk at his own price and terms, without the producer having a word to say, was compelled to buy the milk at 10 cents off condensery price for six months. At the expiration of his time, being a memmer of the Exchange, he refused to buy except at Exchange prices. The Association took their own milk and made it into cheese for several weeks, when they sold to another buyer at satisfactory prices for remainder of six months. By this action they about paid for their plant by what they received above Exchange price. The same persons continue to buy our milk under contract till April next. The old station was torn away last Spring, but a feed building was bought last Summer and changed to a shipping station by another man, and receives only about four small dairies. Milk is being shipped from our plant drawn from another association of farmers at Poolville. Price for October was $1.06 per 100 pounds; November, $1.17 per 100. Cows are in good condition to go into the Winter. Nearly every producer has a silo, and as a rule will not feed much extra on account of its being so high in price that it will not give a profit. Many of the Winter milkers have been brought up at good prices and shipped away, owing to the fact that farmers would rather sell than pay the high prices for feed, and as a result not as much Winter milk will be shipped as heretofore. At this season of the year the milk is only drawn once a day. All the producers of milk to ship should organize into associations, and take steps at once to build plants under direction of the F. S. M. P. A., so they will be in position to make

HEAVY PRUNING DID NOT KILL. Fig. 365.

prices on their own product, and in this way compel the buyer to meet it and become a party to its sale. W. F. JAQUITH.

Earlville, N. Y.

Handled by a Creamery.

Our milk here is not shipped; it is made into butter by the Standard Butter Company of Owego, the largest creamery company in the world. The skimmilk is made into sizing. Farmers get the whey and buttermilk back free of charge. It makes a good feed for hogs. They pay what they call road prices; that is, the same as the shipping stations. Our creamery is on the main line of the D. L. & W. Railroad; that is the reason they pay road prices. Seventy cents per 100 pounds is the lowest they have paid this year. November 1 the price went up to $1.12 per 100. Cows are in fine condition to begin Winter. Feeds of all kinds are very high; gluten $23 per ton, bran $20 per ton. Nearly every dairyman here has a silo. Some of the dairymen are talking

YOUNG CHILD OF AN OLD TREE. Fig. 366.

of feeding beet pulp the coming Winter on account of grain being so high. We get our beet pulp from the factory at Binghamton. Potatoes are a good crop; some pieces rot quite badly, shippers paying 45 cents at the car. Oats are a poor crop; buckwheat good, some pieces yielding as high as 40 bushels per acre. Weather fine; we had no rain since October 6 until November 12. F. L.

Lounsberry, N. Y.

HANDLING DRY CORN FODDER.

Snapping Off the Ears.

For the past 10 years I have practiced picking the ears off my corn at the cutting time, that is when the corn is glazed, throwing four rows into one and letting it stay until cured. I cut the fodder, put it into the silo, and my stock eat it all. The corn cures nicely. I have 400 bushels in the crib now of as nice corn as anyone ever saw. G. B. H.

Moodus, Conn.

Varying Results as Silage.

Four years ago I was in Schuyler County, N. Y. A well-to-do farmer there had a large field of corn. He got a corn husking machine that was owned in the town, and had the corn husked and stalks cut in one operation. They were run in a silo, plenty of water poured on and a little salt sprinkled in at intervals of about every half hour in steady running. The machine did fine work; the corn was husked nearly as well as by hand. The silage was fed to young cattle and sheep with clover hay once a day, and they seemed to eat it about as clean as though it had been green corn silage. It was a big saving from the old way of feeding the stalks whole, and having the stalks in the manure. Another farmer near there had his dry stalks shredded and stacked. About a week after the stack reminded one of an Indian tepee, as there was smoke rising from the center of the stack all the while for over a week. When he opened the stack the center was burned up and half the stack worthless. J. S. J.

Elmira, N. Y.

"Dry Silage" or Hay Sandwich.

I was much interested in reading the article by E. G. O. on page 754 in The R. N.-Y. Being obliged in some respects to use my cornstalks dry to feed, I am always interested in reading anything pertaining to it. I am very much in favor of green silage, but being so situated that I cannot have a silo, I have to resort to the dry silage, as some call it. I have to hire most of my pasture for my small herd of cows, and I find by using dry silage I can keep them through the six Winter months for about as much as I can through the Summer months. A very good plan to handle dry fodder is followed by one of my neighbors, who cuts all of his fodder at one cutting, though most of them in this vicinity cut about what they will feed in two or three weeks. On about July 1 he cuts his meadow grass, such as is grown on smooth meadows, and lets it cure one day; then it is hauled to his barn and immediately cut long; then placed where it will be handy to get at when his fodder is out. As soon as his corn is fit to cut, when the ears are glazed over, he cuts the corn in the ordinary way in shocks. About three weeks after cutting it is husked and bunched, about eight or nine shocks to the bunch. After it stands this way about three or four weeks, so that it is quite dry, he draws it to the barn and cuts it one-quarter inch, mixing in, as he cuts it, the meadow hay, which is about one-fifth of the quantity of his fodder. This mixture is put into a shed which is built adjoining his barn. He does not use any water, and is not particular to have it trampled very hard. At the time of feeding, about December 15, it has heat enough to make the hard part of the cornstalks soft and easy for a cow with poor teeth to eat. He feeds this to all his cows and young stock, and some to his horses. I do not know how long he has done this, but for at least five years to my knowledge. C. C. Z.

Norwich, Conn.

RAISING SQUABS.—I think Johnson & Reed, page 745, have not done as much in the squab business on the producing end as the selling end. It is not the age of the squab that makes the fat, as after about 25 or 30 days from shell they will begin to grow poorer. It is the breed and the feed. Homers are the best breed, all things considered, and corn, peas, wheat and hemp seed the feed that makes the birds. J. E. S.

SMALL FRUIT PACKAGES.—We have always shipped grapes in pony baskets till this year. We are using pony baskets with no handles or covers, and put 10 in a crate for our bagged grapes. We have tried the bushel boxes this year in a small way for pears and apples for our local trade. We are much pleased with them and expect to use more next season. In our experience the fruit carries much better. B. J. CASE.

New York.

POULTRY FOR WOMEN.—The suggestions to the young girl who wishes to make money on her father's farm are both interesting and helpful. In urging her to try poultry I hardly think sufficient prominence is given to the incubator and brooder method, which, after one season's experience, seems to me to be the method when profit as well as pleasure is desired. In my case the chickens were raised in addition to housework, care of a dairy, etc., and the conditions may easily be made more satisfactory. The feed, too, was bought at too high a rate. Taking these facts into consideration, besides the absence of knowledge and experience, I am well satisfied with the little venture. At 10 weeks old Light Brahma broilers weighed 1½ pound. The feed had cost five cents per head, and they were selling at 25 cents per pound in the neighborhood. They do not raise themselves, but I believe time and care are very profitably spent upon them. A. E. F.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Vinegar in a Wine Barrel.

E. S. B., Connecticut.—I put a lot of cider temporarily in a barrel which had contained wine, and am now told that it will never make vinegar, even though I put it into another cask. Is this so?

ANS.—If any large quantity of wine were mixed with the cider, it might hinder it from becoming vinegar, but merely to put the cider into an empty cask which had contained wine will not affect it in the least, and there should be no difficulty in getting as good vinegar from it as the cider would make under any other conditions.

Some Peaches for New Jersey.

W. D. H., Deckertown, N. J.—When will Crothers peach ripen in northern New Jersey? How is it for size and beauty? Also, when will Cooper's Late ripen, and would you recommend it for this section. Can you tell me about Matthews and Emma?

ANS.—The Crothers peach ripens about with Smock, which in northern New Jersey is not far from October 1. It is a white-fleshed peach, having red cheek, and of excellent flavor. Cooper's Late I do not know. Matthews is a medium early peach of general good qualities. I think it well worthy of trial to say the least. Emma is much like Elberta, but a week later. It has no points that would make it more desirable than Elberta, unless one a little later is desired. H. E. V. D.

Is Spring Budding Practical?

G. H. K., Knoxville, Tenn.—I have some peach seedlings that I did not have time to bud in August. Can I do so early next Spring or Summer? If so, how must I get buds and how set them and care for them afterwards?

ANS.—Spring budding is done occasionally and it is practicable, although my own work at it has not been very successful. The bud sticks or scions should be cut before severe Winter weather and stored where they will be both damp and so cool that they will not start in the least, until after the Spring is so far advanced that the bark will peel on the stocks. The best place is in some good cold storage house, but they may be packed in moistened moss or some other material that will not dry out easily. The buds should then be set in the ordinary way, and very securely tied. A friend told me lately that he slightly waxed them over to prevent the sap from drying until the healing process was completed. I have never tried this plan but mean to do so. Tying with waxed cloth would seem to me equally good and a little more economical of time. The tops of the stocks should be cut away as soon as the buds have set, and the sprouting and tillage should be the same as for any budded stocks. H. E. V. D.

What to Do for Peach Trees.

G. E. L., Afton, Va.—I have about 100 peach trees, two years old, which made poor growth the past season on account of not being cultivated early. The land is fairly good and somewhat gravelly. What treatment would you suggest for them next season? What fertilizers should be applied and what amount?

ANS.—These trees should be cultivated without stint from now on. The lack of tillage is given as the chief cause of poor growth, and the most important thing to do is to try to make amends for the neglect. It will doubtless be wise to apply fertilizers, and the sooner potash and phosphoric acid are put into the soil about the trees the better it will be; for the materials that are most generally used that contain them, such as muriate and sulphate of potash, will dissolve slowly and need some time to become available. Fall applications are very timely. But it is not so with nitrogenous manures. The nitrogen, if in an easily soluble form, as in nitrate of soda, will be lost to a considerable degree before the growing season comes. I would suggest making a mixture of 500 pounds of muriate of potash to 1,000 pounds of dissolved phosphate rock, and give each tree 10 pounds of it, scattering it well and cultivating, plowing or digging it into the soil. This I would do without any unnecessary delay. Then next May I would apply one or two pounds of nitrate of soda to each tree, working it into the earth in the same way.

The "Ox-Eye Daisy" in Minnesota.

Several Readers.—It is reported that the Legislature of Minnesota has made the common daisy a "legal outcast." Is that a fact?

ANS.—Yes; the Legislature passed the following bill, which was approved April 14, 1901:

SEC. 2. Any person who shall encourage, permit or allow the weed commonly known as the "Ox-eyed Daisy" to grow upon any land owned, controlled or in the possession of such person within this State, or who shall transport such weed from one place to another within this State except from one place to another on the same farm, lot or estate for the purpose of its destruction, or who shall allow the same to grow in any greenhouse or garden under the control of such person, or who shall exhibit for sale or have in his or her possession for sale, or shall sell any of such weed; and any person who shall have in his or her possession for exhibition, or shall exhibit at a public or private flower sale or flower show, or place where flowers are kept for sale or show any of such weed, shall be guilty of a misdemeanor, and, on conviction thereof, shall be punished by fine of not less than ten (10) dollars, nor more than one hundred (100) dollars, or by imprisonment in the county jail for not to exceed ninety (90) days.

That bill is certainly what one may call "a daisy." As one of our correspondents remarks: "It seems to me that imprisonment for 90 days is a pretty severe offence for allowing Ox-eyed daisies to survive on a farm. To enforce such a law would mean, I imagine, that a large portion of the population of New England would go to jail; the decision also to extend the punishment to those who grow the weed in hothouses and who sell the same is to my mind high-handed legislation. I fear that some of our legislators have not quite enough of work to keep them busy."

Rye as a Money Crop.

G. H. E., Peace Dale, R. I.—I am considering the improvement of a run-down farm. I have noticed several articles in THE R. N.-Y. which seem to indicate that when properly handled rye is a profitable crop to grow. Will you please give me information regarding the best time to cut for market, that is, before the grain is mature or after maturity; the size, shape and weight of bale, with the form of press best suited for baling? If allowed to mature the grain how should it be thrashed? Will the same press which is used for straw also prove to be the best for baling hay, or is a smaller, more compact bale required.

ANS.—On poor land near the large cities rye ought to prove a good crop. It is a good crop to start with in improving poor land, for it responds well to fertilizers, and is a fine crop in which to sow clover seed. Near a large market the straw may be sold in small bundles, for it brings more in this form than in bales. Our rye straw is bound as it comes from the thrasher, which delivers it without crushing or breaking. The heads are thrashed out, and at the back of the machine is a device much like that on a twine binder, which ties the straw into bundles of about five pounds each. If it is possible for you to sell the straw in bundles, we would advise you to do so. We cut the grain at maturity—when the straw is a bright yellow and the heads are thoroughly ripe. This gives stiffer and harder straw, which is what stable keepers want. We understand that in sections where the straw is baled the same press is used for both hay and straw. Small lots of straw are thrashed out by hand with flails, but the machine we have mentioned will do the work well without breaking the straw.

Is Rubber-Growing Profitable?

W. E. B., North Baltimore, Ohio.—There are a number of companies advertising rubber, coffee, and other plantations in Mexico, Central America and the West Indies, and, while I understand that you cannot say anything as to their responsibility, etc., your reading and observation will doubtless allow you to answer the following through THE R. N.-Y.: Is a rubber plantation practicable? At what age are the trees first tapped and what is an average product per tree? Are there well authenticated examples of successful plantations? What are the objections against risking investment in such enterprises?

ANS.—After a careful investigation of the subject of rubber culture, through some of the foreigners at the Pan-American Exposition and a specialist of our own people who has been in the tropics of America on purpose to study this subject, it may be said that the culture of the trees which produce rubber is perhaps practicable in some peculiarly favorable locations in the tropics of Mexico, Central and South America and in the West Indies. There are a number of plantations of Ficus elastica and some other species, made with a view to commercial profit, but up to this date none of them is old enough to make a fair test, so far as I have learned. As there have been very few attempts at tapping these planted trees, it is impossible properly to estimate the amount that each may produce or the proper age at which tapping ought to begin. It may be a wise thing to invest money in a rubber plantation in a suitable place, as in the moister parts of Cuba or Porto Rico, but that is a question that is not well settled. The increasing demand for rubber, because of the many new uses to which it is constantly being put and the rapid extension of marine electric cables would lead one carefully to investigate the whole subject and invest if deemed advisable. Our own Government is now investigating, and it should not be long before something definite ought to be known. H. E. V. D.

THE "1900" FAMILY WASHER FREE.

Greatest Invention of the Age. Labor and Expense of Washing Clothes Cut in Two.

No More Stooping, Rubbing or Boiling of Clothes.

Every Farmer Needs One.

THE "1900" BALL-BEARING FAMILY WASHER SENT FREE.

to anyone answering this advertisement, without deposit or advance payment of any kind, freight paid, on 30 days' trial. The 1900 Ball-Bearing Washer is unquestionably the greatest labor-saving machine ever invented for family use. **Entirely new principle.** It is simplicity itself. There are no wheels, paddles, rockers, cranks or complicated machinery. It revolves on **bicycle ball bearings,** making it by far the easiest running washer on the market. No strength required: a child can operate it.

No more stooping, rubbing, boiling of clothes. Hot water and soap all that is needed. It will wash **large quantities of clothes** (no matter how soiled) **perfectly clean in 6 minutes.** Impossible to injure the most delicate fabrics. Do not be prejudiced. This is entirely different from and immensely superior to all other washers.

A DAY'S WASH IN THREE HOURS.

SHERWOOD, Md., Jan. 15, 1901.
The washer I received from you is the best I ever saw. It will do all you claim for it. I can do the washing in three to four hours, where it took a colored woman a whole day to do it. We have 10 boys and three girls, and you can judge from that that we have large washings. Myself and daughter would not part with this machine for twice what it cost. We live on a farm.
MRS. LEVI H. HARRISON.

THROW OLD STYLES AWAY.

FIVE MILE, Tex., Aug. 9, 1900.
The washer just received. Tried it, and am very highly pleased with it. Four women tried the machine and all like it. It does not take a man to turn it. A farmer will save time and money by buying it, and throwing old style washers away.
MRS SARAH E. MAUVAIS.

EVERYBODY'S GARDEN.

PROFIT IN THE HOTBED.—It must be admitted that with farmers in general, and even the dwellers on village or suburban lots, the idea of utility in hotbeds usually meets with little favor, and in so far as personal acquaintance extends their use is almost unknown. Whatever the reasons assigned for this almost total neglect, it is practically certain that in general they are not well founded, and a thorough trial of the work for a season or two would in most cases sweep all the objections aside. Were we to figure the cost of the hotbed and labor necessary for its care, and offset against that the value of the products, not merely in dollars and cents, but in family comfort and convenience, the argument would be entirely on one side. This being the case, cannot more farmers and more families in general be induced to give the idea a fair trial? By reference to page 751 the hotbed products were principally radishes, lettuce, tomato and cabbage plants, which totaled $23.09. The lettuce was not all matured in the bed, but in part was transferred to the open ground. On the other hand, onions and beets not credited, were started for transplanting in the open ground, and the space occupied for both hotbed and cold frame was only 12 x 24 feet. Even this showing was not the full capacity, as not a seed was sown until April 1, and the beds were laid aside early in June. Operations might have been carried on in the same beds for half the Winter, and by judicious rotation the receipts would have been much augmented. But laying aside what might have been, the fact still remains that the hotbed may be made a substantial source of profit, and ought to be an adjunct of every farm home at least. We hope also, that the New England farm girl, and perchance many more, may find in these suggestions a stepping stone to a larger base of operations.

UTILIZING GARBAGE.—The following experiment, while perhaps not conclusive or safe to follow on all occasions, is nevertheless worthy of note. While on a visit to a neighboring city two years ago, I was not a little surprised to see a gardener allowing the city garbage to be hauled and dumped on his land. I was not favorably impressed with the idea, but decided to await results before expressing opinions. The soil was a light gravel, and as he informed me, had been nearly worthless for growing ordinary crops. Corn had been planted the Spring previous, which as to results was almost a total failure. The garbage was the regular city accumulations, from wood and coal ashes to everything conceivable, and was hauled out and dumped in piles from the large cans used for the purpose. Being near the henhouse a large flock of hens had free access to the heaps, from which in the mild weather their living was chiefly obtained. It was usually forked over and spread out as fast as hauled, but it looked to be from two to four inches deep after being spread. The effort was to distribute the ashes, of which there was a large contingent, as evenly as possible through the mass, with the idea of plowing under deeply to form a more lasting subsoil, which in that land was sadly lacking. Now as to results: In the Spring the idea of the deep plowing was fully carried out, and corn was again planted, with the result that the crop was enormous. The conditions and results as above stated are entirely authentic, but other soil conditions might give vastly different results. While not advocating the practice for others to follow, I would with my present experience feel perfectly safe, with proper precautions, to try it on almost any soil. In extensive gardening localities, where the manure supply is always a serious question, this use of garbage might to some extent help to solve the problem both for the cities and the gardeners.

J. E. MORSE.

Cow Peas Over Winter.

J. E. S., Columbus, N. J.—I have a fair stand of Crimson clover on nearly all my corn and garden ground. Have you noticed the effect of cow peas allowed to lie on top of ground all Winter and plowed down in early Spring in the succeeding crops? There does not appear to be much left of them in the Spring. If they do as much good this way I should prefer them to clover, as they can be plowed earlier and we can be more sure of a stand in dry weather. I sowed a small plot in sweet corn at last working in June and they made a thick covering for the ground, but am afraid there will not be much to be seen to plow under by Spring, although the good may be there.

ANS.—"The good is there" safe enough. We have usually left the cow peas to die down on the ground. It is true that the leaves fall, and that by Spring only a few brown vines or sticks are to be seen. We know of people who became disgusted with this Spring showing of cow peas, and declared that they never would try them again. The crop grown after these "little sticks" was so large that these people changed their mind. The most scientific method with cow peas is to plow them under early and sow rye or some other Fall and Winter crop. This can be plowed under in Spring. It is not always desirable to have a heavy crop for Spring plowing. In such cases the cow peas may be left to die down on the ground. They will surely be heard from. Or, oats may be sown in place of rye. The oats will make a heavy growth through the Fall, cover the ground and die before Spring so as to make easier plowing.

For the land's sake, use Bowker's Fertilizers. They enrich the earth.—*Adv*

A Few Hundred Dollars a Year
FOR YOUR INFLUENCE.

While I am doing the largest business in my line in the world I am not satisfied. I want to make it ten times larger even at a greatly reduced percentage of profit.

I want to sell ten times as many farms as any other half dozen real estate brokers in America.

With this end in view, I want to enlist the help of every influential farmer who wants to make a few hundred dollars a year by occasionally giving me a few tips and attending to a little easy dickering for me.

W. M. OSTRANDER.

My proposition to you is this:

If, when you hear that one man has decided to buy another man's farm, you will arrange to have the deal closed through me, I will give you one-half of my commission.

You will go to the prospective buyer and tell him that it will be a personal favor to you if he will close the deal through me.

You will tell him that, if he has not definitely promised to buy, I can probably buy at a lower price than he can. I will give him the full benefit of the reduced price. I will collect my commission from the seller and send one-half of it to you. Or I will, if you prefer, authorize you to collect your share of the commission direct from the seller.

You will tell the prospective buyer the reason why I can buy the farm for less than he can. It is because the owner will know that, if I cannot buy his farm at my price, I am in a position to hunt up plenty of other good farms which I *can* buy at my prices. And he isn't going to refuse a fair offer from me if it is definite.

Thus, by closing the deal through me, you will make something, I will make something, and your friend (the buyer) will save something.

You will readily appreciate the fact that this is a gilt-edged proposition. It involves no real work, no canvassing, no expense, and no risk of any kind, on your part.

You might make fifty or a hundred dollars, or more, by a single five minutes' talk with a friend or acquaintance, or by writing a single letter.

You are pretty sure to hear of a number of your neighbors who are going to buy farms in your locality during the coming year.

And, if you put this proposition to each one, fully and clearly, I am sure that each one will accept. I am sure that no one is going to refuse to let me save a hundred or several hundred dollars for him.

If *you* are going to buy a property of any kind, anywhere, and if you have decided upon the property, I am practically sure (for the aforementioned reasons) that I can buy it at a lower figure than you can.

In that event, if you have positively decided on a certain property which is not now listed with me, *I will give you all I can save and one-half of my commission*, if you will put me in communication with the owner and let me close the deal.

No other real estate man in America will make such a liberal offer to you.

No other real estate broker is in a position to successfully carry out such a plan.

It is the magnitude of my business, my unequalled facilities, my force of more than fifty capable assistants, and the prestige gained through many thousands of dollars' worth of judicious advertising, that enables me to operate in such a manner, and to buy at lower prices than any other individual.

If you want to buy any kind of a property, anywhere, and if you have not selected it, tell me what you want so that I can send descriptions, prices, terms, etc.

I have all sorts of desirable properties in all parts of the United States, besides a few excellent farms in Canada and investments in Mexico.

If you want to sell any kind of a property anywhere, send me a good description, including the selling price, and learn my successful plan.

If you think you will be able to coöperate with me in closing a few sales during the next few months, please write to me about it at your earliest convenience.

Do any of the following properties interest you?

W. M. OSTRANDER,
1440 North American Bldg., Philadelphia, Pa.

A Fine Farm in Delaware Co., N. Y.

Here is a genuine bargain. It contains 215 acres, 50 of which are in native timber. The remainder is good, rich soil under a high state of cultivation. The orchard contains apple, pear, cherry and plum trees. Good, convenient house, with lawn in front and four barns. All necessary outbuildings. Fine spring water; ½ mile from Northfield post office and two miles from railroad station. The price, $5,000, is less than the cost of the buildings.

39 Acres in Saratoga Co., N. Y.

This is a good rich farm situated on the east side of Saratoga Lake. The location is very desirable and the large farmhouse is used for the accommodation of Summer boarders. Great abundance of fruit. Good buildings and fences; two miles from White Sulphur Springs and six miles from Saratoga Springs. Price, $5,300.

21 Acres in Tompkins Co., N. Y.

This farm overlooks the city of Ithaca which is one mile distant. All the land is under a high state of cultivation. Good buildings; new double house; abundant fruit, and fine water; ⅛ mile to railroad station. A very desirable property. Price, $15,000.

24 Acres in Ulster Co., N. Y.

Nearly all the land is under cultivation. There are about 1,000 fruit trees of choice varieties. Good boating and fishing. About 20 minutes from the railroad station and the New York boats. This is a fine location for a large boarding house or Summer hotel. Price, $10,000.

Good Store Property in Ulster Co., N. Y.

This was built for a general store, but can be used for any kind of business. Any live man can build up a prosperous business in this location. The store building is 20x40 ft.—two floors and basement. The adjoining house is 24x24 ft.; ¼ mile from post office; two miles from railroad station. Church and school convenient. Price, $2,000.

In Hannibal, N. Y.

On this four-acre property are a comfortable dwelling, a mill with water-power of 10 to 30 h. p., and an excellent orchard of apples, pears and small fruit. The property is only 80 rods from the New York Central Railroad station, in the pleasant little village of Hannibal, Oswego Co., N. Y. Price, $3,000—easy terms. Full particulars if you will write.

An Excellent Farm in Greene Co., N. Y.

It contains 100 acres of fine farming land and is considered one of the best farms in Greene Co. Excellent buildings, nearly new, and all modern improvements. House contains 15 rooms and bath. Has hardwood floors. There are about 1,500 fruit trees—pears, apples, peaches and cherries. Good schools and store nearby. The location, in the Catskill Mountains, is especially desirable because of health, scenery and good water. Price, $15,000.

44 Acres in Oneida Co., N. Y.

This is a finely located farm near the town of Trenton. Good rich soil. Abundant fruit and shade. Attractive lawn. Convenient to schools and churches. Very desirable neighborhood. Price, $4,000.

A Bargain in Manheim, N. Y.

This comfortable and attractive cottage is situated in the center of the village of Manheim, Herkimer Co., N. Y. It contains 15 rooms and bath. Has electric lights, modern plumbing and all conveniences. Fine shade. Lot 41x115 ft. Price, $1,600—$900 down.

This is but one of more than three hundred advertisements of mine which appear in all the leading periodicals. I am advertising properties in every State in the Union. I can sell your property no matter where it is located. I have especially desirable properties in Florida and California. Write to me to-day.

A Residence in Suffern, Rock. Co., N. Y

Here is an attractive, well built residence in a pleasant locality. It contains 13 rooms and bath and has a laundry in the basement. There is a large porch on three sides. The lot has a frontage of 150 ft. and is 120 ft. deep. Ten minutes' walk from railroad station. Church and school convenient. Price, $5,500—$2,500 cash; balance, mortgage.

450 Acres in Washington Co., N. Y.

Seventy-five acres are in timber; 200 acres can be cultivated. Orchard contains about 75 trees. House, two barns, ice house, granary and other buildings; two miles from post office and railroad station. Price, $8,000.

A Fine Residence in Cortland, N. Y.

This house was built entirely by day work and is most carefully and substantially erected. The interior is finished in cherry, ash, butternut and curly maple. Handsomely carved mantels. Plate glass and stained glass windows. Steam heat and all conveniences. Contains 14 rooms and bath. Large stable. Abundant shade and fruit trees. Lot 140x278 ft. Price, $15,000—$9,000 cash.

Two Acres in Patchogue, N. Y.

This property has a frontage of 120 ft. on Swan Creek, and is admirably adapted to poultry raising. The land is especially good for truck and vegetables of all kinds for which there is a ready market. Patchogue is about 1½ hours from New York on the Long Island R. R. Price, $1,100—the value of the ground alone

W. M. OSTRANDER,
1440 North American Building, Philadelphia.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

THE VALUE OF VARIETIES.—There is a well-founded objection to the indiscriminate introduction of new varieties of economical and ornamental plants. Unless the newcomer is distinctly superior in some important particular to well-known kinds, there is little excuse for unloading it on the public, though the temptation to disseminate a new plant showing local excellence is always strong. As plant cultivation becomes more specialized and intensive, greater discrimination is needed to find varieties having the desired qualities of product, and in addition resistant to parasites and diseases such as appear to be favored by high cultivation. An important work of the near future will be the breeding of such resistant varieties by the selection of seeds or propagating stock from individuals appearing to resist the invasion most successfully, and continuing the selection through generations enough to render the new strains sufficiently immune for practical cultivation, and to create summarily new resistant varieties by hybridization whenever such result may be possible. While waiting for these vigorous new kinds, earnest investigators are looking over our stock on hand, and find here and there a standard or obscure variety already possessing, from some peculiarity of constitution, the needed resistant qualities. Thus the Ives grape is successfully grown where other kinds are destroyed by rot, the Argenteuil and Palmetto asparagus resist the rust to a considerable degree and so on. The discovery of a peach immune to "yellows" is announced in a bulletin of the Bussey Institution of Harvard University and reports of a cow pea, the only one of 75 varieties, entirely resistant to the "eel worm," so common in southern soils, which kills the plants by forming knots on the roots, comes from the Agricultural Department at Washington. The peach is known as White Magdalene, and has been grown for nearly 160 years in the family of Edmund Hersey, Hingham, Mass., the original tree having been raised from a seed brought from southern Europe about 1740. It is of medium size, white-fleshed, freestone and good flavor, and remains essentially the same after repeated generations have been raised from seeds, withstanding all the vicissitudes of the harsh New England climate. The seeds germinate as readily as in the early days, and always reproduce the parent, it not appearing to cross with any other near-by variety. The wood ripens well, and is rarely killed by cold weather. No tree has ever shown the slightest indication of yellows, though some have grown so near other peach trees that have died of the disease that the branches of the two have intertwined. Peach yellows is so prevalent in the vicinity that trees of other varieties, grown both from seeds and buds, live but a short time. The White Magdalene does not appear to be widely disseminated, though it is spoken of in Downing as a foreign variety of fine quality, ripening by the middle of August.

The resistant cow pea is named the Little Iron, and is apparently too hard a customer for the minute and almost invisible worms causing the root-knot disease. The Department's experiments with certain strains of the Little Iron cow pea have been so satisfactory that an extensive distribution of the seed for widespread trials will be made as soon as a sufficient quantity can be procured. Root-knot galls infest a wide variety of useful plants, such as roses, violets and peaches, as well as cow peas, though different species of "eel worms" may be concerned in the injury. At any rate it is comforting to hope for a resistant cow pea to be used as a cover crop in peach orchards, if for no other purpose, though the cow pea root-knot has hitherto been quite limited to southern soils. Eel worms and root-knots must not be confounded with the nitrogenous nodules and their accompanying bacteria normally found on the roots of healthy cow peas. The latter is a friendly partnership, of the greatest value to the cow-pea plant and to the cultivator by determining the fixation of nitrogen from the air, while the former is a dangerous and often fatal disease.

THE CAUSE OF PEACH YELLOWS.—The various theories as to the cause of the obstinate and fatal disease of yellows are thoroughly overhauled in the Bussey Institution bulletin by Prof. E. W. Morse. There is not yet sufficient evidence to fasten the distinctive process on microbes, unsuitable conditions of soil or climate, or injuries from insects or of mechanical origin. The only remaining factor seems to be infection by a poisonous enzym conveyed to the seed germs through pollen from diseased trees, or more directly by budding, grafting or possibly pruning with tools used on affected trees. The strange thing is that few young trees show any signs of the disease, else they would not be transplanted to orchards, but after attaining bearing size, and especially after producing a crop or two of fruit, they sicken and die. The explanation is that the enzym, which is a secretion or alteration of the protoplasm of the living plant cells, lies practically dormant, or at least is unable to provoke its characteristic alteration of nutrition, ending in the phenomenon known as yellows, until the vigorous youthful growth has been checked by maturity or cropping. The reason why a potent variety like the White Magdalene is immune to the yellows contagion may be sought in the thorough acclimatization it has obtained by being grown for successive generations in one place before the yellows appeared and to its harmonious internal organization, enabling it to resist chance infections from outside sources. Prof. Morse thinks that the use of seeds or pits from southern localities where the life struggle against climate is not so severe is an important factor in the progress of the disease in the North.

THE CLOSE OF THE GARDENING YEAR.—It remained for the night of November 10 to bring a killing frost, or rather light freeze to the Rural Grounds. All flowers except a few hardy Chrysanthemums in a particularly well-sheltered place were blasted, and the most brilliant late Autumn display we have yet seen quickly ended. All crops, including late celery, are safely housed, and only a little grading, covering and tree planting remains to wind up the season's operations. Instead of raking up and burning all rubbish and leaves, as generally advised, we are covering exposed slopes not in grass or Crimson clover to protect the soil from Winter rains. We have allowed few, if any, weeds to seed, and are convinced that the soil is benefited by a light covering during Winter, even if only of the past Summer's dead growth. Such trash will greatly diminish in bulk and weight by next Spring and be easily removed.

W. V. F.

SENSIBLE FRUIT NOTES.

What I say and think about the Stringfellow method of planting trees is this: While it may be a success or partially so under some conditions, the principle is radically wrong for general application. If it would succeed anywhere I should say it would on rough, stony hilly soil. If we should plant trees here on our level sandy and loamy soils with little or no cultivation we would have a sorry looking orchard. I went several years ago to Berks Co., Pa., to Christopher Shearer, to see the Globe peach. He had the finest show of peaches anyone ever saw, growing on the hillsides, with practically no cultivation, and an enthusiast would jump at the conclusion that peaches did not need cultivation, but a very long practical experience has taught me differently, and should you succeed with the Stringfellow method it would by no means be conclusive that the principle was right for general application.

Wet soil is not fit to plant any kind of a fruit tree, and the stone fruits least of all. I would not advise one to plant quinces on it if at all wet; if it is not fit to grow potatoes it is not fit for quinces. The prevalent idea that the quince needs a moist or wet soil is an erroneous one, and I have seen many failures from the practice. Tree agents advise people to plant quince trees where it is too wet for general purposes, and they invariably fail. I have grown more or less quinces for several years, and my best success with fruit and the trees has been on good sandy loam.

New Jersey. CHAS. BLACK.

A Superior Grape.

Several years ago Prof. Munson, of Texas, sent me a grapevine, the name of which I have lost. I planted it at a place very much exposed to all kinds of weather. Last year it bore a few bunches. I made a bottle of wine from it. Judging from the small quantity of wine made, I think it will make a first-class claret, superior to Virginia or Missouri Riesling. This vine, which bore about 18 pounds of grapes this year, grows in close proximity to about 1,500 Concord vines, which owing to the wet Spring and the inability to spray them, were all spoiled by the black rot; but on this vine not a berry is affected. The wood and leaves are perfectly healthy. I may add, this vine grows at an elevation of about 925 feet above sea level at the foot of the Alleghany Mountains; has never received the least Winter protection, and seems in our climate perfectly hardy.

Hollidaysburg, Pa. F. J.

The grape is either a Carman or an America, or possibly R. W. Munson. If the variety has much very dark violet red juice, it is America. If it has white juice, or only rosy red when fermented on the skins, it is Carman, or possibly, R. W. Munson. Neither of these is troubled with black rot, and all of them make good wine. America, very dark violet juice, R. W. Munson, clear claret red, Carman, white or pale rose. All excellent for market.

T. V. MUNSON.

GATHERING LEAVES.—Those who live near forests have a supply of excellent bedding at hand; and, unless rains are too frequent, the leaves may be gathered to advantage and stored for Winter use. They are bulky and difficult to handle. Readers give the following methods of doing this work, which have been found satisfactory. Of course, the leaves must first be raked into piles. Then take large bran sacks, and, while one holds the sack, another can stuff in the leaves. By treading them down once or twice while filling a surprising amount can be put in. The sacks need not be tied, and can be loaded on to a hay rigging. If one has a wagon with a large box, like those used in hauling charcoal, and can drive close to the piles of leaves, they may be thrown in quickly with a barley fork, or a special rack can be made for holding them on a hay rigging. Where it is not convenient to get close to them with the wagon, a four-bushel basket works well (this is also handy to have around the barn for handling chaff or other light stuff); or a sheet may be made of coarse sacks, which, when the corners are brought together, will hold a good many leaves.

BEFORE BUYING A NEW HARNESS write for our 200 Page Illustrated Catalogue giving full description and prices of all kinds of single and double harness and save 25 per cent.
King Harness Co. 510 Church St., Owego, N.Y.

WELL DRILLING Machines
Over 70 sizes and styles, for drilling either deep or shallow wells in any kind of soil or rock. Mounted on wheels or on sills. With engines or horse powers. Strong, simple and durable. Any mechanic can operate them easily. Send for catalog.
WILLIAMS BROS., Ithaca, N. Y.

BRAND NEW STEEL ROOFING

Bought at Receivers' Sale. Sheets either flat, corrugated or "V" crimped. No tools except a hatchet or hammer is needed to lay the roofing. We furnish free with each order enough paint to cover and nails to lay. Price per square, $1.75
A square means 100 square ft. Write for Free Catalogue No. 57 on General Merchandise. Chicago House Wrecking Co., West 35th and Iron Sts., Chicago, Ill.

FARM TELEPHONES
How to put them up—what they cost—why they save you money—all information free. Write for it to J. Andrae & Sons, 208 W. Water St., Milwaukee, Wis

ICE PLOWS $12 Also Ice Tools. Write for discounts. H. PRAY, No. Clove, N.Y.

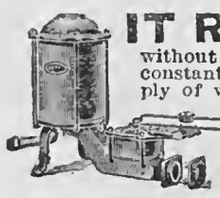
ICE CUTTING is quickly done with DORSCH Double-Row STEEL PLOW. Cuts faster, easier, and with less expense than any other plow made; cuts any size cake and depth; marks and cuts at the same time. Pays for itself in less than two days. For Eastern States we ship from Albany, N.Y. Get catalogue and prices.

Made in three sizes.
John Dorsch & Sons 226 Wells St. Milwaukee, Wis.

On Rough Ground
use PAGE Fence. It fits any surface perfectly.
PAGE WOVEN WIRE FENCE CO., ADRIAN, MICH.

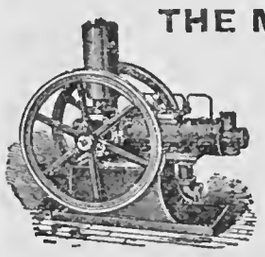
WIRE FENCE AT WHOLESALE.
Also Coiled spring, plain and Barb wire. Send for Cat. and prices. W. H. Mason & Co., Box 67, Leesburg, O.

Cider Machinery.—Send for catalogue to Boomer & Boschert Press Co., 118 West Water St., Syracuse, N.Y.



IT RUNS ITSELF without expense or attention, giving a constant supply of water. RIFE Hydraulic Engine pumps water any height. Sold on 30 days trial. Send for catalogue.
RIFE ENGINE COMPANY, 122 Liberty St., NEW YORK.

CHARTER Gasoline Engine
USED Any Place By Any One For Any Purpose
Stationaries, Portables, Engines and Pumps, Hoisters
Send for Illustrated Catalogue and Testimonials. State your Power Needs.
Charter Gas Engine Co., Box 26, Sterling, Ill.

THE MIETZ & WEISS Kerosene Engines


Cheapest and Safest Power Known. For pumping and electric lighting, grinding corn, separating cream, sawing wood, and all power purposes. Send for Catalog.
A. MIETZ, 128 Mott Street, New York.

LAND DRAIN TILE
(Car-loads or less).
Sizes, 2, 2½, 3, 4, 5 and 6-inch.
WILLIAM T. LEGGETT & CO.
1025 Liberty Avenue, Pittsburgh, Pa.

HOPE FARM NOTES

FAIR EXCHANGES.—The miller offers to take my rye straw at $15 per ton in exchange for bran at $20. By delivering the straw in small lots to people who keep one or two horses I could get more for it, but the hauling would make about the difference. Figuring on this proposed exchange gives a pretty lesson in fertility and feeding values. Here are the figures to start with:

FEEDING VALUES.

POUNDS IN ONE TON.

	Protein.	Carbohydrates.	Fat.
Wheat bran.....	200	970	62
Rye straw.....	16	730	8
Corn	168	1,212	96

FERTILIZING VALUES.

POUNDS IN ONE TON.

	Nitrogen.	Potash.	Phosphoric Acid.
Wheat bran.....	45	31	54
Rye straw.....	8	18	5
Corn	32	8	12

In figuring the feeding values I have given only the parts that are digestible by the average animal. For example, in a ton of rye straw there are really 60 pounds of protein, but the straw is so tough and hard that barely 16 pounds are digestible. Even if you could get an animal to eat a ton of the straw it would be too much like the man who drank a bucket of water to get one drink of whisky which some one had poured into it. I ought to get more than 1,500 pounds of bran for a ton of the straw, but suppose I get only that much I receive nearly 10 pounds of protein and six of fat for each one I send away. I don't bother about the carbohydrates, because the corn fodder furnishes plenty of them. I also get over four pounds of nitrogen, nearly nine of phosphoric acid and 1½ of potash for each pound I sell in the rye straw. From both points of view it will pay to make the change.

THE OTHER MAN!—But is not some one cheated in the bargain? Where can you find people who are foolish enough to make such a one-sided deal? The men who buy this straw are not farmers at all. They have small stable room, and the manure pile is a nuisance. They want rye straw because it is hard and tough, and does not break up readily. With care it can be used again and again as bedding, while the life of oat or wheat straw would be barely half as long. If they used these straws the manure pile would be twice as big and they would need twice the storage room. Nature gave the rye plant a tough, hard hide, and it holds the few pounds of fertility that it takes from the soil as a miser grips his few dollars! I never realized how tough rye straw is until my neighbor pulled down an old stone house in order to build a newer dwelling. That house was at least 150 years old. When it was built no cement or mortar was used—but clay and straw were packed between the stones! I got specimens of this clay in which the straw is still straight and tough! That makes me more and more inclined to get rye straw off the premises. It is too tough, and does not decay readily in the soil. I can't wait a century for humus to decay! If it will hold the house together for 150 years it will hold the mortgage on to the farm if you depend on it for manure! Plowing under rye straw is too much like the man who hid his talent in the ground. You will find it where you put it, instead of finding it in other crops. For every reason, then, it pays us to sell rye straw and buy grain.

SELLING CORN.—Why not sell corn too? I can get at least $26 a ton for shelled corn, and this would buy 2,600 pounds of bran. By doing this I would get two pounds of protein and less than one pound each of carbohydrate and fat in exchange for one pound of each in the corn. In fertility I would receive a little less than two pounds of nitrogen, five of potash and nearly six of phosphoric acid for each pound in the corn! The 2,600 pounds of bran will make a better ration fed with the stalks that produce this corn than the yellow grain would! There seems to be sound argument in favor of the change, but I do not expect to make it. Say what you will about corn, there is no grain so convenient to feed and so generally useful for all stock. When you feed it you know just what you are doing, because it does not vary. When you buy bran or other mill feed you may or you may not have what you order. I may exchange some corn for whole wheat, but the business of parting with this standard grain is very different from that of the rye straw. I claim that it will seldom pay an eastern farmer to sell corn. I would rather buy linseed and bran, and feed them with my corn to pigs. I feel sure that with roots, rape or clover to help out, the pigs will pay more for the corn than the miller will!

"SCROOGE DOWN."—Last week I took the Sprout and the Bud up into Orange County, N. Y., to see O. W. Mapes, the hen man. These girls mean to start right with the Hope Farm poultry. I suppose Mr. Mapes has owned 50,000 different hens during the past 12 years, and a feather's weight of sound advice from him is worth a pound of talk from some "know-it-all." I will tell you about the hens later, but here is the point I want to make this time. On the train coming home the conductor stopped and gazed at the Bud. When a man has been told that his daughter resembles him he appreciates such attention—until he learns what it is all about.

"How old is that child?"

I began to see what was up, but there was no backing out.

"She is seven years old!"

"Then she will have to pay half fare!"

There was no getting around it. Poor little Bud—your days of free passage are over! You are a citizen now in the eyes of the corporations! I paid the fare, and as my purse lightened my years seemed to grow heavy. There flashed into my mind a little incident that I had not recalled before in 30 years. Strange, how these little things flash out of the past.

When I was a little boy I was "brought up" by an old couple who had some marked ideas of economy. Once, when I was nearly 10 years old, I rode with the old lady on a railroad train. As the conductor came in sight this command was sternly whispered to me:

"Scrooge down! Scrooge down! So he will think you are too small to pay fare!"

I ought to have been a hero and refused to "scrooge." In fact I suppose I should have stretched out an inch, but I was a cowed and homesick little boy, and I am ashamed to say that I did my best to shed five years of growth! The conductor came and eyed me for full half a minute. A sharp elbow nudged my ribs. I knew that meant another "scrooge" and I felt my little spine close up like a telescope. I saved the fare, but I lost self respect and courage which 20 years of pounding at the world hardly brought back. God help the children who are taught to "scrooge" and deny the truth about themselves. The world seems to have its fair share of people who, in order to save a few dollars, will obey the order to "scrooge down" and try to pass themselves with a spurious ticket. Some of these people I blame—others I do not, because I know what early example and "bringing up" will do for people. I am aware that I cut a poor figure myself in this episode, so it is not for me to criticise others. Had the Madame been in my place I think she would have tried to lengthen out an inch or two and given the old lady a piece of her mind to make the size more evident. There will be no "scrooging" around her!

QUESTIONS.—What roots do you raise for Winter feeding?

Yellow turnips.

Are not sugar beets better?

I am told so, but have never grown many.

Why not?

The chief reason is that the yellow turnips, with us, comes as a second crop. We can sow it after early peas, sweet corn or even early potatoes. The sugar beet requires a longer season, more care and is I think harder to grow. We feed most of these roots to the brood sows.

What are these sows eating now?

They have cabbage and flat turnips, with a fair feed of dried brewer's grains and a few ears each day of nubbin corn. Next month we shall begin feeding linseed meal with cooked turnips.

Why do you cook the turnips?

Chiefly because it gives a warm breakfast. The turnips would do well fed raw, but when cooked, a strong and healthful soup may be made by adding bones or small pieces of lean meat.

Do you not boil the small potatoes?

Yes, but this Fall they are largely fed to the hens. They are boiled and mashed and mixed with dried brewer's grains or bran, fed in the morning.

Are you not afraid to feed corn to brood sows?

No—not in small amounts when the sows have green feed like cabbage or rape. One trouble with corn for brood sows is the fact that it contains so little of the ash or bone-forming elements. To offset this we keep constantly before the sows a box of wood ashes with which small quantities of salt and sulphur are mixed.

Are you setting any trees this Fall?

About 150 peach and 25 quince for the purpose of testing the Stringfellow method of Fall planting.

Are you setting small peach trees?

No, the largest we can get. I am now satisfied that the little June buds are too small for our use.

Do you advise your friends to set trees on this Stringfellow plan?

No—nor my enemies either! It will make one of the most interesting experiments one can try. I shall plant more trees next year, but I do not yet know enough about it to give sound advice.

How is your Fall seeding of grass and grain?

Good. The Fall has been very dry, but our heavy soil holds moisture well and the crops have made a good start.

Does the loss of your potato crop discourage you?

Yes and no! I feel the loss of the crop sadly, but I am now well convinced that our hills are not well adapted to potato growing. Some of the lower fields may answer, but as a whole the farm cannot compete with many others in potatoes. I am sorry, for the potato crop suits us well, but I feel sure that we can find others that will prove more profitable and just as pleasant.

How are Cow-horn turnips?

Still thrifty. They look as though they might live till the middle of December. The Crimson clover among them is thick and green. I call it a good mixture for a cover crop.

H. W. C.

THE ESQUIMO

The Esquimo eats blubber. The lumbermen eat pork. These people are constantly exposed to cold and physical strain. Experience has taught them that fatty foods give warmth and nourishment.

For those who have cold and thin bodies, or are threatened with consumption or any wasting disease, there is no fat in so digestible and palatable a form as Scott's Emulsion. Physicians prescribe it.

We'll send you a little to try, if you like.
SCOTT & BOWNE, 409 Pearl street, New York.

Write and See.

Don't Let Prejudice Keep You From Getting Well.

NO MONEY IS WANTED.

Simply write a postal for the book that applies to your case. See what I have to say. You can't know too much about ways to get well.

My way is not less effective because I tell you about it. There are millions of cases which nothing else can cure. How can I reach them save by advertising?

I will send with the book also an order on your druggist for six bottles Dr. Shoop's Restorative. I will tell him to let you test it for a month at my risk. If it cures you, the cost will be $5.50. If it fails, I will pay him myself.

The book will tell you how my Restorative strengthens the inside nerves. It brings back the power that operates the vital organs. My book will prove that no other way can make those organs strong.

No matter what your doubts. Remember that my method is unknown to you, while I spent a lifetime on it. Remember that only the cured need pay. Won't you write a postal to learn what treatment makes such an offer possible?

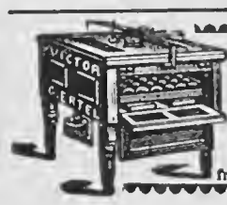
Simply state which book you want, and address Dr. Shoop, Box 570, Racine, Wis.

Book No. 1 on Dyspepsia,
Book No. 2 on the Heart,
Book No. 3 on the Kidneys,
Book No. 4 for Women,
Book No. 5 for men (sealed),
Book No. 6 on Rheumatism.

Mild cases, not chronic, are often cured by one or two bottles. At all druggists.

50 EGG BANTAM 30 DAYS TRIAL. 50 chicks from 50 eggs, or don't keep it. 2c for No. 23 catalog. $5. BUCKEYE INCUBATOR CO., SPRINGFIELD, OHIO.

Incubators From $6.00 Up.
Brooders From $4.00 Up.
Fully Warranted. Free Catalogue.
L. A. BANTA, Ligonier, Ind.



VICTOR INCUBATORS
The simplest, most durable, cheapest first-class hatcher. Money back if not as represented. Circular free; catalogue 6c. We pay the freight. GEO. ERTEL CO. Quincy, Ill.

200-Egg Incubator for $12.80
Perfect in construction and action. Hatches every fertile egg. Write for catalogue to-day.
GEO. H. STAHL, Quincy, Ill.

Des Moines Inc. Co. Bx 90, Des Moines, Ia. or Bx 90, Buffalo, N.Y.

GOOD RESULTS.
To be absolutely sure about it use the RELIABLE INCUBATORS & BROODERS
If the eggs are right, you can't make a mistake. Just follow instructions—the Reliable will do the rest. OUR 20TH CENTURY POULTRY BOOK, mailed for 10c, tells all about it and other things you should know. We have 115 yards of thoroughbred poultry. RELIABLE INCB. & BRDR. CO., Box B- 101 Quincy, Ill.

"GET A DANDY"
the fastest cutting bone cutter made, and double your egg yield. Sold direct on 30 days trial. $5 up. Catalogue free.
Stratton Mfg. Co., Box 13, Erie, Pa.

The Egg Question Solved
by the HUMPHREY Green Bone & Vegetable CUTTER
Guaranteed to cut more bone, easier and quicker than any other or your money back. Only open hopper machine. Catlg. and Egg Record free.
HUMPHREY & SONS, Box 39, Joliet, Ills.
EASTERN AGENTS, JOSEPH BRECK & SONS, Boston. JOHNSON & STOKES, Philadelphia. GRIFFITH & TURNER CO., Baltimore.

Don't Let Hens Loaf.
They'll work overtime on raw cut bone. A worker lays, a layer pays. You can loaf half the time and still cut more bone with
Mann's Bone Cutter 1902 Model
than with any other type. It cuts all shin bones, meat and gristle. Wastes nothing. Never clogs.
10 DAYS FREE TRIAL—no money in advance. Free Cat'lg explains.
F. W. MANN CO., Box 15, Milford, Mass.

LATEST (Newton's Patent.)
DEHORNER
IMPROVED
Every Dehorner Guaranteed
THOUSANDS IN USE.
Ask your hardware dealer for them or write
M. H. BROWN MFG. CO., • • DECATUR, ILL.

KEYSTONE DEHORNER
Makes dehorning easy and painless. Cuts on four sides at once. It never bruises nor crushes. Send for circulars.
Endorsed by colleges and experts. Highest award World's Fair. Orders with cash shipped from Chicago if desired.
M. T. PHILLIPS, Pomeroy, Pa., (Successor to A.C. BROSIUS).

The Rural New-Yorker

THE BUSINESS FARMER'S PAPER.

A National Weekly Journal for Country and Suburban Homes.

Established 1850.

HERBERT W. COLLINGWOOD, Editor.
DR. WALTER VAN FLEET, H. E. VAN DEMAN, MRS. E. T. ROYLE, } Associates.
JOHN J. DILLON, Business Manager.

SUBSCRIPTION: ONE DOLLAR A YEAR.

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs.

"A SQUARE DEAL."

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

Name and address of sender, and what the remittance is for, should appear in every letter.
Remittances may be made in money order, express order, personal check or bank draft.

THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, NOVEMBER 30, 1901.

ON page 747 a Connecticut farmer's wife gave some good advice to farm girls about poultry keeping. Her figures were attractive, and letters calling for details began to pour in upon her. She could not begin to answer all, and so she has written the whole thing out in a strong article for THE R. N.-Y. We guarantee a treat when it is printed.

*

THE meeting of the New York State Dairymen's Association at Olean, on December 11-12, will be a good one. We have heard many hard words thrown at the scrub cow and the filthy milk can. It is well to make dents and scars, not on cow and can, but on the men who are responsible for adding scrub to the cow and not giving it to the can. A bigger and blacker target than either looms up this year—oleo. The bull's eye on this target is painted on the back of the chairman of the House Agricultural Committee. Let there be no compromise with oleo at Olean.

*

THE prize contest for photographs showing helpful devices or scenes in women's work will close on December 1. Few pictures have been received thus far, but these are of a high order. There is still a good chance to win a prize. Possibly some woman with a camera has a husband or even a hired man who never permits the wood box to be without its fill of dry wood and who always wipes his feet on the mat. He would certainly be classed as a prize-taking household economy. Long years of married life may have convinced the farmer's wife that he will never be hung for his beauty, but none of us wants him hung, and in this contest the useful wins.

*

THERE is a little flurry of excitement in New York City just now over the proposed plan of permitting rumshops to keep open in the afternoon and evening of Sunday. It is not necessary for THE R. N.-Y. to give its opinion regarding Sunday saloons. Certain eminent "thinkers" and drinkers (including some clergymen) favor the scheme, but it is not likely to succeed. As one man sadly remarked last week: "The farmers up the State will kill a Sunday-liquor bill in the Legislature!" He was probably right in regard to that, but he was wrong when he went on to say this: "The farmers have no business to say what we shall do in this city! They have never done anything for us!" The farmers have a vital interest in what is done in this city. They have meat, fruit, fiber, grain and other food to sell. Take milk for example. There should be twice as much sold here as is now consumed, and even then thousands would be obliged to go without it. The one thing that does more than all others to prevent the sale of milk is the sale of beer and other liquors. Money cannot be spent for liquor and also for bread, meat, fruit or clothing. The New York saloon is as much a market competitor for the New York farm as the foreign factory is for the shop where American goods are made. The farmer has a perfect right to object to any increase of competition. He would be a poor stick if he did not. But what has the farmer ever done for the city? We may answer this question by asking another. What would the city be without the farm and the farmer? Let the farmers of the country decide that for one year they will raise only enough to feed and clothe their own families, and grass would grow in Broadway so thick that you could cut it for hay. Why? Because there would be nothing left for city people to *handle* and make over. All that the workers in this great city do is to manipulate and change the things which originally came out of the soil. What have the farmers done for New York? Why, without them, the city, with all its wealth, would not be possible. You might as well ask what the heart in a man's body has ever done for the tongue and hand which receive the credit for the man's work.

*

THE time is close at hand when the farmer must once more *vote with the postage stamp*. How do you use the postage stamp as a ballot? You write a fair, respectful letter to your Congressman, Senator or State legislator, telling him in plain terms what you would like to have him do. The postage stamp carries it to him and if he pays no heed you send him another, and keep at him until he responds. When Congress adjourned many of the Senators looked like the figure which we printed last Spring, for they have been well plastered with stamps of protest against oleo. These stamps stuck to them well, and reminded them of their duty, but during their vacation they have been able to scrape most of these stamps off. Now is the time to begin to stick them on again. *Vote with the postage stamp.* Let no dodger escape.

*

IN a recent test case the California Supreme Court decided that a member of the Cured Fruit Association who sold his prunes to an outsider was liable to the Association for only the two per cent of the sale price mentioned in the contract; and that no penalty other than the payment of this two per cent could be inflicted upon him for disposing of his prunes elsewhere. The controversy arose out of dissatisfaction with the prices obtained by the Association. This decision upsets its calculations, and will render a different form of contract necessary in order to prevent members from dealing with outside parties. Of course the most binding contract is necessary to hold an organization of this sort together, though members naturally hesitate to put themselves so completely in the power of a board of directors.

*

THERE is a great and real need of fractional currency. Any man who has ever done business by mail with country people knows what an annoyance it is to receive postage stamps in payment of small bills. People send these stamps because they have no other way to send small sums of money without paying an extra price for doing so. A good proportion of the people who live in the country are a long distance from money order or express office. It would cost more than the small amount of money involved to obtain a postal note or an express money order. As a result the desired small order is either not sent or postage stamps are put into the letter. These frequently reach their destination stuck fast to the paper. With a fair amount of fractional currency in circulation we are confident that these small mail orders would be quickly doubled. Why have the people been deprived for so many years of this useful and necessary money? The only answer thus far given is the fact that the great express companies oppose it, because it would take much small money order business away from them! What an argument! Is this country to be run in the interests of a few big express companies, or for the benefit of a great many people outside these powerful corporations?

*

WE have lately had further tangible evidence of the good work being done by the officials of our National Department of Agriculture. In years gone by we have seen the introduction of the sorghum cane; the best of all oranges, the Washington Navel; and more recently the Australian ladybird beetle, that has been the salvation of the Citrus fruit industry in California. We have scarcely done reading of the introduction of the fig insect, that has made fig culture of the highest type an assured success in the same State, and perhaps elsewhere. And now, we have within less than a week's time received, through the efforts of the students of nature and science at Washington, under the encouraging leadership of Secretary James Wilson, three more most important friends of our rural industries. We have a dread enemy to our enemy, the San José scale, ready to do battle for us. We have a parasite of the Olive and Oleander scale and one of the Asparagus beetle and Grain plant-louse. The three latter, it is true, have not had time to prove their friendship, but we have good reasons for believing that they will do it in due time. We, as farmers and fruit growers should lay before our Members of Congress the necessity and wisdom of upholding the hands of those who are laboring in the Department of Agriculture. There is a plan to erect a new building in which to work at a cost of over $2,000,000, and the appropriation for it should be made without fail. This is less than some of our warships have cost, and there is no doubt of the comparative benefits being in favor of the more peaceful use of the money.

*

REPORTS come from various parts of New York State of a so-called "Farmer's Company" which is fishing for agricultural suckers with a most alluring bait. Promoters go about rural districts pretending to sell shares in a mammouth coöperative concern which is to control pretty much all the farm produce which is raised in this country. They offer 12 per cent interest on the investment, high prices for all the farmer has to sell, and low prices for all he buys, with no middleman's profits. They offer these shares at $50 each, and we are told that $60,000 worth were subscribed for in Greene County alone. Of course no reader of THE R. N.-Y. will touch one of these shares any more than he would touch a creamery shark, a buzz saw or a wild cat. We are informed that this concern is the same Buffalo seed company which we exposed last year. We printed their grain-growing contract, and showed the folly of signing any such document. We now repeat the warning, and urge all readers to refuse to sign petitions or requests for shares. Here is a part of the bait on the hooks of this company:

> Parties signing the petition will be termed charter members and will receive their shares at par value. After the petition is closed, parties desiring shares will have to pay the market price for the same, and it is calculated that it will never be less than twice their par value, as the dividend has never been less than three per cent quarterly, equaling an annual dividend of 12 per cent, and this amount, of course, makes a good investment on shares at twice their par value.

Let a farmer stop for a moment and think how silly it is to say that the coöperative sale of the products of his neighborhood will bring about any such result. If it were possible a good Grange or a live creamery association would accomplish the work for less than half the cost. As a specimen of pure, unadulterated "nerve," the following is entitled to the blue ribbon:

> This is a National corporation of farmers, by farmers and for farmers. There is no need of incurring the expense or necessity for any imaginary assistance which commercial agencies might think they could render by a rating. There would be as much sense for a large railroad corporation having each of its depots rated, or for a rating on the Post-office Department.

"Imaginary assistance" is good. We are asked if those who have subscribed to these shares can be forced to pay for them. We do not think so, and our advice would be to refuse payment after giving fair notice that you desire to withdraw. We have watched and fought these schemes for years, and we are convinced that while a man loses his reputation for hard sense by going into one of them, there is no reason why he should lose his hard-earned dollars also.

*

BREVITIES.

LIFE'S target—A high ideal!

IT does us good to see a bully cowed.

THE rooster sends his invoice through his bill.

IT'S a good thing to sit down on the sitting habit!

ONE way to dry up a cow is to dry up her pasture.

THE way to empty your character and purse is to get full.

Too many fat men develop a streak of leaning against the fence!

A KICKING mule may be described as a practitioner of the heeling art.

THE man who admits that he has much to learn is usually a good teacher.

SHELLING corn with a feed cutter is a novelty, as described in a poultry note on page 815.

OUR good friend Mr. Corn Fodder is keeping the wolf from many a stable door this Winter.

NOW, then, eastern farmer, with your smaller farm and field, how near can you come to matching those western corn figures?

THE farmers won a victory in that little milk war in Connecticut—page 809. That's what you get by hanging together.

THE plan mentioned on page 815 of running ear corn through a cutter before feeding to hens is a good one. We find that our hens can easily pick the kernels from the small ears.

THESE useful box measures may be made at home. Of course the figures given are for inside dimensions. For one bushel the box should be 24x11.2x8 inches; and boxes 12x 11.2x8, and 8x8x8.25 inches contain half a bushel and a peck respectively.

SPEAKING of the cost of raising corn, a reader in Indiana writes: "In regard to corn raising on prairie land, it is likely some of the renters near here, who pay 25 bushels per acre rent, and are now husking 18 bushels per acre, could give more pointers than I could."

Events of the Week

DOMESTIC.—Five cases of lockjaw, which proved fatal, occurred at Camden, N. J., up to November 18, believed to be the result of vaccination. . . . . In a cave-in at Oronogo, Mo., November 13, the entire plant of the Aurora Mining Company, one of the greatest zinc producers in the district, was swallowed up. No lives were lost. The plant comprised a hundred ton mill, office building and engine house, all of which were engulfed, together with six gravel cars and an immense tailing pile. On entering the ground a short time before the cave-in occurred workmen heard the timbers cracking, and signaled to be drawn up. The last man had reached the surface only a few minutes before the timbers collapsed, the earth yielded, and with a crash the whole plant sank into the abyss. Further cave-ins are feared, and work in that vicinity has been suspended. It is impossible to estimate the damage. . . . . A theater at Grand Rapids, Mich., was destroyed by fire November 13; one man killed and loss of $100,000. . . . . A fire in the business section of Clevelaud, O., November 12, caused a loss of $350,000. . . . . A fire in a varnish factory at Boston, Mass., November 12, resulted in damage reaching $150,000. . . . . November 12-14 a severe blizzard prevailed through the Mohawk Valley in northern New York; there was a heavy snowfall. . . . . In furtherance of the Government proceedings against Oberlin M. Carter, Attorney Stone, representing the convicted army officer, turned over $60,000 in railroad bonds, a note for $11,000 and $700 in cash. This makes the total amount received to date about $400,000. Another portion still to be transferred will bring the total to almost $500,000. . . . . November 12 a big office building was destroyed by fire in Cleveland, O.; one woman killed, six persons injured; loss $500,000. . . . . Fire, quickly followed by an explosion, in the Baby mine, at Pocahontas, Va., November 14, resulted in the loss of several lives. Five bodies have been recovered, 10 more are supposed to be in the mine, while 25 of the rescued were severely burned. Most of the victims had entered the mine to fight the flames. . . . . Defalcations amounting to $60,000 have been discovered in the Williamsburg Savings Bank, New York. The money is said to have been lost in speculation and was obtained by collusion between the paying and receiving tellers. One of them is now dead and the other has confessed. . . . . Full reports from Richfield, Sevier County, Utah, state that the damage to property in that county from the earthquake of November 14 will amount to almost $100,000. Scarcely a building escaped damage of some kind. The Mormon Tabernacle at Richfield was damaged to the extent of $2,000. In many parts of the country landslides have occurred, blocking railroads, changing the course of streams and causing general disorder. . . . . A dense fog was responsible for numerous accidents and collisions in Chicago November 20. In a collision between two Metropolitan Elevated trains one person was killed and 12 injured. In another collision a conductor was killed while trying to signal an approaching train. . . . . The Hardwick bill, providing for the disfranchisement of the negro, was killed in the Georgia House of Representatives November 19, by a vote of 113 to 17. . . . . At Vincennes, Ind., November 19, 300 union miners marched to the shaft of the Protest Hill Coal Mine Company where non-union miners are employed, and closed the shaft. They destroyed property, assaulted a number of miners, stopped the pumps, burned all the tools they could find, and after leaving instructions that they would return in case the mine was started and the scale not paid, marched back to town and disbanded. . . . . The Reciprocity Convention opened at Washington, D. C., November 19. Nearly every mercantile and manufacturing interest in the country was represented. The real work of the Convention began with the afternoon session, when A. B. Farquhar, of York, Pa., and Charles Heber Clark, of Philadelphia, opened the discussion of the general subject of reciprocity. Mr. Farquhar led in the presentation of the theme with a strong and eloquent appeal for reciprocal fairness in international trade relations. He made frequent allusions to President McKinley's Buffalo speech, which he called a "farewell address," and the Convention responded repeatedly with hearty cheers. Mr. Clark followed Mr. Farquhar with an off-hand speech based on a most careful study of the commercial history of the last quarter century. He was opposed to reciprocity, and he made a strong argument against what he called "kulfing one industry to benefit another." "What is really meant by reciprocity," said Mr. Clark, "is that you ask Germany, France or England if we can go over there and assassinate some one of their industries on condition that they can come over here and put the knife into some one of ours." The trite reasoning that the tariff is a local issue was verified in every speech made. The lumberman wanted reciprocity, because he had cut off his pine at home and wanted to get at the Canadian forests. The wool men looked askance at the idea of reciprocity with Argentina, while the hide men took an opposite view. The kult-goods people extolled the virtue of the Dingley Tariff, and saw little to be desired in any sort of reciprocity.

ADMINISTRATION.—The new Hay-Pauncefote Canal Treaty was signed in Washington November 18 by Secretary Hay for the United States, and Lord Pauncefote, the British Ambassador, for Great Britain. It gives to the United States power to guarantee the neutrality of the canal at all times, and removes the restriction on the power of the United States to fortify it. The Clayton-Bulwer treaty of 1850 is abrogated. Coaling stations for the use of the American men-of-war, which will defend the Nicaragua Canal, will be acquired by the United States now that the Isthmian Canal Convention is signed. These stations will be established at Almirante Bay, Chirlqui Lagoon, Colombia; Gulf of Dulce, Costa Rica; Danish West Indies and Gallapagos Island, off the coast of and belonging to Ecuador. While the treaty permits the erection of fortifications by the United States, the uselessness of going to such a tremendous expense is apparent to officers of both the army and navy. The great initial cost of this means of protection would be but the beginning, as it would be necessary to keep the fortifications in repair and to maintain a large garrison, which would be subjected to the ills prevalent in Central America. . . . . Suit has been brought by a London firm to obtain a return of duty paid to the Collector of the Port of New York upon imports of sugar brought from Iloilo, Island of Panay, in the Philippines.

PHILIPPINES.—Diaz, the presidente of Tacloban, Island of Leyte, who has been proved to be an agent of the Filipino junta at Hongkong, has been arrested. Many incriminating papers, implicating numerous officials, were seized at the time of his arrest. The gunboat Leyte has discovered a signal station working on the Island of Leyte and communicating with insurgents on the Island of Samar by the flashlight system. Three operators were arrested, and the station was destroyed. The men confessed that many recruits have been sent from Leyte to Samar.

GENERAL FOREIGN NEWS.—Great gales extended over the British Isles and northern Europe November 10-14. On the latter date a lifeboat and 11 men were lost at Yarmouth. The lifeboat was on its way to the rescue of a distressed vessel, when it was struck by a great wave and capsized. The crew were imprisoned and only three of them succeeded in making their escape. Innumerable cases of minor casualties continue to be reported on the coasts of the United Kingdom, marking the storm as the most disastrous that has occurred in many years. An incomplete list of the persons who have lost their lives by drowning during the storm aggregates over 160. It is still impossible to estimate with any exactitude the total loss of life and property resulting from the protracted gale, and probably the full extent of the damage will never be known. Tons of wreckage of unidentified vessels was thrown up. Altogether, it is known that about 50 vessels have been wrecked along the British coasts. Thirty-four of these have been absolute wrecks, involving, it is believed, a loss of more than 180 drowned. The Yarmouth lifeboat disaster alone leaves 44 fatherless children. There was a heavy snowstorm in Scotland and a fall of snow generally throughout the United Kingdom, especially in the hilly districts, where several shepherds lost their lives. . .

FARM AND GARDEN.—The Denver Chamber of Commerce and Board of Trade has sent President Roosevelt a letter concerning the dependence of the beet sugar industry upon the Dingley Tariff. The petitioners represent that at least 10 years are needed to put the beet sugar industry upon a basis which will be strong enough to enable it to compete with the cane sugar product raised by cheap labor. They say the beet sugar industry is the first and only industry in the West in which the farmers and producers are directly interested which has received the benefit of American policy of protecting infant industries.

The report emanating from the National Live Stock Association that the country is threatened with a shortage of beef cattle has stirred up considerable interest, and an effort is being made to have the Census Office announce the result of the live stock census made last year in time for the meeting of the National Convention of Stockmen. At the present time there are no trustworthy figures to show the condition of the visible supply of cattle in the country, but the census figures of last year will give a basis from which to make close estimates. While local packers admit a scarcity of high-grade corn-fed beef, they say the supply of ordinary cattle is equal to all demands being made.

The twenty-fifth convention of the Iowa State Dairymen's Association opened at Dubuque, November 12, with fully 500 delegates present. A delegation of 40 arrived from Chicago on a special car in charge of T. F. Gallagher and J. W. Cook, secretary of the National Buttermakers' Association. At Machinery Hall there was a display of everything in the way of creamery and dairy supplies, and all the latest inventions for making good butter were shown. The city was in gala attire, flags with the golden color of butter attached, flying everywhere.

The Michigan Merino Sheep Breeders' Association will hold a show at Detroit, December 17; secretary, E. N. Ball, Grand Blanc, Mich.

Thomas Meehan, of Philadelphia, the well-known nurseryman, and one of the most eminent of vegetable biologists, died at his home November 19, aged 75 years. He had been for many years a member of the Philadelphia Common Council, and was an earnest promoter of public education; he was also active in city tree planting, and in the formation of parks and breathing spaces in the crowded sections. Mr. Meehan was born near London, England, in 1826, and published his first scientific paper (on the stamens of the Portulacca) when about 15 years old. The devotion of the lad to botany and general science attracted the attention of a number of eminent scientific men in England, and through their efforts he became a student in Kew Gardens, where he completed a full course. He came to America more than 50 years ago, and in 1853 started in the nursery business. For a time William Saunders, founder of the Patrons of Husbandry, was his business partner. He was a prolific writer on agricultural and horticultural subjects, and was connected editorially with several publications. He was an officer or member in numerous scientific associations, and was State Botanist of Pennsylvania. Last August the Veitch Memorial Association, of England, presented him with its silver medal for "distinguished services in botany and horticulture," only the third American to be so honored. Few men of scientific pursuits have so fully identified themselves with the public good; his civic usefulness, accentuated by a genial personality, was not less eminent than his distinction in his chosen field of botanical investigation.

The National Grange assembled at Lewiston, Me., November 13 for its thirty-fifth annual session. Prosperous conditions were reported by the Master, Worthy Lecturer and Secretary Trimble. The meeting was a most impressive one.

A NEW CHAPTER ON THE SAN JOSE SCALE.

About 25 years ago there appeared on the premises of James Lick, at San José, Cal., a new species of scale insect ravaging his fruit trees. Having been a very wealthy man, and enterprising as well, he imported fruits, flowers and other things of a horticultural nature from many parts of the world, and it was finally and very correctly supposed that he had unwittingly imported this new pest on some of those foreign plants. Tahiti was at one time thought to have been the source from which it came, and latterly Japan. The spread of this new scale was very rapid, and the Californians were greatly alarmed, and tried various ways to destroy it. In that dry climate they found that a preparation called "resin wash" would hold it in check, and that is why it is not considered so serious a trouble as in the Eastern States, where it was eventually brought on fruit trees, and where this remedy is not effective because of the moister climate. As is generally known, the spread of the San José scale in the Eastern States, from a bundle of trees sent from California to New Jersey about 1886, has been so rapid and steady that now the whole country is in dread of the destruction of or very serious injury to their orchards. Legislation, official inspection, fumigation and other means of fighting the terrible evil are familiar to all progressive horticulturists.

In the course of our warfare against the San José scale the United States Department of Agriculture sent one of its most skillful entomologists, C. L. Marlatt, to Asia to hunt out, if possible, the home and the natural enemy of this insect. It was supposed that where the evil originated there might also be its antidote. Japan was visited by Mr. Marlatt last Summer in his quest, because it has long been known that this scale existed there. But he found that in every case where it existed there it could be traced back to importations of trees or plants from America. From Japan he went to Chefoo and other places in China, where he also found it in destructive numbers. He then hunted northwestward, and between Tientsin and Pekin he found it diminishing, that is, present but in small numbers, and, happy to know, along with a species of ladybug called by scientists Chilocorus similis, that was keeping it in check. This is the treasure for which the trip was made. Mr. Marlatt made the most careful study of the whole matter, and when he was sure (and he is one of the most accurate and conservative of scientists) he wrote a long letter giving all the facts to Dr. L. O. Howard, Chief of the Division of Entomology at Washington, D. C., and sent a number of the parasites of the scale to the Department of Agriculture as a trial shipment. Others will follow in due time. We have, therefore, every reason to believe that the days of the San José scale are probably numbered, or soon will be, and that we will in due time experience similar relief from the ravages of this dire enemy that the orange and lemon growers of California did from those of the Fluted scale by the introduction from Australia of the Vedalia cardinalis, which is another of the ladybug friends of fruits and humanity. While it would be wise to continue every present effort to suppress the San José scale it would seem to me unwise to cut down valuable orchards until this new means of fighting it had been given a thorough test. It was not more than three years from the introduction of the Australian ladybug until the Citrus orchards of California were safe, and it may be that the Chinese species will prove equally effective in our apple and other orchards. The brief announcement last week of this good news was from a telegram that I sent from Washington just in time to be inserted before THE R. N.-Y. went to press.

H. E. VAN DEMAN.

A SUCCESSFUL MILK STRIKE.

The daily papers recently reported a strike on the part of certain Connecticut farmers who ship milk to Providence, R. I. The following note from one of our readers shows that in this case the farmers won.

"Milk from this place goes to Boston and Providence. Those who struck here were men sending to Providence. The association, or union, as some might call it, is known as the Providence Dairy Association. The farmers here are a branch of that union. On account of the rise in the price of grain they felt as though they were justified in asking an advance of five cents per can, 35 cents for 9½ quart can; 36 for 10 quart and 37 for 10½ quart cans. The union agreed not to send any milk after Thursday, November 14, unless the milk buyers in Providence would agree to their demands. As no milk of any consequence could be got, the milk buyers agreed to give the union its price, and Sunday morning the car was carrying the usual quantity. In less than two days the strike was ended, and the farmers are happy. The milk buyers say if the union had asked 40 cents per can they would have had to pay it. The farmers only wanted a fair thing, and they feel as though they had got it. There is no strike on the Boston branch, and none likely to occur. Each organization is independent of the other. The farmers have tried several times in the years gone by to have the price advanced, but with little success, the farmers not holding together. This time the victory is complete; they feel the milk question is solved, and that in the future good prices may be obtained for it." D. C. K.

The Providence Milk Association runs a milk car from Willimantic to Providence, and the Providence Dairy Co. takes it by express from Colchester via Willimantic to Providence. The cans hold 9½ and 10 quarts, and they made the price 30 and 31 cents from October 1 to April 1. There was so much dissatisfaction that the Providence Milk Producers' Union was formed. Every shipping station has one director appointed by the members at that station. They asked the contractors on November 14 (Thursday) for a raise to 36 and 35 cents per can (this means delivered on the station platform) and to let them know by Friday or there would be no milk on Saturday. Saturday the strike went on; Sunday they wanted the milk, but too late for that day's milk. Monday morning every man's cans sent were tagged "Tell all milkmen the price of milk will be 35 and 36 cents from November 17 to April 1." The producers also asked and demanded, if the price of grain kept up to present prices, that the price of milk be kept up until May 1. We sell here at a straight price and no surplus, and when they have more milk than the market demands they simply tag the cans: "Don't send any milk to-morrow," which system we like better than the Boston way, as we can use it at home at better advantage. This station ships from 75 to 120 cans per day, and they carry on the milk car from 1,000 to 1,600 cans per day. L. P. A.

Baltic, Conn.

A "SECOND CROP CRANK."—I am just through harvesting about one acre second crop Triumph potatoes. I send one of the largest tubers. Seed planted August 10; harvested November 12. How is this for a 92 days' growth? One season I grew two crops Shoe-peg corn; first crop planted about April 1, ears from same pulled and dried above kitchen stove and planted July 15. The result was thoroughly matured ears before a frost. The grain from these was planted following year with no marked difference in yield from first and second crop seed. But, in my opinion, second crop Triumph potatoes double the yield of first crop. You perceive I am a kind of "second crop crank." I have now four or five varieties second crop potatoes, bush beans, tomatoes, etc. D. W. R.

Hickman, Ky.

R. N.-Y.—The specimen of Triumph sent us weighed 14 ounces. A lively speed that for 92 days' work! What an advantage to live in a country where two crops are possible, and where cow peas can be grown between two crops of grain!

Woman and Home

From Day to Day.

THE ORCHARD STREETS.

Over the orchard the children pass,
In and out 'mong the old brown trees;
Searching for apples among the grass,
None in the cellar are equal to these.
Sweetened by frost they are juicy and rare,
Colored by wind, they are tempting to see;
All the delights of the sun and the air,
Meet in these apples that fall from the tree.
City-bred Nell in her scarlet cloak,
Stoops as she picks up a ruby prize;
"This must be Apple Street," dreamy she spoke,
While she contemplated color and size.
"When the Spring comes 'twill be Blossom Street all.
Streets in the city don't change so, you know;
But 'twill be Brown Street along in the Fall,
And in the Winter this street is called Snow." —Annie L. Jack.

*

THE commonest form of extravagant cooking is the neglect to make the best use of simple materials. It often seems easier to concoct an elaborate dish than to make a simple one so delicious that those who eat of it shall desire nothing better.

*

GOOD authorities recommend that a turkey, during roasting, be placed in the pan with the breast down. This adds very materially to the flavor, because all the rich juices and the flavor of the dressing flow down into the breast of the fowl. As ordinarily cooked, the white meat is rather lacking in flavor. At first thought it may seem awkward and inconvenient to cook the bird in this position, but it is really as easy as any other.

*

HENRY J. Allen, chairman of the Kansas State Board of Charities, is constantly importuned by young women who desire to obtain positions in public institutions. He advises them to go home and learn housekeeping and says:

There are thousands of homes in Kansas where a girl who knew how properly to cook and sew and make beds and do ironing might make $4 to $5 a week, with board and washing. The reason why domestic help gets no better wages is because most of them are ashamed to become competent in their service. A majority of girls who seek positions in homes have not fitted themselves to excel in the work they seek to do; hence, they do it poorly and get low wages for it. Any level-headed girl who will study cooking and general housework and master it, can secure pleasant employment, at profitable wages, and the service is just as honorable as measuring calico or answering hello calls in a telephone or teaching in the school room or playing on a typewriter. All honest service is honorable, and the experts in any branch of it can always get wages commensurate with their skill.

*

RECENT experiments conducted at the University of Minnesota for the purpose of studying the nutritive value and digestibility of bread made from different samples of flour gave results differing decidedly from popular impressions. According to the chemical analysis of graham, entire-wheat, and standard patent flours milled from the same lot of hard Scotch Fife Spring wheat, the graham flour contained the highest and the patent flour the lowest percentage of total protein. But according to the results of digestion experiments with these flours the proportions of digestible or available protein and available energy in the patent flour were larger than in either the entire-wheat or the graham flour. The lower digestibility of the protein of the latter is due to the fact that in both these flours a considerable portion of this constituent is contained in the coarser particles (bran), and so resists the action of the digestive juices and escapes digestion. Thus while there actually may be more protein in a given amount of graham or entire-wheat flour than in the same weight of patent flour from the same wheat, the body obtains less of the protein and energy from the coarse flour than it does from the fine, because, although the including of the bran and germ increases the percentage of protein, it decreases its digestibility.

*

DURING the middle of the Winter many large stores make special sales of white goods and table linen, and this is the most favorable time to replenish a stock. It is much easier to buy a piece of linen occasionally, thus keeping up the stock, than to allow it all

3968 Misses Double Breasted Coat, 12 to 16 yrs.

to become worn, necessitating an entire new supply. Fringed cloths, often used for luncheon sets, are handsome at first, but they soon look ragged, because, with the best of care, the fringe breaks and wears in washing. Plain hemming (hand work, of course) is always best and most durable, or hemstitching where time or inclination permits. Although many busy women think that they cannot take time to hem table linen by hand, and must always rush across it with the machine, the hand work is really a gain in the end, for if properly done, it never whips out at the ends; it irons more smoothly and certainly looks better. Plain butcher's linen with hemstitched borders makes very satisfactory covers for trays, serving table or sideboard. Colored silk embroidery would better be omitted from all such articles intended for daily use, because such decoration requires too much care in washing, and the plain linen, well washed, is always in good taste. Anyone who thinks that "washing" silk may be washed just like anything else will have a sad awakening. White coronation braid is very easily applied to linen designs, and gives an effect fully as handsome as embroidery; this may be washed without any risk.

The Rural Patterns.

Severely plain, double-breasted coats are much worn by young girls, and have the merit of being eminently serviceable as well as stylish. The model shown combines the box front with the half-fitted back and regulation coat collar. The original is made of tan-colored kersey cloth with smoked pearl buttons; but cheviot and plain cloth are equally appropriate and blue, brown, black and Oxford are all correct colors. The fronts of the coat are loose, but are curved at the under-arm seams to follow the outline of the figure. At each side a pocket is inserted, the opening being finished with a stitched overlap. The back includes a curved center seam and under-arm gores. The neck is finished with a collar, faced with velvet, that rolls over with the fronts to form lapels. The sleeves are in regulation coat style stitched to simulate cuffs. To cut this coat for a miss of 14 years of age 1½ yard of material 54 inches wide will be required with ¼ yard of velvet for collar facing. The pattern 3968 is cut in sizes for misses of 12, 14 and 16 years of age; price 10 cents from this office.

No other coat worn by small boys quite takes the place of the reefer. Chinchilla, kersey, melton cloth and cheviots are all appropriate, and fashionable colors include dark blue, brown, Oxford and tan. The smart little model illustrated is in box style, with curved under-arm seams. The fronts are double-breasted, with a liberal supply of pockets that are finished with overlaps. The neck is finished with a collar of generous width that rolls over with the fronts to form lapels. The coat sleeves are stitched to simulate cuffs and the coat is closed by both buttons and buttonholes. To make this coat for a boy of 8 years of age 1⅜ yard of material 44 inches wide or 1½ yard 50 inches wide will be required. The pattern 3969 is cut in sizes for boys of 4, 6, 8, 10 and 12 years of age; price 10 cents from this office.

An Old-Time Thanksgiving Dinner.

A holiday dinner in all of its complexities is quite an arduous transaction in any time or age. But if a modern housekeeper was at the mercy of a fire-place, with only a brick oven in the background which had to be heated by first building a huge fire in it, and then cleaning out the débris before using, in lieu of the ample range with its many convenient appliances for controlling the temperature, she would certainly feel that a Thanksgiving dinner was a more serious affair than she usually accredited it to be. Also, that she had much spare time in the preparation of a dinner in which to return thanks for many hitherto unacknowledged blessings. But this same old oven, as a reward for the trouble it gave in getting it ready to do its part towards the Thanksgiving dinner, never played its mistress false. All the pastry which came out of its cavernous depths was all that pastry should be. None of the flaky tarts, mince, apple, or pumpkin pies was ever burned to a cinder by a forgotten valve left inadvertently open, and the wholesome brown bread and rich cakes were always triumphs of culinary skill.

Again it must have been an unenviable task to achieve the correct shade of brown in the pigs and turkeys, when roasting before a blazing fire, where scorching was not an unknown quantity. Or the handling of the huge pots which were suspended from cranes over the fire and held the vegetables, puddings, and other delectable things; what innumerable scalded fingers must have been the outcome of the drainage of those pots!

3969 Boy's Reefer, 4 to 12 yrs.

There are two sorts of lamp chimneys: mine and the rest of them.

NEW YORK.

This good old-fashioned Thanksgiving dinner, if handicapped in the cooking, was much more simply served, and would seem as unique now as one of many courses in days long gone by. If the desserts, all manner of sweetmeats and dainties were loaded on the table at one time, sandwiched in between meats and vegetables promiscuously, with no respect to the general fitness of particular dishes, all eaten haphazard from the same plate, utterly regardless of the laws which govern the digestion, the good will and jovial cheer which prevailed was as bountiful as the food, and served out in much the same manner.

Thanksgiving, though essentially the American season for home gathering, meant more, especially an old-time festivity, than it usually does now, when so many holidays are celebrated. The Thanksgiving of our grandfathers was an annual reunion of all of the separated members of the family, from far and near, who came together on this day for the only time, while often distant wanderers with slight claims to kindred found their way back and were received with warmth. Each added member meant more merriment, and was welcomed accordingly, rather than more work, which is too frequently the case with the modern guest.

After the dinner the wildest amusements were participated in with no fear of despoiling a too elaborate apartment or sacrificing useless bric-a-brac, and no one was addicted to nerves. Perhaps there would be less hazing with our college boys if a little of their riotous mirth was occasionally let loose in the bosom of their families, necessitating less abroad. It is much to be regretted that the good old-fashioned Thanksgiving dinner with the accompanying hilarity belongs to the buried past. SARAH RODNEY.

Garden Talk from Ohio.

A warm, bright day the last week in October enabled me to get into the cellar all plants that I wanted to keep over Winter. The Canna roots were shaken free from soil and put into a tub of dry sand, along with some "gilt-edge leaf" geraniums, pretty to use for border plants next season. A large rose geranium bush was also put into a bucket of sand. The Coleus, all battered and bruised by wind and weather, were thrown away. I then spaded the bed up and raked it smooth in readiness for the tulips; their brave, flaming beauty is very cheering, I think, when Spring—in northern Ohio, the most tempestuous and treacherous of seasons—seems determined to make us wear mittens and overshoes until the bells ring in the Glorious Fourth. As a nerve tonic, digging flower-beds is a thousand times better for women than any golden specific on the market. And the more you take the better you like it. The tulip bulbs were planted about five inches deep and five inches apart, a little sand being put into each hole before inserting the bulb, and a little more after. The bed was then raked over and covered with leaves, then brush on top to keep the wind from blowing them away, and lastly encircled with wire netting to keep the chickens out.

There was no need to cover the pansy bed, for only one little plant had survived the drought of August and September. Up to that time there were over a hundred plants doing fairly well; the blossoms were small, but of great variety, and I felt sure that, with a little protection, I could keep them over Winter and they would make a fine showing in the early Spring, having done the trick successfully two years ago. But the fruit business interfered with my flower show. I could not keep that bed watered, and Dame Nature would not, so it must be written down a failure. Pansy plants in good condition should be covered lightly with dry leaves quite late in the season—after hard, freezing weather—and when the mercury drops down to zero add a light covering of straw; remove this gradually in March, and a few warm days will coax the dearest flowers on earth out to greet you. Sweet peas failed the past season, though I never had a more promising looking row. But on the Fourth of July, just as they were coming into blossom, a great wind and rainstorm whipped and beat them nearly off the trellis. The heads blighted, and it seemed no amount of coaxing could bring back their lost vitality; still I might truthfully say that we had sweet peas from July till November, for one or two stalks let us know, by an occasional blossom, that they were still in the battle of life. California poppies (Eschscholtzia) were also a disappointment. Perhaps they were planted too late; perhaps they did not get enough sun; at any rate, the bed of "gleaming gold" failed to materialize. The plants look thrifty now, and a neighbor has told me that, with some protection, they will survive the Winter and blossom all next season. If I can, I like to hold on to anything that I've watched and hoed and watered for three or four months. I wonder how many friends we let slip away from us in a year through sheer neglect! But of course we're not going to pet people as we do flowers; they would never understand it in the world! Not a failure were the Zinnias—the curled and crested sort. The scarlet ones were so large and double as to be mistaken for Dahlias, and there were some lovely clear pink ones. A bed of scarlet Zinnias alone is most effective. They are cheap and sure.

A few warm days the latter part of April lured me into setting out my geraniums. They were stocky little plants, most of them blooming, and I had hardened them on the porch for several days. But it was a bad move. The mercury went down almost to the freezing point shortly after, and there was no more warm weather till June. By that time my poor geraniums had become so *hardened* that the hot weather knocked them right out; i. e., some of them died and none made any showing to speak of all Summer. I think I shall wait patiently hereafter until the last week in May before bedding out geraniums.

The prettiest thing on the place the first week in November was a Kieffer pear tree, its luxuriant, glossy foliage gleaming with all the various tints of brightest to darkest crimson. Could an artist paint it true to nature on canvas, the critics would talk about the color being laid on with a trowel, I am sure.

A 10-cent can of red paint will cover a multitude of old discolored flower pots and boxes, and add 50 per cent to the neatness and attractiveness of your house plants. I know it has been held that plants do best in porous pots, but I believe that theory has been turned down. Too many fine, thrifty plants in tin cans have held up their heads and declared that they did not have to breathe through their pots. But I will not paint flower pots with yellow ochre as some people do; neither would I paint them sky-blue; red, dark green or very dark brown are colors best suited for this purpose. DOCIA DYKENS.

ONAISY is th' head that wears a crown? They'se other heads that 're onaisy too; but ye don't hear of thim.—Mr. Dooley.

SINS of the tongue are especially dangerous because people do so little in the way of restitution or reparation for them.—Francis De Sales.

Rural Recipes.

—O! now doth come the jocund Fall
With ripened nut and apple;
The harvest's big and best of all,
It bringeth luscious scrapple!
—Phila. Record.

Tomato Chips.—One-half peck of green tomatoes, three onions. Chop them separately, the onions quite fine, but the tomatoes coarser. Put together, and mix with them one-half cupful of salt. Let stand over night in granite dish. In the morning drain through a colander. Take one pint of vinegar and one quart of water, add the tomatoes, cover and boil 20 minutes. Drain again. Take two cupfuls vinegar, and 1½ pound light brown sugar, one-fourth pound white mustard seed and one-eighth teaspoonful cayenne pepper. Add the prepared tomatoes, and cook 15 minutes. This makes five pints. Put up in small glass fruit cans. This is not a pickle, but used as a sauce or relish. The color a fine amber.

Quince Conserve.—Four pounds of quinces, pare, quarter. Cook the quinces in little water, until tender enough to cut the quarters across in thin slices (not too thin), three pounds granulated sugar, one-fourth pound of candied ginger root (or you can use preserved ginger, sliced thin), two lemons, juice and yellow rind (grated). Put all together in granite kettle, add one-half pint of water. Boil the whole 2½ hours. Put in jelly glasses when cool, cover with melted paraffin, put on cover and seal. This is perfectly delicious. It is nice to serve a spoonful with ice cream or other dessert, or with cake. It is very rich, and a beautiful red color.

Apple Cream Cake.—Prepare the cake by beating the yolks of three eggs until light and creamy; add 1½ cupful of sugar, one tablespoonful of lemon juice, the grated rind of half a lemon and one small half cupful of water. Sift two teaspoonfuls of baking powder with two cupfuls of flour; cut them into the egg mixture and lastly add the beaten white of the eggs. Bake in two round shallow pans, and when they are done split them and spread with the apple cream, made as follows: Steam three large sour apples until they are soft, then rub them through a sieve. Beat the whites of three eggs stiff and gradually add three-fourths of a cupful of powdered sugar and a few drops of lemon juice. Add the apple and beat it until stiff enough to stand alone. Place on ice and spread it cold upon the cakes, which may be either hot or cold. Serve with whipped cream.

$20,000

in prizes given by THE LADIES' HOME JOURNAL and THE SATURDAY EVENING POST; in addition to first-rate pay for work that is easy and pleasant and sure.

One woman got $1485 last winter; another $1216; another $900; a man got $1004; another man $937.

No chance of not making anything. It is almost too easy—people sometimes get the idea they haven't got to do anything at all.

BUCKWHEAT averaged only a fair crop. Several carloads have been shipped from this place, prices ranging from $1 to $1.10 per 100 pounds. The best paying crop this year is potatoes, which are bringing good prices, and were truly an immense crop in some instances, and of a fairly good quality. There have been a goodly number of carload lots shipped from this station already, and it is said there are from 12,000 to 15,000 bushels still in sight in this town. Prices opened at 40 to 45 cents per bushel, gradually raised to 50 to 55 cents, and now dealers are scouring the hills offering 60 cents per bushel. This is the time that the "cautious" producer is doing a heap of thinking under his hat.

Erin, N. Y. G. E. M.

In answer to many inquiries reeeived from the farmers, we are making them a proposition, whieh is worth money to them.

WON'T YOU WRITE TO US?

Prolong your lives, save time and money by having a telephone system on your premises. Our

A Liberal Proposition.

Thrice-a-Week World and The Rural New-Yorker } $1.65 A YEAR

One of our special offers is the Thrice-a-Week World and The Rural New-Yorker combined for $1 65 a year. By this arrangement you are sure to obtain all the news of the day, and information of special interest to the farm and home at the same time. The Thrice-a-Week World is a clean, reliable newspaper, and the low figure at which it is offered, in conjunction with The Rural New-Yorker, should make the combination unusually attractive.

To January 1, 1903, for $1. New subscribers to THE R. N.-Y. will now get the paper from the time subscriptions are received until January 1, 1903. If you will send us a club of four subscriptions, new or renewal, with $4, we will advance your own subscription one year free.

GLENN RANCH,

Glenn County, California,

FOR SALE IN SUBDIVISIONS.

This famous and well-known farm, the home of the late Dr. Glenn, "the wheat king," has been surveyed and subdivided. It is offered for sale in any sized government subdivision at remarkably low prices, and in no ease, it is believed, exceeding what it is assessed for County and State taxation purposes.

This great ranch of 40 000 aeres runs up and down the western bank of the Sacramento River for 15 miles. It is located in a region that has never lacked an ample rainfall, and no irrigation is required.

The river is navigable at all seasons of the year, and freight and trading boats make regular trips.

The closest personal inspection of the land by proposed purchasers is invited Parties desiring to look at the land should go to Chico, California.

For further particulars and for maps, showing the subdivisions and prices per acre. address personally or by letter,

F. C. LUSK,

Agent of N. D. Rideout, Administrator of the Estate of H. J. Glenn, of Chico, Butte County, California.

WANTED.—A Truck Gardener. Five aeres of garden and 20 acres of park to care for. A first-rate market for vegetables, besides the school of 60 persons to be supplied. Will pay $15 per month and 10 per cent on all stuff raised and disposed of. All supplies and help furnished. If man is married, can give employment to wife. WM. W. SMITH, Trinity Hall, Washington, Pa.

The INGERSOLL Dollar Watch

This is no catch-penny advertisement in which you are ensnared by the wonderful offers, "we trust you," "send no money," "free," &c. So if you are looking for "something for nothing" **don't waste any more time.** Ours is simply the business announcement of a factory making **six thousand Watches a day**, and wishing to tell the people about them in an **honest, straight-forward way.** It is true we want to sell you our goods, but by strictly business methods only, consequently we show an exact picture of the watch and tell you exactly its price. We prefer you to buy it of your dealer, but if not convenient for you to do so, **send us $1.00** and receive the greatest watch bargain ever known. Guarantee in every watch (see cut). Catalogue Free.

R. H. INGERSOLL & BRO. DEP'T. 220 67 CORTLANDT ST. N.Y.

MARKET NOTES

FEATHERS.—Readers ask how they can dispose to best advantage of the feathers from poultry dressed for the holiday trade. They may be shipped to the same dealers who handle the poultry in New York, who will hold them until picked up by feather buyers who come around the markets regularly. Those who have large quantities of feathers to ship would better write to dealers in bedding supplies, as Taylor & Ellis, 261-263 Canal St., New York.

A MILK RAID.—A number of Paterson, N. J., milk dealers had a visit from a force of State inspectors November 18, and the result was that large quantities of watered milk were dumped into the gutter, thus making a temporary milk famine. This is the result of the enforcement of the pure food law which went into effect November 1. The law is very severe, and, if it be thoroughly enforced, many New Jersey frauds will find it necessary to look for other pastures.

GLUCOSE HONEY.—The Chicago pure food inspectors are after those who are putting various adulterated products on the market. One of their latest finds was a lot of extracted honey from California, which chemical analysis showed to be more than half glucose. They gave the consignee the choice of selling it as a glucose mixture or sending it back, and he did the latter. Glucose is particularly adapted to the adulteration of syrups, honey and brown sugar, as it is of a beautiful light amber color and mixes in well. It is agrecable to the taste and not harmful, but is a fraud because it gives bulk without adding much sweetening power to these products. When brown sugar was used more largely than at present, people frequently complained that it took an unusual quantity to sweeten a cup of coffee. This was owing to the glucose, which has a habit of dissolving and disappearing without leaving a trace of itself by way of any peculiar flavor. At one time a large amount of what was called "corn syrup" was sold in Ohio and neighboring States. This was evidently largely glucose. It cost 40 cents per gallon, and was extensively used in boarding houses as a lubricant for pancakes.

APPLES.—Pacific coast apple men now have an unusual opportunity. Ordinarily California and Oregon apples are so expensive that they are considered luxuries, and comparatively few are sold in New York. This year the crop in the East was so short that Western boxed apples can nearly compete in price with the better grades of home-grown fruit. Of course in a season of plenty this trade would be impossible, for New England and the Middle States can produce as fine apples as are grown anywhere, and there are thousands of acres of land here particularly well suited to apple culture, which with intelligent handling could greatly increase the output of good fruit. The present high prices for apples are likely to stir up a good many people to go into the business who have but a dim idea of what is necessary to produce prime fruit. They think that an orchard can be set out and left to fight its own battles with tough sod, worms and diseases. About all that they do is to trim roughly now and then, and harvest the fruit. Such orchards, unless they chance to bear in an off year, are never profitable, for the low-grade fruit will hardly pay for handling in an apple year. What does find its way to market is a nuisance, and goes for almost any price that is offered. The margin of profit in an orchard producing the best apples is small in a season of plenty, and those whose fruit is better than the average are usually disgusted with the business, when they get only 40 or 50 cents per barrel, as is sometimes the case. The remedy lies in better fruit and improved methods of marketing. The small package (box or keg) has come to stay. The extent of this trade will depend upon the interest growers take in it and the pressure they put upon their receivers to bring this small package to the notice of consumers, so that they may know that a convenient quantity may be had in a package direct from the grower. I noticed a box of California Spitzenbergs. Each apple was wrapped in paper, and they had been so carefully handled that the natural bloom remained. There were four layers, each containing 32, all packed one way. The price asked for the box was $3. It is doubtful whether it would pay to take such extreme care in making shipments to New York from nearby points. In that case the two essentials would be good fruit and a package small enough to be handled by an ordinary family without facilities for storing a whole barrel. W. W. H.

LIVE POULTRY IN NEW YORK.

Probably few outsiders are aware of the extent of this trade, and doubtless a great many who have lived in New York all their lives scarcely know that live poultry is sold here at all. The reasons are that the trade is restricted to certain sections of the city, and practically to one class of people, the Jews. The city authorities try to keep this business bunched together, so that they may watch it and enforce sanitary rules. As is well known, the religious regulations of the Jews require that all meats eaten by them shall be killed by their own butchers and in their peculiar way. The following facts were obtained from Charles Collins, a live poultry dealer on Jay Street, New York:

"Where do the largest quantities of live poultry come from?"

"The West and Southwest. Indiana sends more than any other State."

"What proportion of the trade is with the Jews?"

"Practically all; dressed poultry is used for all but the Jewish trade. There are really no other butchers now who make a business of killing their own poultry."

"Is there any trade with suburban residents who want to keep a few fowls?"

"A very little. This is more especially with people who go to the country for a time during the Summer and take along a few to fatten and kill as they want them."

"How extensive is this live-poultry business?"

"The average weekly receipts are 35 or 40 cars. During the Jewish holidays of Spring and Fall, the demand is about doubled, 75 or 80 cars per week being used."

"What kinds of poultry are most desired?"

"Fowls, ducks and geese. More chickens than usual were used this Fall on account of the poor quality of many of the fowls, which were moulting. The quality for the Jewish holiday trade must be better than at other seasons. They prefer large, fat fowls, the larger the better. Those weighing eight or nine pounds are most desired. For the dressed poultry trade these are too heavy, four or five pounds being best. These extra large fowls come chiefly from Burlington County, New Jersey."

One reason why the Jews wish very fat poultry is that they use the grease in the place of lard, the latter being a product of swine, which is forbidden food to them. The receipts of live poultry from nearby sections show a large proportion of culls. Farmers go over their flocks and pick out the old and worn-out hens. Speculators come around and buy these up for shipment. In Indiana and other sections where a business is made of raising poultry for shipment alive, the conditions are different, and only a moderate proportion of culls is found in such receipts. But few pullets are sent, the majority being fowls and cockerels. Mr. Collins said he had just paid three cents extra per pound to get a lot of pullets.

Milk Notes.

The ground is white with snow, and has been for three or four days. Wild geese are flying South; the writer saw a flock of 60 to-day (November 18). Cows are stabled day and night; the sudden cold weather gives them a ravenous appetite. They consume as much food now, or more, than at any time during the year. The flow of milk has shortened one-third in the past few days, in spite of liberal feeding. It has been a very "milky" Fall; both the feed and the weather have been favorable for a large flow. The Chenango Valley Dairy Company receive about 110 cans of milk per day at their coöperative creamery. Some milk is shipped, the remainder is made into butter, and the skim-milk into curd. Patrons received for their milk during July 80 cents, August 88 cents, September 83.2 cents per can of 40 quarts. Cows are in good condition and health. Fresh cows bring from $30 to $45. Mill feed is high in price; Spring bran $20, Winter bran $21, middlings $22, hominy $23, cornmeal $26, gluten feed $23, malt sprouts $19, dairy feed $21 per ton. Farmers in this locality will not be obliged to purchase as much mill feed as last Winter, as the corn and hay crops were good. We have a great many silos in this section, and all are filled. The silo is indispensable to the dairyman making Winter milk. E. C. J.

Greene, N. Y.

National Horse Show.

The annual exhibition of the National Horse Show Association was held in Madison Square Garden, New York, during the week ending November 23. This show is gaining in popularity each year, the one just past eclipsing all previous records in attendance and the number of animals entered. There were 1,434 entries, 200 more than last year. One reason given for this increased general interest is the success attained by American racers during the past season, both here and in Europe. The performances of these speedy animals are so thoroughly advertised by the newspapers that new interest is aroused in many who have but little to do with horses ordinarily in business or pleasure. No common horses are shown here. They are the best of their types, and most of them have had special training for this work. They include all classes except the heaviest draft animals, to which but little attention is given. Probably there is no better place to study all kinds of horses, and the farmer and breeder within reasonable distance of New York can spend two or three days to good advantage in looking over the show. Opportunity is given to examine the animals in their stalls, as well as to see them on exhibition in the ring. But few farmers would be able to give the time and attention necessary to finish a horse for the class of trade here represented, but they can see what type of raw material is wanted, and those who intend to raise colts might as well produce those that will sell for $300 as $100. The Hackney has lost a little of the popularity which he had two or three years ago, but still he is a favorite with many people, and no one can help admiring his strength and beauty and the business-like way in which he handles his work. Of course, jumpers, trotters, high-school horses and other special performers, attract most attention. Probably next in popularity come light roadsters, of which a great variety is seen. They are clean-gaited animals with plenty of speed and life for general use, the kind that make driving a real pleasure. There is but little danger of overstocking the market with horses of this type. W. W. H.

BUSINESS BITS.

READERS having good hay for sale will do well to write to F. D. Hewitt, 120 Liberty St., New York.

THE week's wash still remains the hardest work confronting the farm housewife. It is possible, however, to lessen the exertion by adopting modern labor-saving appliances, and among these the "1900" washer holds a high rank. Write for catalogue and full particulars to "1900" Washer Co., 143 P State St., Binghamton, N. Y.

FARMERS and stock raisers who have used Brighton's Swine "V" highly commend it as the most effective and humane device for preventing hogs from rooting. It is also useful as a stock marker and calf dishorner. But write for circulars and then you'll know all about it. Address Farmer Brighton, Fairfield, Ohio.

SEVERAL weeks ago THE R. N.-Y. had an article on bone cutters, in which the fact was mentioned that strong power is required to turn the crank on some of these machines. People who know what they are talking about say that the newer cutters are fitted with ball bearings and other devices which greatly reduce the power formerly required. The manufacturers offer an easy solution of this matter. They send the cutter on 30 days' trial. That gives a poultryman plenty of opportunity to test his strength on them, and surely nothing could be fairer! No one can question the great value of cut bone for poultry.

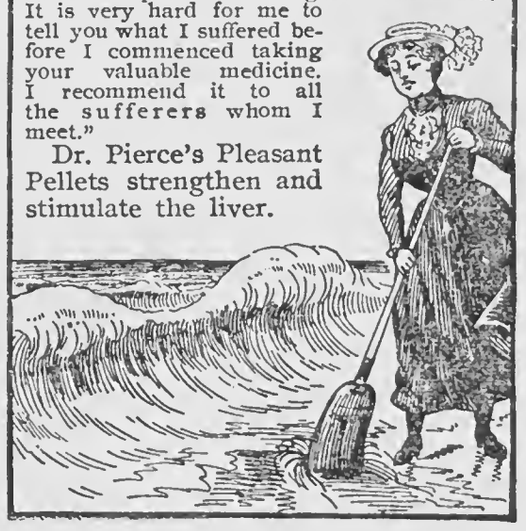
Do you turn your horses out for the Winter? If so, we want to call your attention to a very important matter. Horses which have been used steadily at work, either on the farm or road, have quite likely had some strains whereby lameness or enlargements have been caused. Or perhaps new life is needed to be infused into their legs. Gombault's Caustic Balsam applied as per directions, just as you are turning the horse out, will be of great benefit; and this is the time when it can be used very successfully. One great advantage in using this remedy is that after it is applied it needs no care or attention, but does its work well and at a time when the horse is having a rest. Of course it can be used with equal success while horses are in the stable.

It's Time Wasted

And strength wasted, to try to push back the rising tide with a broom. It's just as great a waste of time and a far more serious waste of strength to try to push back the rising tide of disease with the "nervines," "compounds" and "nerve foods" which simply drug the nerves into a drunken stupor. They make you feel good? So does whisky, while the feeling lasts, but the reaction is dangerous and deadly. Dr. Pierce's Golden Medical Discovery is a temperance medicine. It contains no alcohol, opium, cocaine or other narcotic. It strengthens the body by purifying the blood and increasing the supply of that vital fluid. It heals diseases of the stomach and organs of digestion and nutrition and thus removes the obstacles to a perfect nourishment of the whole body.

"Six years ago my stomach and heart troubled me so much I had to do something, as the doctors could not help me," writes Mrs. S. A. Knapp, of San Jose, California, Box 392. "I went to San Francisco and had treatment for catarrh of the stomach and was better for some time, then it came back. I then used Dr. Pierce's Golden Medical Discovery and 'Pleasant Pellets.' These medicines cured my stomach. I do not have the pain and indigestion as I did. It is very hard for me to tell you what I suffered before I commenced taking your valuable medicine. I recommend it to all the sufferers whom I meet."

Dr. Pierce's Pleasant Pellets strengthen and stimulate the liver.



BRONCHIAL CONSUMPTION.

From Dr. Robert Hunter's Lectures on Lung Diseases.

Of the many forms of Bronchitis, the one most alarming of all is that in which the symptoms closely resemble those of consumption, and hence called consumptive bronchitis, or bronchial consumption. You must not, however, understand from its name that it is really tuberculosis in character, or produced by the bacilli which cause true consumption.

In all lung cases I require a portion of the expectorated matter coughed up by the patient to be brought to me, or sent in a small bottle by express, before giving a definite opinion of the disease. If, on examination, I find the tubercle bacilli present, the case is consumption; and if no bacilli—Bronchitis. A large percentage of those who die of lung disease, supposed to be consumption, are really deaths by chronic bronchitis resembling consumption.

A remarkable instance in verification of this recently occurred. A lady was brought to me in what appeared the last stage of consumption. Her physicians had told her husband that she could not live a week. She had a bad cough, puriform expectorations, night sweats and was wasted almost to skin and bone. Judging by her symptoms and appearance, it was impossible not to fear that she had come too late. On sounding her chest, however, I was surprised to find no solidification by tubercles, and on examining her sputum a total absence of the bacilli. The history, too, of her sickness revealed that it had followed an attack of whooping cough and grippe. So, although her pulse was 120 a minute, and so feeble as to be hardly perceptible, and the wasting of her body so extreme that she could not stand without support, I did not hesitate to pronounce the disease bronchial, and give it as my opinion that, if we could sustain her strength long enough for remedies to act, she would be saved. She was immediately placed under medicated air treatment, with tonics to impart appetite and digestives to help the enfeebled stomach to transform nourishments into chyle and blood. Within a week she showed signs of improvement. Her progress was necessarily slow, as the healing powers of the body were nearly exhausted before the first inhalation was given, but she gradually acquired more and more strength, and within six weeks was able to take short walks in the open air. She recovered perfectly in about six months, and is alive and well to-day.

This case shows the importance of a correct diagnosis and proper adaptation of the treatment of the conditions to be remedied. Had the true nature of her disease not been discovered just when it was, she would have lost her life through wrong treatment, and been recorded as another death by consumption.

Every form of bronchitis is curable by local antiseptic and healing remedies applied directly to the lungs by medicated air inhalation, but none of them by stomach treatment. The stomach is not the part affected. The air tubes and cells of the lungs are the seat of every bronchial disease, and unless remedies capable of changing their bad secretions and healing the inflamed tubes are applied to them, cure is impossible.

DAIRY AND FARM NOTES.

Building the Dairy Barn.

PART II.

EFFECT ON DAIRY COWS.—The highly-bred animal, of course, is the first to succumb, because she is last to sacrifice milk, and the remark becomes current that the purebred is more tender and susceptible, which in a way is true. The animal possessed of a more selfish nature provides against such vicissitudes by laying on fat, as extra woolens, and by milk shrinkage. I do not think we should ignore entirely the habit of self-preservation, because we have not been able to make artificial conditions so perfect that the cow does not need some essentially so-called "hardiness." The happy medium seems wise in this instance as in most cases; a good strong constitution, made stronger by proper surroundings, which means increased available vital force for milk or beef, as the case may be, instead of a strong constitution for the purpose of withstanding unnecessary drain upon its vitality. It should be remembered that the greater effort and expenditure of vital force developed through food is for self-preservation in the animal, heat, energy and building of waste tissue, and the smaller proportion expended for available return. Every unit of vital force, therefore, given out to ward off the evil effect of cold, damp stables is taken from the profit side of the ledger in the form of milk, flesh or health. It is not alone the present generation with which we deal, but the offspring is most certainly affected by unnecessary drain of vital energy upon the parents. In animal life as in the human, the first effect of over strain is a "cold." I wish some would testify as to the origin of the word as applied. We are certainly not cold; on the contrary, the first evidence in both animals and man is a fevered condition. Call it what you will, this peculiar disease, or, more clearly stated, forerunner of disease, is caused by an over draft upon available vitality and a desire to meet it. The digestion is at once called upon with increased vigor and sooner or later is overtaxed; then comes the "cold" and then—why, of course, if there is a tuberculosis germ in the neighborhood he floats around and finds lodgment in the part of the animal which by virtue of his ancestry is weakest. No one will deny the force of the argument, but thousands will deny the practice of it to the animals in their keeping. Have you ever watched the steam gauge dial and observed the indicator fall 10 pounds at each stroke of the piston in some of the big fellows that run a large plant or on ocean steamers, and see it come back to its original position before another draft for a second stroke? All works well until the call for steam is beyond the capacity of the boilers to supply, and then if a storm overtakes the boat at this critical time she is at the mercy of the wind. Just such conditions as we have been discussing have made possible the protracted struggle between the old State Board of Health in New York, and bodies of a similar nature in other States on one side, and farmers chiefly upon the other, and, in order to carry out the respective notions, have in my judgment gone to extremes. It seems to me now that the chance for extreme action on the part of the State board having been eliminated, the conservative force should be felt in a way that will not antagonize, but bring forth fruit in a way of health and comfort to our animals, leading at the same time to increasing confidence on the part of city consumers, and consequently increased consumption of the crude product. This relieves the congested condition of the markets when overstocked with butter and cheese. At such times prices are always low, and low prices have a redeeming feature, in that they increase consumption. H. E. COOK.

ADVICE ABOUT GRAIN FEEDING.

One of our readers in Connecticut asks the following questions: "I keep a dairy and sell milk to the consumers direct. My cows are Jersey, of average size. I have plenty of corn and stalks, and can buy bran at $21, wheat feed at $22 and gluten at $30. Give me a proper ration for cows in full flow of milk. I wish also a suitable ration for work horses; they are used every day at ordinary farm work, and do not travel on the roads very much except in peddling milk, at which they take turns." What, with your experience and this feed, would you buy in his place? Let us know what you consider the most economical ration for such cows. What would you do with this ear corn, and how much grain per day would you feed?

BRAN AND SHELLED CORN.—We feed work horses about 20 pounds Timothy hay, with wheat bran and shelled corn equal parts, quantity governed by size of horses and amount of work being done. For cows we feed ears of corn ground fine and gluten, equal parts, with nearly as much wheat bran in weight as of gluten and meal, and as much good hay as they will eat up clean. We have never succeeded in curing cornstalks so they would be a good feed for cows. If we dry them in the fields sufficiently so they will not mold in the barn, the cows will not eat them; if fed when moldy, milk will have a taste which will be objectionable to customers. Regardless of price we have a rule to feed either wheat bran or middlings every day. The head of the herd is usually compelled to eat the stalks.

Portland, Me. J. H. R.

A RATION FIGURED.—We understand that the animals are Jersey cows of average size, in full flow of milk, with plenty of home-grown corn and stalks, presumably no other roughage. Wheat bran is $21 per ton; wheat feed $22, and gluten meal $30. We should give them all the corn stover they would eat up reasonably clean, and should prefer for better results that it be cut, and each feed allowed to soften 12 hours by pouring over the pile a few pails of hot water to which a little salt had been added, covering the pile with an old blanket. We should do all possible to make the food palatable without too great expense. For the grain part of the daily ration we should give two pounds coarse wheat bran, four pounds cornmeal, and four pounds gluten meal. The cows will eat about 20 pounds of the stover and with the grain the ration will analyze about as follows:

	Protein.	Carbohydrates.	Fat.
20 lbs. corn stover.	.40	6.68	.12
2 lbs. wheat bran.	.25	.88	.06
4 lbs cornmeal...	.27	2.74	.15
4 lbs. gluten meal.	1.36	1.67	.12
Total	2.28	11.97	.45

This will give nutritive ratio of 1:5.7, and the cash outlay for each cow's grain will be 8.11 cents per day. For cows giving the most milk we should increase the gluten, and decrease for those giving a lesser amount. An occasional meal of some other kind of roughage if possible will be appreciated by the cows. For the horses we should give what stover they will clean up, and in addition two quarts each of wheat bran and cornmeal three times daily. At present prices for oats, and having plenty of corn, we should hardly want to buy them. H. G. M.

Connecticut.

CUT THE STALKS.—To feed the average-sized cow in full flow of milk, with plenty of corn and stalks, bran $21, wheat feed $22, and gluten at $30, I should cut up the cornstalks. Place before each cow what she will eat clean; we do not expect they will eat the large, dry stalks; then wet the stalks and put on four quarts bran, 1½ to 2 quarts gluten for each cow. In this way they will eat most of the stover with the grain. We think it a better way than to feed the grain all by itself. The ear corn is not a profitable feed for cows; should surely want the corn on cob ground fine, and then it will not make so very much milk. But the ear corn makes a fine feed for horses. The dent varieties are better than the hard flint for them. Just how much one should feed depends on how much hard work you want them to do. Enough ears of corn to make three pints to two quarts shelled corn, and about the same amount of bran three times a day is a good feed. What this man should do if he expects to make milk right along is to build a round silo to keep his cornstalks. After using one a year he would wonder how he ever got along without one. E. B.

Wilbraham, Mass.

HAY BRICKS.—The Hay, Flour and Feed Journal refers to the need of pressing hay into small compass before shipping for a long ocean voyage. It says that in the South African war horses appeared with what seemed to be bricks strung around their necks. These were really "condensed rations." "A compound of hay, bran and oats is made and pressed until a ton equals but 35 cubic feet. Portions of this compressed material are then placed between iron plates and a tremendous pressure brought to bear upon the plates until the feeding material is of the requisite size of the brick. Clamps are then bound around the plates, and they, with the inclosed bricks, are removed from the press. Then, to overcome the inherent elasticity of the hay, which even after all this pressure would inevitably rebound, the clamped bricks, loaded on a truck, are run into an oven and raised to a moderate heat. This, it has been found, overcomes that difficulty. After being removed from the oven, the clamps are taken off, and the bricks are ready for transportation. These bricks weigh about six to eight pounds each, and measure nine by four inches."

Cure before cost, of course; but besides being a wonderful curative for Throat and Lung diseases. Dr. D. Jayne's Expectorant is about the least expensive remedy; it takes so little of it.—*Adv.*

Daily Rations for Hens.

Have you ever measured the grain feed required by a hen of average size? Various estimates have been made, and we would like to know what the practical poultry-keepers have to say about it. In our experience five ounces of dry grain have given good results as a daily ration.

My hens give better results on a daily ration of five ounces dry grain than when a larger or smaller quantity is given. H. H. C.

Franconia, N. H.

As I keep different breeds of poultry, I have never accurately measured the grain food required daily by the average-sized hen, and therefore cannot advise definitely, although it seems to me five ounces of dry grain as a daily ration is correct, according to your experience.

Delaware, N. J. A. J. M'C.

I cannot give any definite figures. I feed wheat, in the sheaf, to quite an extent, and have never made any attempt to weigh their complete rations for any day or length of time. Making a rough estimate I think it is about four ounces of dry grain daily. I feed some cabbage and clover hay through the Winter, which would make a difference in the grain. GRANT DAVIS.

New Jersey.

I have made two or three estimates and make it a fraction less than five ounces. Twenty-five years ago, when I commenced to keep hens, corn was about $1.45 per bag, bran $21 per ton—those are the only prices that I remember. The cost for grain, shell and everything they ate was—during the Winter—just two cents per hen per week. I feed all the hens—Barred Plymouth Rocks—will eat up clean three times a day.

Hanover, Mass. A. H. M.

Our rule is to feed all the hens will eat up clean, and no more. In several particulars, our method of feeding makes it difficult to form a correct estimate of the grain eaten. In the morning we feed a mash composed largely of small potatoes, turnips and cabbage, boiled up and mixed with bran and animal meal. At noon either a few heads of cabbage, or a little buckwheat is fed, and at about 4.30 P. M. they are given all they will eat of a mixture of wheat screenings and whole corn. The corn is of our own raising, and is fed in an unusual way. The corn is husked and instead of being shelled, is run through a Tornado feed cutter. This shells part of the corn, and cuts the ears, cob and all, up into lengths of about three-quarters inch. The hens have no trouble in picking the kernels from these pieces of cob. This saves us the expense of a sheller, is much quicker, and so far as we can see, is just as satisfactory in its results as any other way of feeding corn. Many of our hens are moulting, and consequently eggs are not as plentiful as we might wish. R. W. R.

Mill Brook, Conn.

I think your estimate of five ounces dry feed per hen too high for economical feeding. I am no poultry specialist, keeping only from 50 to 75. The most practical experiment I have recently made was with a flock of about 60 hens and chickens about equally divided, chickens full grown. I have had them confined in a yard for from six to eight weeks to keep them from my garden, as they were very fond of cabbage and tomatoes. I feed twice per day. Morning four quarts of oats, and at night four quarts of corn. During the day they would usually have a quantity of cabbage or refuse apples or pears, which they needed to get best results from grain. The fowls were contented and kept fat, and young ones increased in weight. They are of the Wyandotte breed. I did not get many eggs in the meantime, as they soon commenced moulting. Seven and one-half pounds of corn and 4½ of oats make a daily ration of 12 pounds or 192 ounces, which gives but little over three ounces per fowl. Had my experiment taken place earlier, expecting egg production, I might have added a little, if not in quantity, in variety; but with the necessary variety of food for the health of the fowls and for eggs, I believe four ounces would be a large daily ration.

Five Corners, N. Y. J. M. C.

Farm Hens in Ohio.

The 125 to 150 B. P. Rocks and White Wyandottes that I usually carry through the Winter have free range, and are divided into three flocks about equally; one at poultry house near the dwelling, one at horse stable, and the third at the large barn where the cattle are kept. The two latter flocks have, of course, abundant scratching facilities, and manage to pick up considerable loose grain. The home flock has scratching material furnished them. They all receive a feed of corn at night. After freezing weather they have warm mash mornings, consisting usually of cooked vegetables with enough bran or ground oats added to take up the extra moisture after mashing the vegetables. They have access to growing rye in pleasant weather. Green bone is fed only occasionally, as it is difficult to procure, aside from the grinding which must be done by hand. Water, shells and grit are, of course, convenient at all times. Surplus cockerels are disposed of or penned separately by January 1. This Winter I shall try about 25 hens and pullets of Buff Wyandottes. So far they have not bred very true, though the eggs from which the start was made were procured from a supposed reliable source. Laying and table qualities, however, show them to be equal to the Barred Rocks and White Wyandottes. M. E.

California, O.

HOLSTEIN AND JERSEY CROSS.

The Two Breeds Do Not "Nick."

Will you tell us whether you consider a cross between a Jersey and a Holstein practical, or is it likely to result in undesirable animals of no distinct type? If this cross were to be made, would you advise the Jersey bull and Holstein cow or vice versa?

A few years ago we tried to use a Jersey bull on our herd of grade Holsteins and grade Durhams, and met with such poor success that we had to abandon that kind of a cross, as the calves were not fit for anything. We also have used a Holstein bull on grade Jerseys with poor results. The breeds are so different that there is nothing common with them, hence the poor results. We are now using Holstein bulls on our grades (Holstein and Durham) the bulls being of the best registered stock, and the calves we are getting are not equaled by anything outside of purebreds found anywhere. We have heard Mr. H. B. Gurler say repeatedly that a Holstein and a Jersey cannot be crossed with any degree of success. H. B. GURLER CO.,

Illinois.

Tie to One Breed.

In my judgment one makes a mistake to cross-breed. Our experience is confined to the use of a single Jersey bull on grade Holstein cows. The heifers are now coming into milk. Their milk on the whole is better than the Holstein milk, and they are persistent milkers, but the flow is lessened. The most disappointing feature of the cross, however, is the lack of uniformity in type and size. We have Holstein heifers, Guernsey heifers, and Jersey heifers, and some not belonging to either class. Classified and put by themselves, they look well enough, and will make very good cows. They do not possess the vitality of the Holsteins, nor are they as large consumers. I do not regret the attempt, because I have been very much interested in studying results, but I would not do so again, nor would I advise anyone else to try it. I am satisfied if the trial is to be made that the Holstein should be the top cross. This idea is drawn from considerable correspondence with breeders during the past three years. I am indebted to S. Hoxie, superintendent of the Holstein Advanced Registry, and to H. B. Gurler, of Illinois, author of "American Dairying," for much valuable information. Mr. Gurler's experience was similar to ours; Mr. Hoxie's observation, that results would be fairly satisfactory with a Holstein as a top cross, owing to the greater vitality. I firmly believe that cross-breeding is a mistake. No one has yet succeeded in fixing the good qualities of each breed in the offspring, and probably they never will. On the contrary, the effect seems to be to intensify their weaknesses. Where one has a mixed herd without special reference to breed, the use of a purebred sire of any breed, if he is prepotent, will have a marked effect and a salutary effect on the young animals. The wise thing to do, it seems to me, is to tie to the breed that meets our demand, and then stick to it. There will be failures enough; we never hear of the blanks that are drawn, and every farmer and breeder gets a share.

H. E. COOK.

Training a Horse.

When I was 16 years of age I went to work for a farmer who had a horse which was continually getting the line below his tail. This he did most when the flies were troublesome. Otherwise the team, of which he was one, were well broken and obedient. The horses that I had used before were not well trained, and one might as well say "fly and dive" as say "haw or gee," but this team would step 12 inches to haw or gee as commanded, so I was very fond of them. The man who had "handled" the team just before I did had jerked the horse when he had the line under his tail, and had the under-surface badly cut. But pulling the line only made the animal worse. He was very kind, so when he got the line into the troublesome place I called him to stop still. I then lifted the tail and took the line gently out. At first, when I did this, he would cringe and make ready to jump, as he expected to get a slap with the lines, but I petted him a little to assure him that I would not hurt him after letting out the line. This continued for about two weeks, when the horse began to walk quietly with the line under his tail, and finally, when he did forget and switch it in he would walk along and shake it out himself. After the animal was cured of the habit the "boss" told me he had been watching to see how I would do with the animal, and complimented me on the success of my patience. I find that 90 per cent of the bad habits in domestic animals are the result of bad temper in those who handle them. The animal does something by nature or chance, and bad temper in some human being fixes the habit in the animal. This is very plainly so in breaking in a young cow to be milked. Have patience with her; don't retaliate, but stick to her and get her milk. Scratch her head and pat the udder, but two or three good kicks and you have gratified your temper but spoiled your cow. This advice I saw in THE R. N.-Y. some time ago and have ever since been grateful for it, as I break in a young cow nearly every year. A. C.

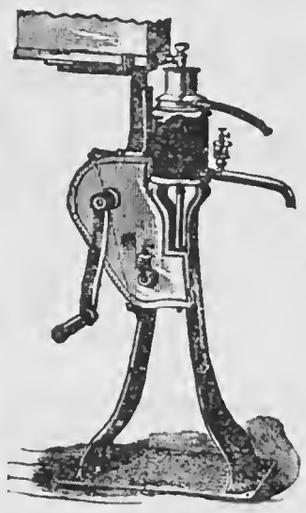
U S U S U S U
UNQUESTIONABLE PROOF
OF THE
EVERY-DAY SUPERIORITY OF
THE IMPROVED U. S. SEPARATOR
"The kind that gets all the cream"


Prof. W. J. Spillman, of the Washington State Experiment Station at Pullman, in an article in the *Ranch and Range*, Seattle, Wash., of August 15, 1901, gives the record of the testing of five samples of milk from dairymen using U. S. Cream Separators.
The five tests were as follows:
.00, .00, .01, .01, .04
An average of .012 of one per cent.
Please notice that in two of the samples the professor could find no fat, and in the poorest one only .04. (Probably this dairyman did not run his separator according to the directions.)
These records show that the U. S. Separator is without a peer in thoroughness of separation.

The Best Christmas Present For So Little Money—$1.75.

THE YOUTH'S COMPANION.

IT is a gift whose beauty and usefulness and power to delight increase as the year goes by, each weekly issue bringing new and fascinating stories, articles on topics of special interest by famous men and women, miscellany, humorous anecdotes and an abundance of other good reading, richly illustrated.

A complete Announcement of the Attractive Features of The Companion's new volume for 1902 will be sent with copies of the paper to any address, Free.

A CHRISTMAS OFFER.

Every New Subscriber who will mention this publication or cut out this slip and send it at once with name and address and $1.75 will receive:

FREE — All the issues of The Companion for the remaining weeks of 1901.
FREE — The Thanksgiving, Christmas and New Year's Double Numbers.
FREE — The Companion Calendar for 1902, lithographed in twelve colors and embossed with gold. CH 172

And The Companion for 52 weeks of 1902,—more than 200 stories, 00 special articles, etc.,—from now until January, 1903, for $1.75.

THE YOUTH'S COMPANION, Boston, Mass.

TORNADO FEED CUTTING Machinery

Up-to-Date in every Detail.

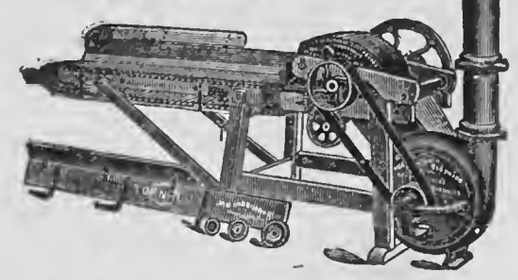
LARGEST LINE

Blowers or Chain Carriers.

FREE SAMPLE of machine's work and Catalogue upon application.

W. R. HARRISON & CO., Mfrs., Massillon, Ohio.

Patent Pending



STEVENS

Anti-friction, Bridge tree, Automatic adjusting, Self-sharpening, Covered gears, Light draft, Non-choking Hand, Sweep, and Power farm mills, for all purposes. Will grind all grain to any degree of fineness. Thousands in daily use everywhere. Send for free catalogue C. Agents wanted.

STEVENS MFG. CO., Fisher Bldg., Chicago, Ill.

There are only two classes of Root Cutters. There is only one in the first class. That one is the

BANNER Root Cutter.

It's the one with the self-feeding, shaking grate—shakes out all dirt, gravel, etc. Saves the knives and makes clean, wholesome stock food. It literally makes ribbons of all roots and vegetables. Prevents all choking. It cuts fast and turns easy. Thousands in use and not a single complaint. We make the Banner in 7 sizes for hand and power. Our **Illustrated Catalogue** tells the whole story. Ask for it. **It's Free.**

O. E. THOMPSON & SONS, Ypsilanti, Mich.

Largest Root Cutter Makers in the World.

ONLY $14.30 for our No. 12 tilting table wood saw, saws any kind of wood. The frame is made of seasoned oak, shaft of cold rolled steel. Castings and wrought iron parts heavy, braced extra well, making it stiff and strong. 95 lb bal. wheel. Pully 6x6 in. Wt. 320 lbs. **We guarantee** this machine to be the best saw frame made. If not found equal in every way to those retailed at $25, return at our expense. Price—24 in. saw **$5.75**; 26 in., **$6.70**; 28 in., **$7.65**; 30 in., **$8.60. Send for our Large Free Catalog,** it shows 8 styles saw machines. All sizes circular saws, lowest prices ever offered.

MARVIN SMITH CO., 55-59 Jefferson St., Chicago, Ills.

NO HUMBUG—3 Perfect Tools In One.

Humane Swine V Stock Marker and Calf Dehorner. Stops swine of all ages from rooting. Makes 48 different ear marks, large or small. No change of blade. Extracts Horns. Testimonials free. Price $1.50, or send $1.00, get it on trial. If it suits, send balance. Pat'd Apr. 23, 1901.

FARMER BRIGHTON, FAIRFIELD, IOWA.

A Little Lantern for a Little Money that gives a Big Light and Big Satifaction is the

DIETZ JUNIOR LANTERN.

COLD BLAST.

It is just a foot in height and weighs but 20 oz., but has all the modern improvements of its larger brothers without any clumsiness. Burns kerosene, one filling lasting 13 hours. Is absolutely safe and wind-proof; can be filled, lighted, regulated and extinguished without removing globe.

$1 buys it direct from us, express prepaid, if your dealer has'nt it.

Our catalogue of lamps and lanterns sent FREE to all on request.

THE VALUE OF A SEEDSMAN'S GUARANTEE

FOUL WEED SEEDS IN GRAIN.

Who Pays for the Damage?

We give below a brief history of an interesting legal case which was tried last Spring in Niagara Co., N. Y. We venture to say that thousands of our readers have before now brought weed seeds to their farms in grain which was not properly cleaned. They will want to know what remedy, if any, there is at law for such damage. We are indebted to D. E. Brong, of Lockport, for the facts in this case.

W. H. Bell owns several farms near Lockport. In the Spring of 1900 he decided to seed a field of 22 acres, part of a farm containing 100 acres, to oats. He received a catalogue from F. B. Mills, a seedsman, and saw therein an account of the "Record Breaker" oats, which were highly praised. Mr. Bell had bought goods of Mills before with general satisfaction. The following statement was printed in the catalogue:

MY GUARANTEE.

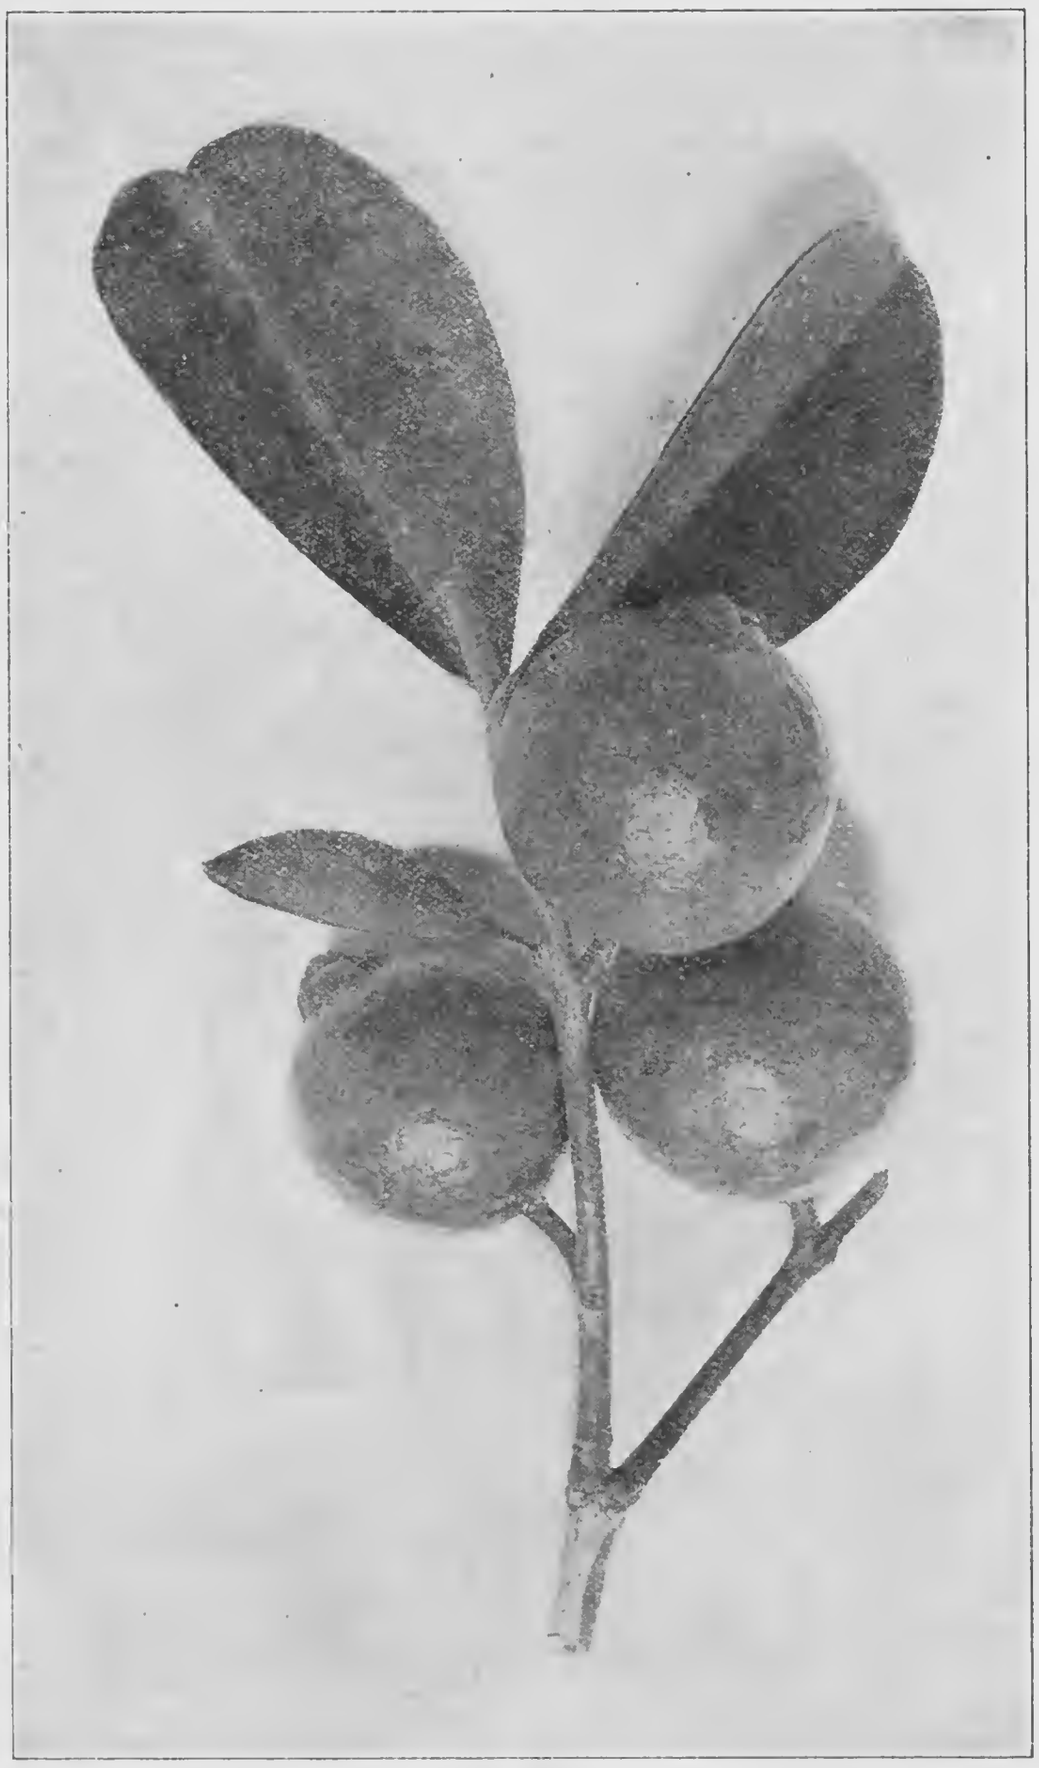
I guarantee that all seeds and other goods sent out from my establishment shall reach the purchaser safe, in good condition, be fresh and true to name, to grow if properly planted, and if such should not prove the case, I will refill the order free of charge, providing sufficient proof is given me within a reasonable time. I cannot guarantee crops and will not be held responsible for them.

After reading this Mr. Bell ordered 60 bushels of the oats—16 of which were for his son. There was so much delay about the delivery of the oats that Mr. Bell was obliged to write and then telegraph for them. They finally came in early May, long after the ground was ready. Mr. Bell hauled them himself from the railroad station, untied the bags, which held three bushels each, and poured half of each bag out into smaller bags so as to have 1½ bushel in each. The bags were then put at distances along the field so as to be handy for drilling. He did this himself, so that he knew that no weed seed got into the oats on his farm. In each bag he found a card which read as follows. He admits that he read this:

I exercise the greatest care to have all my seeds, potatoes, bulbs, plants, etc., fresh, pure, clean and true to name, and if such should not be the case, I will refill the order free of charge providing sufficient proof is given me within a reasonable length of time. I cannot guarantee crops and will not be held responsible for them. If these goods are not accepted on these terms, they must be returned at once. F. B. MILLS.

When the first few bags were opened Mr. Bell and two hired men sampled the oats—that is, they took up a double handful and let them run through their fingers. They were looking at the oats to see if they were plump and clean, and not looking for weed seed. At the trial much was made of this examination. The seedsman's lawyer claimed that if any weed seed had been there a careful examination would have shown it. He claimed that the statement made by Mr. Mills in his catalogue, where he said that the oats were "well cleaned" and the statement made on the card found in the bags, did not amount to a warrant, but that it was left with the farmer to accept or reject the oats as he saw fit after a thorough examination. He claimed in effect that Mr. Bell might have found the weed seed if he had made a proper search for it, and returned the oats without sowing them.

On the other hand, Mr. Bell's lawyer said that the law implies a warranty because a seedsman who has been for years in the business "is supposed to possess superior knowledge on the subject." The purchaser has the right to rely upon this superior knowledge and judgment. Therefore, when the seedsman states that the seeds are clean and pure or "well cleaned," the buyer has a right to rely upon his statement and make but a casual examination. One witness also testified that after the bags had been shipped and handled as these were the little seed would naturally work down, so that a very careful examination of the top of the bag would fail to show them. The judge who tried the case charged the jury that there was an implied warranty in Mills's statement, and it was for the jury to decide whether the farmer gave the oats a fair examination when he took up handfuls and looked at them as they trickled through his fingers.



FRUITS OF CATTLEY GUAVA. Fig. 369. See Page 822

It was so late in the season that Mr. Bell started seeding at once. His hired man drove the drill. When all but about three acres were seeded, the hired man discovered small seed in the oats. He had filled the drill too full, and in scraping the oats back from the cover he found the little black seeds. Mr. Bell was absent, and the hired man used his own judgment and went on seeding. When the owner returned the oats were nearly all in, the last two bouts going in with his consent. Mr. Bell then had some of the oats cleaned and sent the seed to Mills, asking what they were and stating that he was anxious to keep foul stuff out of his farm. To this Mills replied that the seeds looked like turnips, but that he could not see how it could possibly get into the oats, as he was careful to have all grain cleaned. On June 6 Mr. Bell wrote that he was sure that the oats were full of wild mustard. He had tried for years to keep his farm clean, and he felt that he had been damaged. Mr. Mills then sent a man to look at the field, and on his return advised Mr. Bell to hire help at once and pull the mustard out by hand. If proof could be furnished that the weed seeds were in the oats Mills said he would pay for the labor. In the meantime Mr. Bell had consulted with several good farmers, including our old friend, J. S. Woodward. These men found the field alive with the mustard, which was growing in the seed drills with the oats. They showed him the folly of trying to pull 22 acres of mustard by hand, and advised him to plow both oats and mustard under and cultivate frequently. Mr. Bell then consulted a lawyer, who after some correspondence with Mills (who still claimed that the crop could be pulled out) offered to turn the whole field over to Mills to clean in any way he saw fit. If Mills declined this offer Bell proposed to take the best and cheapest means for cleaning the field. To this Mills made no reply, so Bell plowed and cultivated, and finally brought suit for $2,000 damages against Mills.

At the trial Mr. Bell and his hired men told how the oats were bought, examined and drilled; how the mustard came up and how it was plowed under and cultivated. Mr. Woodward and other farmers testified to seeing the mustard, and showed the dangerous character of the plant, and how difficult it is to kill it out. These farmers swore that in their judgment the farm was worth at least $20 an acre less than it was before the mustard seed went into it. The various catalogues, circulars and letters were also put in evidence.

The defence consisted of a long series of objections and a statement by Mr. Mills. His lawyers objected to nearly everything. Every time a witness started to show that wild mustard or other weeds injured a farm the lawyers objected, but were overruled. They also objected when Mr. Woodward and other farmers told the best way of killing weeds. Mr. Mills made a general statement about his seed business. These oats were grown for him by a farmer. Mills himself never saw the sacks, did not personally know what was in them, and could not say that there was not weed seed in them when shipped. He expected the purchaser to examine them, but did not know whether his patrons were competent to detect

weed seeds or not. From his testimony it was not clear that he knew that the oats were really a new variety—or where they came from originally. He had no experience with wild mustard, and did not know how to get rid of it. He had advised pulling it because he knew that would get rid "of all that you pull." On the whole the defence seemed a very lame one—the lawyers evidently thinking that Mills had given no guaranty and therefore that Bell would be non-suited.

The judge, however, charged the jury that Mills had given in his catalogue an implied guaranty that the oats were "free from noxious weed seed that was not discoverable on an examination and inspection." The farmer was bound to give the oats a fair examination, and the jury must decide whether what he did do was fair. The judge also said that if the farmer was entitled to any verdict at all he could claim the value of the seed oats, and also the damage to the farm. The jury finally brought in a verdict for the farmer for $900 and $92.50 costs. The case has been appealed.

We have given full space to this matter because it is an important one to farmers generally. Every year we receive hundreds of complaints from farmers who have received grain and other seeds simply filthy with weeds and trash. These complaints seldom refer to the older and well-established seed houses, but the damage is usually done by the concerns that offer cheap seeds and are most extravagant in their claims for "novelties." Many of these people are mere jobbers, who buy seeds of others, and often sell them to their customers without opening the packages for inspection or recleaning. Several of them have admitted to us when an explanation was demanded that they bought grain or potatoes of some one else, and filled their orders from such bulk lots without even an examination to know whether the varieties were true to name or free from weeds or disease. They merely open the package to put their so-called "guaranty" inside! Such business is a contemptible crime and nothing else, and we rejoice to learn that there is now a legal precedent for action against such people. The trouble is that comparatively few farmers can afford to bring a lawsuit, and fewer still can make out a case as clear and strong as this one was.

It must be said too that farmers themselves are often at fault. They will often hunt for the cheapest seeds they can find, when they must know that the danger of buying weed seed and damaged goods is always increased by doing so. It costs money to clean and test seeds so that they may carry a guaranty that means something. Again, some farmers will wait until the last moment before sending their order. The seedsman is rushed, bad weather sets in, and danger of mistakes and delay is doubled. If when the seeds do finally come, there is anything wrong about them, it is too late to change. Most farmers, too, do not know the different weed seeds by sight. In buying clover seed they are often deceived through their inability to pick out the foul stuff. There is at the National Department of Agriculture at Washington a special department for seed testing. They will take a sample of seeds from any farmer and test it for quality and vitality. They will sort out the weed seeds and tell what per cent of the seeds will sprout. If a farmer will buy his seed early and send a sample of it to Washington for analysis he may know just what he is doing.

A TALK ABOUT FERTILIZERS.

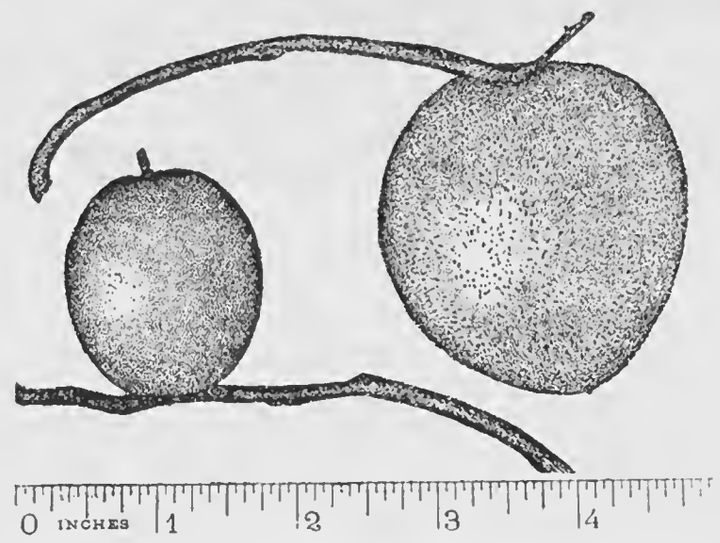
PART II.

Are there any trees, plants, grains, or grasses, that are usually grown by farmers, that show by their condition of growth what plant food they have a surplus of or what they are deficient in? If not, what can be planted as an experimental plant in cultivated crops that would indicate what the soil needed? If the soil is acid, what crop removes this acid more than others? I have heard a strawberry grower say clover always came in the ground profusely where he grew strawberries. Did the strawberries take an acid out of the soil and make it sweeter for clover? Is there not a work on clover and its uses? G. R. L.

West Chester, Pa.

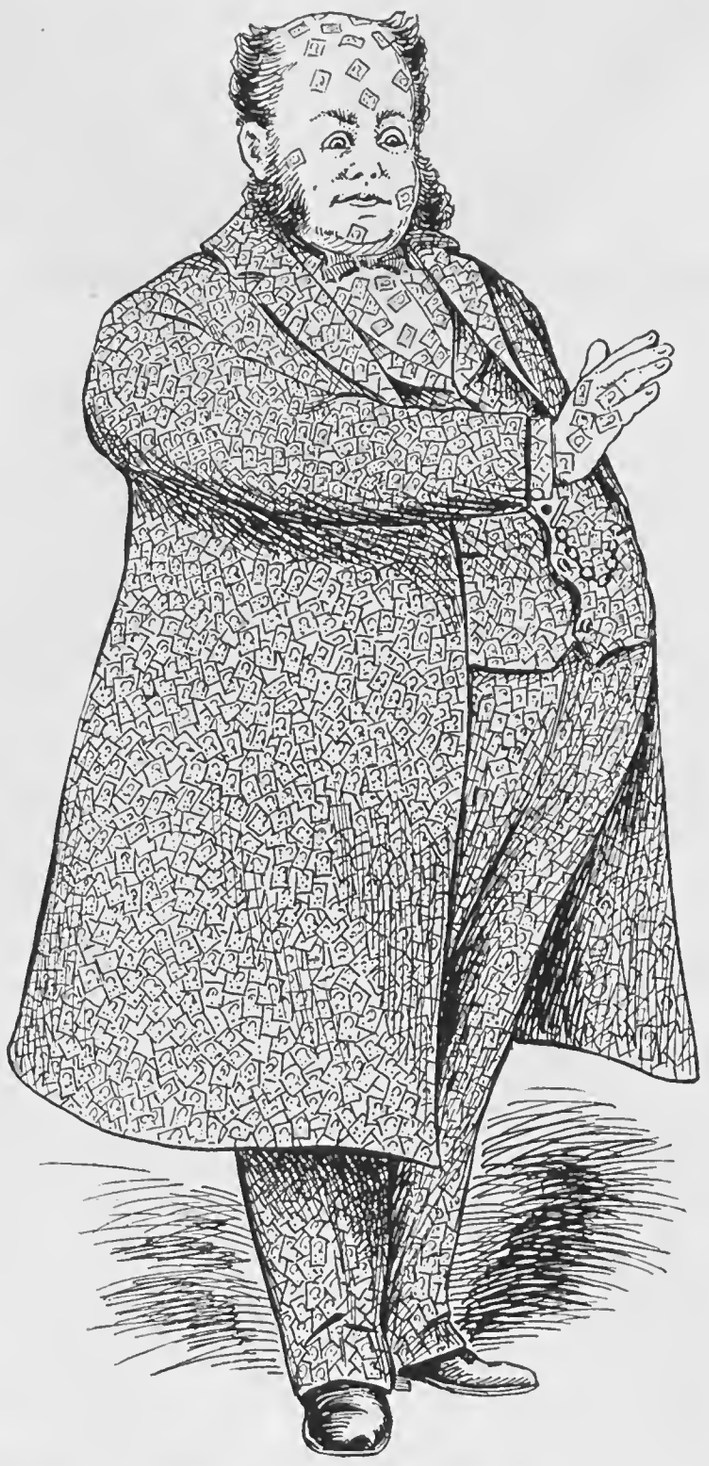
There is no sure way of telling what the soil needs from the growth of different crops. At the Rhode Island Experiment Station many experiments have been made to learn what plants, if any, do best on an acid soil. Lime was carefully used, and close watch was kept to see which crops were benefited by the lime, and which were injured. The list of those which gave a smaller crop when lime was used is most to our purpose. Common white beans, millet, Hungarian, cow peas, radish, carrots, watermelons, pumpkin, sorrel, rye and Red-top grass were the most common crops that seemed to prefer an acid soil. Most other farm and garden crops were helped by liming. Dr. Wheeler says that a test with beet seed will show the soil's need of lime, as the beet quickly responds when lime is added to an acid soil. Two plots or strips are used—each to receive the same fertilizer and preparation. On one strip lime at the rate of 2½ tons per acre is to be used, and beet seed planted in the usual way. If the soil is very sour the beet seed will often germinate, but will not make a full stand or grow properly. This test will indicate a sour soil, but so will the experiment outlined last week. Beets, turnips, cabbage or rape will in like manner show any need of phosphoric acid, but we do not consider such tests equal to the actual use of the fertilizing elements, mentioned last week.

Cranberries are much injured by liming, and blackberries are slightly helped if at all. Strawberries seem to do best on a neutral soil. Lime used when the soil was very sour would doubtless help the crop, but where there was only a small amount of acid it would do more harm than good. Sorrel is found on acid soil, and either disappears or is greatly weakened by liming. Red-top and Rhode Island Bent grass thrive well on acid soils, while Timothy and Kentucky Blue grass do not. This may explain why, in some sour, low fields the Timothy finally runs out and Red-top remains. Prof. Wheeler thinks that this ability of Rhode Island Bent to live on sour soils fully explains why Rhode Island became so celebrated for its grass. The soil being generally acid the other grasses could not succeed, and so the Bent occupied the land. On a natural lime soil other grasses would have crowded it out. Our own experience has been that cow peas do not respond to lime, and we would lime them when plowing under rather than when seeding. We have no evidence to show that a crop like cranberries or strawberries will "take an acid out of the soil" and thus leave it in better condition for clover seeding. Clover sometimes grows as a volunteer crop after lime or wood ashes are used. The explanation of this is that the clover seed remained in the soil for several years not germinating because the soil was too acid. When this acid was neutralized by the lime or ashes the seed sprouted and grew. The same explanation might be given for the appearance of the clover after strawberries. This berry usually receives a good quantity of stable manure plowed in before the plants are set or used for a Winter mulch. Manure is alkaline, and, when plowed into a sour soil would very likely fit it so that the clover will start. A little book by Henry Wallace, of Iowa, discusses clover culture in a very readable way.



SUPPOSED JUGLANS—HICORIA HYBRID NUT. FIG. 370.

See Page 822.



WELL PASTED WITH POSTAGE STAMPS. FIG. 371.

THE NORTHERN SPY FOR TOP-WORKING.

The experts often say that the Northern Spy apple gives the best stock for top-working other varieties. The reasons for this claim are not often explained, and the following article by Geo. T. Powell will be peculiarly interesting to many of our readers:

Nine years ago I began growing the King apple by selecting buds from strong individual trees and top-working them on Spy trees. The King is a weak tree constitutionally, is easily attacked by canker, and is short-lived, but when grown in this manner it gives promise of being a very profitable variety. The manner in which I arrived at this process of propagation was this: In pruning different kinds of trees in the orchard I found the King, Greening, Baldwin and other varieties cut easily, but when the Spy rows were reached it was very different work. The wood cut much harder. It seemed like cutting steel, the wood was so hard and fine grained. From this I reasoned that the Spy would be a valuable stock to work the King upon, as its vigor and freedom from disease might influence the scion when worked upon it. I feel quite sure that this will be the result, as thus far no Apple canker has appeared upon the King.

Believing there would be value in selecting buds with reference to individuality, I sent to Tompkins County for buds from the best trees to be found, that were not only free from disease, but that produced fine fruit, bore annually, and showed in every way superiority. The Spy does have a much stronger root system. The roots run deeper, and they are far more numerous. Colonel Evans, of the Olden fruit farm of Missouri, has also top-worked extensively on the Spy, and the strong root system was what led him to use this variety. He found in plowing out rejected trees in nursery blocks that one mule could plow out all other varieties readily, but when the Spy blocks were reached it took two to plow those out. I am planting only upon this principle, and have Jonathans top-worked but three years that bore fine specimens of that choice variety the present season.

GEO. T. POWELL.

TWO INSECT FRIENDS FROM ABROAD.

On entering the office of Dr. L. O. Howard, Chief Entomologist of the United States Department of Agriculture, recently, he said to me: "You know that it is said, that it never rains but it pours, and this seems to be true of our insect friends from abroad just now." Only two days before news came from China of the finding of the parasite of the San José scale, and now we have two importations from Europe in one day, November 18, of the present year, of parasites of more of our enemies belonging to the insect world. There is an insect known as the Black scale, that has for ages been one of the chief enemies of the olive in Italy, France and Spain, and it has been brought to America and is at present the principal obstacle to the culture of the olive in California. It also is a pest upon oleander plants in greenhouses. There is a little moth in Europe, known by the scientific name of Erastria scitula, which is a persistent enemy of the Black scale. Its larva, or the grub stage of this moth, eats its way under the scales and literally devours the minute insects that live there, and suck the sap of the olive trees, thus destroying them. Its introduction in America has often been attempted before, but in every case those little friends have died before arrival. This time they came in excellent condition, and are now in the insectary at Washington, D. C., in the larval or grub state, and will be promptly forwarded to California. In fact, one lot was sent there the next day after arriving in Washington. Other shipments will follow, and there is every reason to expect that this tiny friend of the olive growers, and of those who love the culture of oleander bushes, will soon be well established in America.

Another friend of the gardener and farmer has the distinction of arriving in healthy condition from Europe the same day, November 18. This is a species of ladybird beetle known as Coccinella septempunctata. It preys upon the larva of the Asparagus beetle; the latter being a very annoying and difficult enemy to fight. This parasite of the Asparagus beetle also destroys the Grain plant-louse that has done serious damage to the wheat fields of Texas the past year, and that is occasionally destructive to the wheat crop elsewhere. It was never before possible to get anyone to hunt this parasite out in Europe and send it over, but now it is here in perfect condition. It will be especially welcome to the asparagus growers, who are often sorely troubled by the beetle that defoliates their crops. This importation will be followed from time to time by others from the same source.

H. E. VAN DEMAN.

A WOMAN AND HER HENS.

Success with Farm Poultry.

On page 747 Mrs. Howard Smith, of Connecticut, gave some advice to girls, and mentioned poultry keeping as a source of income. She has now prepared the following full statement:

My hen house is a cheap affair, not costing over $15 when new, 12 or 15 years ago, but it is a good warm one, built of plain rough chestnut boards, two thicknesses of boards with building paper between, with a good cement floor. I use kerosene oil on roost poles and around the nests, so I never have any lice to bother with. My breed of poultry is nearly pure-bred White Wyandottes, as I have sent away to get good cockerels of that breed for a number of years, keeping my own hatched pullets, and I now have a beautiful flock of them. One can get good cockerels from the fancy breeders, not the prize winners, but good ones for $1.50 to $2 each. I have just received two good ones hatched in April for $4.

I never keep my hens shut up. They have the full range of the farm, but we put wire netting around the garden to keep them out of that, unless in Winter; when we are having a really bad snowstorm, I keep them shut in their house till it is over. There is a large open shed next to the henhouse, where my husband stores his farming tools, and the hens have that to get under in bad weather, and there is where I feed them in cold weather. My feeding in the morning is two quarts of wheat (I get what is called No. 2 wheat at $1.10 a bag, called 100 pounds), and one quart of oats that have been soaked in water 24 hours; feed that hot in cold weather. At noon I give them one quart of dry wheat scattered under this shed to keep them busy scratching, when the weather is bad, so they cannot get out to range. At night all the corn they will eat up clean. I feed well, so I can kill them at any time I have a market for them, or to use in the family; the chickens I feed four times a day with wheat and cracked corn. I soak that in curd and whey, sour milk curded, heated on the stove. I turn off most of the watery part and mix the thick curd with the chicks' feed. There is nothing that will make chicks grow like it. I try to hatch about 50 to 75 chicks the last week in March, or the first part of April; that is all I can give good warm quarters to, as the little chicks' house is small. I hatch by hens, and raise them by hens; make one hen take all the chicks that two hens hatch; that is, if she can cover them well. These early chicks I sell for broilers in June; they will weigh two or 2½ pounds by that time, and I get 50 cents each for all I can hatch. The buyers come to the house after them. The later ones I save, the pullets for my own use, and for some customers who come every year to replenish their flocks.

I do not hatch any chicks after May, as I do not like late ones. The little roosters I kill, or sell alive, and eat them in the family when wanted. My number is about 150 chicks each year; not a large flock. I do not believe in old hens, but do keep 12 or 15 till they are two years old, never any longer. I get rid of them before they begin to moult, the latter part of the Summer, and stock up with the pullets. I keep from 30 to 35 hens and pullets and two cockerels. I keep oyster shells by them all the time, give them warm water in Winter, also a basket of hayseed and rubbish off the barn floor, to scratch and peck over every few days. In bad weather in Winter you must keep them happy and busy if you expect to get any eggs from them. If I have it to spare in Winter I curd the sour milk and give the thick part to the hens. Last Winter I gave them some every day for three months, and how they did lay! I am getting now only eight or 10 a day; my flock is 12 hens that are one year old and 18 pullets. I do not keep a large flock, as my henhouse is small, and if you crowd them they will not do well. One year I kept 45, but did not get so many eggs from them as I did from the smaller number. Table scraps and vegetable peelings cooked are good for them if you have them, but on a farm there are dogs, cats and pigs to take them. Be on good terms with your flock, watch them, and study their wants, and they will pay you back with a good will. This is my statement for 1900:

DR.	
27 bags corn, two bushels in bag	$26.00
800 pounds No. 2 wheat	8.90
800 lbs. cracked corn	8.40
300 lbs. oats	3.87
1 bag oyster shells	.75
2 cockerels	3.50
Total	$51.42

CR.	
237 dozen eggs, 17 to 35c. a dozen	$62.89
68 pounds hens, 18 to 20c. a lb.	10.75
69½ lbs. chicks, 20 to 25c. a lb.	15.08
24 chicks alive, at 50c.	12.00
45 pullets at 60 to 75c. each	30.35
3 cockerels	3.00
Total	$134.07
Profit	$82.65

I make no account of what eggs and poultry I use in the family of four or five, as I set that down against the trouble in caring for them, and I think the poultry work the easiest of all the work I have to do.

MRS. HOWARD SMITH.

NOTES ON OLD AND NEW FEEDS.

It is a little strange, and hardly understandable, to find in one creamery that the feeding of cotton-seed meal is strictly prohibited, and detective measures used lest some farmer slide in a bag once in a while unawares. Not a great distance from this creamery is another whose butter is sold in the same market, and at the same price as the first, where the feeding of cotton-seed meal is encouraged, and the manager buys it for his patrons by the carload, furnishing it at the wholesale price. The latter creamery buys all kinds of feed for its patrons, helping them in every way possible to reduce the cost of the milk, and to increase the patrons' income.

We have never known of so many auctions of farm stock and utensils as have been held this Fall. High price of both coarse and concentrated feed, and low price for dairy products, have discouraged many farmers. Seven dollars per ton seems a pretty fair price for a feed containing only 18 pounds crude protein and 174 pounds carbohydrates. Yet we were offered such a bargain yesterday by a man representing a firm located in the New York Produce Exchange, sugar beet feed, otherwise known as beet pulp, refuse from manufacture of sugar from beets. It contains 10 per cent dry matter or about 160 pounds digestible matter in a ton; less than one per cent crude protein, no fat, and 8.7 per cent carbohydrates. When this man introduced himself as offering a new feed our first question was its analysis, and he replied he didn't know. He said he had never been asked that question before. We found he had been selling this feed for seven weeks, and his stock in trade consisted of a smooth tongue and a carefully edited eight-page pamphlet loaded with testimonials, but telling nothing as to the composition of the feed. We took him into the house, showed him the analysis, and read to him a few paragraphs from Dr. Jordan's book on "The Feeding of Animals," where beet pulp is given a value "about half that of silage, and that full-grown animals will consume 100 pounds daily" (35 cents per day). What an economical ration this year when feeds are high! We found out that he had sold a number of carloads to Connecticut Yankees, and had orders to stay in Connecticut until he had the feed firmly established. We must confess we are sorry for the dairyman who parts with hard-earned cash for such a feed at such a price. The retail price of this feed is $7 per ton; price to *one* dealer in a town $5.50 per ton. Unless farmers are near enough to the factory so that this feed can be bought at an expense not greater than $1.25 per ton we should let it alone.

A YOKE OF PUREBRED JERSEY OXEN. Fig. 372. See Page 830.

CORN FODDER FOR SHEEP.

We have fed cornstalks for years, and consider them as indispensable as hay. We find them especially useful for sheep when we do not have clover hay, and as a part ration with Timothy hay they have no equal. We would say that they are best for sheep and cattle, but are also good fodder for horses. Their usefulness depends much upon the time of cutting, curing and the method of feeding. To get the best results the stalks should be cut about the time that the grain is beginning to glaze nicely, but we have had excellent results also in their use, when we wanted the crop of corn as well. In this case, we cut them when the grain has all or nearly all dented, shock immediately, and let them cure. They do better when cut with one of the corn binders, such as are now found in all the markets. As to the method of feeding, much will depend upon the conditions and circumstances of the surroundings. We feed shredded or thrashed, having long since given up the idea of feeding them in natural form. When shredded or thrashed, much more of the stalk is eaten, and, therefore, it goes further and is cheaper. The refuse is still on hand, but it makes good bedding, then the best of manure, and is easily handled. Fed in this way then, it first serves an economical purpose as food, next as bedding, and finally as a by-product, the value of which must not be forgotten. Thus all the problems of handling and feeding are readily solved. The next question solves itself, for its storage capacity is so reduced that the question is scarcely to be considered.

We have had excellent results in feeding oats with corn fodder, and I find that a good many are feeding the corn itself with it with good results. If it can be had without too much extra cost, one feed a day of Timothy and clover hay mixed would help its use wonderfully. Sheep do not like to be fed on all one thing, but thrive best on a variety of foods. When the feed can be varied, I would suggest that bran and oats make a splendid feed. One feed a day of roots is beneficial. A friend, who is feeding 6,000 sheep this Winter, is feeding the corn on the stalk, just as it comes from the field, supplementing with oats for a change of grain. If help is high, and the fodder can be fed in an open field where the greater portion can be used without much loss, it may pay to feed without shredding or thrashing, but we could never succeed in its use in this way. Again, if an attempt is made to use the manure when fed in this way, the feeder will meet with serious difficulties which will probably discourage him in the use of it. Considering corn an average crop with help at the ordinary price, we would say that corn fodder is an indispensable feed for sheep, cattle and horses. When fed shredded or thrashed, it goes further, is more easily stored, better handled, and we think becomes better feed. It can be fed with almost any grain, but for sheep, we would suggest oats and bran. Taken from an economical standpoint, corn fodder is one of the cheapest forage plants, and when the American people have learned this, one of the great problems in cheap, coarse feeds will be solved.

Fillmore Co., Minn. JOHN C. MILLS.

SMALL COW PEA START.—Last Spring I bought a five-cent package of Warren's Extra Early cow peas, and they were planted on a high sandy knoll. They made a wonderful growth, and ripened a large quantity of seed. On one side of them were planted white beans (marrow, I think); on the other Soy beans. All did well, but no nodules could be found on the roots of the white or Soy beans, while the roots of the cow peas were full of the largest nodules I ever saw. The ground was seeded to clover and Timothy which looks fine now, and I shall watch next Summer to see whether there is any difference where the beans were. MARVIN FELLOWS.

Colorado.

THE DILUTION "SEPARATORS."—I was very much interested in the article in regard to the so-called water separators signed by E. D. R., and what H. E. Cook says about the dilution system. I have used an Aquatic cream separator three years; have never had to pay one penny for repairs. The first cost was $10. The cost of the centrifugal separator and power to run the same, either oil, gasoline or horse, will be about $350. The expense to run any of these powers is no small amount; then the extra work added would more than offset the small amount of butter fat which H. E. Cook says is left in the milk. He also says that the chief disadvantage of the dilution is spoiling the skim-milk. I have raised 10 calves each year that are worth, when five months old, $10 each; feed only the separator milk, and what feed they get in the calf pasture. The difference in the cost of the two separators and the power to run them and keep them in repair would more than balance the butter fat that H. E. Cook claims is left in the milk.

FARMERS' CLUB

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

The Mann Apple and Persian Walnuts.

C. A. H., Ringtown, Pa.—1. I have a block of Mann apple trees and I noticed some time since that you are not a very strong advocate of the variety. What are its faults, and would you advise me to top-graft my trees to some other sort? My trees are four years planted, but have not borne any fruit yet. They are about four inches in diameter. 2. Will Persian and Japan walnuts and peeans grow in our climate?

ANS.—1. The objections to the Mann apple are, as I see them, that it is usually very dull and unattractive in color, rather poor in quality, except where the conditions are very favorable for its full development, and it is not entirely satisfactory as a bearer. I would not advise top-grafting a small lot of the trees of this variety in Pennsylvania, but if there are many I would work over the greater part to Grimes and Rome Beauty. 2. Yes, the hardier varieties of the Persian walnut will grow and bear in Pennsylvania. There are trees now in good and productive condition in western New York and even farther north. But most varieties are too tender for those regions. The hardy ones are chance seedlings. The Japan walnuts are all hardy. Only the type called Cordiformis is valuable for its nuts. The northern types of the pecan are hardy, but those from the regions near the Gulf of Mexico are too tender.

H. E. V. D.

Fruits for Central New York.

W. H. L., Dunnsville, N. Y.—I am to set 500 apple trees next Spring, as follows: 200 York Imperial, 150 Baldwin, 50 Grimes Golden and 50 Arkansas or Mammoth Blacktwig. I can get them from a nursery in Pennsylvania for 10 cents, for three to four-foot size. I wanted 50 Rome Beauty, but they would not sell so many at that price, but offered Ben Davis instead. That apple will not sell in my market, which is Schenectady. Would you advise any other or different collection for this part of the State? I know the Baldwin does well, as I have 100 trees bearing; sold my apples all at $3 per barrel, both first and second grades, and retained the Esopus, which I sold in the local market at $4.50 for the firsts and $3 for the seconds.

ANS.—While York Imperial is a very good apple for many parts of the country, it has not been sufficiently tested in New York to warrant planting it largely. The time may come when it will be safe to plant orchards of it there, but I would not now advise anyone to do so. My main doubt regarding York Imperial in New York State is that it may not develop to a sufficient degree. Samples that I have seen grown in that State have not been so large as I had hoped to see, but some from Michigan that were at the Pan-American fruit show were much better, and it may be that when more trials have been made my opinion will change more in its favor. Specimens of York Imperial shown at Buffalo, N. Y., from Nova Scotia this Fall were larger than I had expected. It is a perplexing question to settle, when it comes to deciding what Winter apples to plant in any section, and central New York is no exception. Baldwin has long been the leading market variety for that region, but it has faults that make it desirable to find something better to plant. Sutton may be one that is more desirable. It surely is better in quality and of about the same size and color as Baldwin. Jonathan is still better in quality, more highly colored and a good bearer, but it may not be large enough for market when grown there. However, I think it will be of sufficient size, and would advise its trial in a moderate way. Grimes is of most superior quality, rich yellow color and fair size. It is well worth planting, for it already has been sufficiently tried in New York to prove that it is a good Winter apple, and will sell at a good price in the fancy markets. Rome Beauty is good for that region, and if trees of it cannot be obtained at one place they can at another. Arkansas is a new variety that is of doubtful value in New York. It is a seedling of Winesap that is larger but not so good in quality nor so bright red, but rather dull in color. Ben Davis made a far better showing in the New York exhibit at the Pan-American Exposition, and I was really sorry to see it, because we should encourage the growing of better apples. As H. E. Dosch, of Oregon, says of it: "Wherever we find Ben Davis it always has that delightful sawdust flavor," and this is even more true of it in New York than in the South and West. I cannot agree to the planting of Ben Davis in New York, although there may be money in it. Why not plant Esopus (Spitzenberg) which is one of the best of apples? With the use of modern help in the way of spraying it can be grown as well as in the days when fungus diseases and insects were rarely troublesome.

H. E. VAN DEMAN.

Fruits for Connecticut.

J. J. F., Rockville, Conn.—I intend planting about 125 apple trees next Spring, and about 50 pears, standard. Will you advise me what varieties to plant, and about in what proportion? I want to grow both apples and pears for market, but want them to be first quality, so if a purchaser buys once he will buy again. I want quite a few pears for Fall and Winter, to be planted in northeastern Connecticut; apples to be mostly all Winter varieties, and not too many kinds.

ANS.—I would name Baldwin, Sutton and Rhode Island Greening as Winter apples, and Hurlbut and McIntosh for late Fall. All very good in this section. I should use about one-third each of first two named, and make up the other third of the rest. As to pears, Bartlett and Anjou would be used, to which should be added Bosc if top-grafted trees can be obtained. Where mere profit is considered the Kieffer will come in, for it bears very young, gives large crops, and as yet sells well.

A. G. GULLEY.
Conn. Ag'l College.

Mr. Hitchings and His Orchard.

F. P. B., Dyer, Mass.—I am very much interested in the article on Grant Hitchings's orchard. Will you explain his method in full, from the time he puts the young tree into the ground? Does he set the trees in grass land? How does he fertilize? Do you think it is possible to use the same method on all kinds of land? I have a side hill with fruit on it that washes badly, and I would like to try his way.

REPLY BY GRANT M. HITCHINGS.

The best possible place to set a young orchard is in soil well filled with decaying vegetable matter or humus. If you will examine the soil in a field that has been used as a pasture for a number of years, you will find it in a very mellow and fine condition. This is just right for an apple tree to do its best in, provided you mulch it over its roots so that the moisture will not dry out until its roots are well established. The next best place is in a new seeding of one-third clover, one-third Timothy and one-third Red-top, 12 quarts to the acre. Mulch trees with straw when first set until grass is large enough to mow; then place what grows in orchard around trees, gradually extending as trees grow, until 10 years old; then let lie where cut. By doing this you soon get the ideal condition of looseness of soil and abundance of humus that tells so favorably in fruit production. After a few years the Red-top takes the place of the other grasses, and it makes a fine aftermath that covers the ground like a carpet. You notice by this method that you grow humus in the Spring, which checks excessive wood growth of trees, and that it decays during the Fall which stimulates fruit-bud formation; also that it is a very cheap method, requiring no fertilizers. Experts have told me that it was my soil that caused the results, but this same soil when cultivated for grain only showed ordinary results. My soil is a quite heavy clay loam, and would wash badly if cultivated. I have faith enough in the method so that I shall treat all kinds of fruit trees the same. But just how it will act in other soils and locations must be ascertained by trial.

Water and Stone Lime.

H. S., Pattenburg, N. J.—What is the difference between water lime and stone lime to mix with skim-milk for paint?

ANS.—As most readers know "lime" is obtained by burning limestone. The heat drives off carbon dioxide and leaves oxide of calcium, which is "lime." Some limestones contain a certain amount of clay. When they are burned this clay remains with the lime, and will "set" or form a hard cement under water. Such limestones are called hydraulic and the lime burned from them is hydraulic or water lime.

When to Plant Cow Peas.

L. E. W., Eden, N. Y.—Are cow peas a crop that will stand the Winter? I ask this question after reading what J. T. C. says on page 755. I am ignorant in regard to anything of this sort, because they have not been raised in this locality. We grow a large number of acres of peas for the canning companies here, and after the earliest are picked we plow the vines under and plant potatoes. In all accounts that I have read in THE R. N.-Y. eastern farmers cultivate their peas, an unheard-of thing here. We sow ours with either a 10 or 11-hoed drill, using every hoe, as we would with grain. If the cow peas are sown in April, as we sow other peas here, would they get large enough to plow under for potatoes by the middle of June? I have been in the habit of sowing rye in September and plowing that down for potatoes in June, but I have read so much of late in regard to cow peas that I think I would like to try them if it will not take too long for them to grow. What we want here is some quick catch crop to take the place of manure, because we do not keep stock enough, and have no faith in commercial fertilizers.

ANS.—We have tried to make it plain that the cow pea is a tender plant—just as liable to be killed by the frost as garden beans. They die at the first hard frost, and cannot be planted in April like field peas or canning peas. They should be planted just after corn. They make a quick growth, but occupy the land during June, July and August. They may be sown after wheat, rye or oats, and make a fair growth, but for the best results they should have the whole season to grow in. We do not see just where you could use them to advantage since your canning peas give you a good crop for plowing under. We recommend them especially for poor or "worn-out" fields which are not productive, and for which there is little manure or fertilizer. In such fields the cow pea will usually make a fair growth of vine, and if this is plowed under, the field will give about as much rye or corn as would be grown after a fair dressing of manure. The proper place for the cow pea, at the North, is on these poor fields. We would not plant it in a field already rich enough to grow a fair crop of corn, and *we do not advise its use as a forage plant.*

EVERYBODY'S GARDEN.

QUESTIONS FROM A BEGINNER.—We are glad to use the following extracts from a letter received as a text from which to answer some questions which doubtless are facing many more at the present time, and the helps here suggested will aid in solving some of the many problems constantly looming up before us. The questioner's lot is simply the common lot of all. G. H. T., Bloomington, Ind., writes:

I commenced gardening last year, but with poor seed and drought have almost failed. I am depending on our village of 6,000 inhabitants (State University), for a market, with close competition. I wish to grow only what I can handle myself, using no help regularly.

A more careful statement of some particular conditions, as to soil, distance to market, whether depending on the open or private market, etc., would assist much in pointing out more definite helps. But general conditions can to some extent be answered. The drought was of itself a sufficient source of discouragement, but in general can be met only with the best of soil and cultural conditions, and where irrigation is not practical or is not followed, they are the only remedies at hand. Liberal fertilizing, good seed, early and well planted, with thorough tillage before and after planting, will to a great extent mitigate the dangers from the drought. But one of the most thoroughly disgusting and disheartening things to be met in all the field of horticulture is worthless seed, and no amount of fertilizing and culture will repair the damage. Some remedies have heretofore been pointed out in these columns, such as seed selection and plant breeding, and should be preserved for future reference. The immediate relief, however, is through some of the many reliable seed firms who advertise in THE R. N.-Y. A request by postal card will bring their catalogue, and many if not all can be relied upon for thoroughly good seeds.

CLOSE COMPETITION.—This we must all face, for there is now no getting away from it, and it must be met first by cheap production, remembering that profit comes only after the cost of production is deducted. Second, by early crops as to season, and superlatively best as to quality. These conditions will invariably create demand and correspondingly high prices. Third, by the very best of soil conditions with intensive culture. Make one acre if possible yield double the former product, and the cost will be but little in excess of the old half-crop culture. The foregoing rules will as nearly as possible solve the problem of competition.

I of course want the best paying crops, yet want to plant a succession, so I will have something all the season, and not be overstocked at other periods. I think it would suit me better to raise crops that take the least time to market.

Referring to the first proposition, it would be entirely problematical to one living so much farther north. Your seasons should be at least three weeks longer than in our location, and the safest advice is to study your market and its demands. For one with little experience, the wiser way will be to select crops of which you have some knowledge, and which you know will succeed well in your locality, and for the time being to do *special* rather than general gardening. A general line requires so much more time in producing and preparing for the market that this will be the wiser plan to start with, and let the more general work come as experience and market demand shall indicate. By a careful study of the markets and your ability to handle the work, successions will to a great extent suggest themselves. The root crops, potatoes excepted, will as a general rule require more work in producing and preparing for market than peas, beans, corn and other crops that require no hand weeding in growing or washing and bunching for the market. Some of the former will have to be grown in order to keep up a supply, but of these select what in your judgment will be the most available. Hotbeds and cold frames with plant protectors will be of great service in meeting the question of competition, but start in a small way at first with always a view to enlarging as experience comes.

MARKETING.—When the season for marketing approaches and you are reasonably certain as to what you will be able to supply, search out your customers. As to general or private markets, I have found the latter most satisfactory, and far more stable as to prices. Cater only for the best trade of the city, and resolve to furnish strictly gilt-edge goods, put up in the finest possible shape, and do not be bashful in asking and expecting gilt-edge prices. Reach your customers through a personal letter, stating what you can furnish, their quality and when you can deliver. If the very best quality of products with promptness and regularity can be relied on, your customers will soon learn to expect you and be glad for your coming, and by soliciting orders for future delivery the trade will soon be so well established that the uncertainty of market day will be reduced to the minimum.

"How much land can I tend, and how shall I arrange it that I may get two crops off a portion of it at least?" The first question will depend almost entirely upon the kind of crops grown and the facilities for rapid work. Small crops requiring hand weeding will require much more time than crops which can be cared for by hand tools and horse power. Study these matters carefully before beginning, as they will figure largely one way or the other in cost of production. Early sweet corn, peas, early potatoes, etc., may be succeeded by celery, late cabbage, butter beans and late beets or even carrots. Parsnips, late beets, salsify, etc., ought, in your country, to follow safely after early spinach, extra early peas and beans. But better to sow cow peas, Crimson clover, rye, etc., to plow down than double crop too much. These general rules, if followed, will, I hope, lead to some degree of success, although some failures must be looked for. Others doubtless are vexed with these, or similar questions, and the difficulties once known I shall be glad to help in removing them.

FROZEN RHUBARB ROOTS.—Quoting from a contemporary, "With asparagus and rhubarb roots there is no forcing without previous freezing." This is an entirely mistaken idea, as my successful crops are grown without it. True, the roots require a different method of handling, but very fine crops are grown without freezing, and by this means can be placed on the market before the crop can by any means be forced from frozen roots. This process, however, is very exhausting and kills the roots, but the gilt-edge prices fully compensate for their loss. Both methods are clearly and distinctively treated of in "The New Rhubarb Culture," for sale by THE R. N.-Y., price 50 cents. J. E. MORSE.

Michigan.

Naphtha for Grain Insects.

Several Readers.—It is reported in a Kansas Station bulletin that naphtha may be substituted for bisulphide of carbon in killing insects in stored grain. Is this correct?

ANS.—I have not seen the recommendations in the Kansas bulletin, and do not recall any records of careful tests of gasoline for killing stored grain pests. But an authority on such questions says: "Benzine and naphtha or gasoline are of some value as fumigants for some materials, but do not produce entirely satisfactory results with grain, their vapors being insufficient for the destruction of the adolescent stages of species which breed wholly within the kernel, while each of these reagents possesses an offensive and more or less persistent odor. They are open, moreover, to the same objections as bisulphide of carbon, the vapor being about equally inflammable and more explosive." M. V. SLINGERLAND.

SAVES WORK AND TIME

For close skimming and quiet and easy running the National Hand Separator has no equal among hand separators. We are ready to prove this at your home by sending a

NATIONAL CREAM SEPARATOR

anywhere on 10 days' free trial, to be placed in competition, if you like, with any other separator. If it don't back up every claim we make you can return it at once at our expense. Prices astonishingly low. For particulars, write to

Ruralisms

NOTES FROM THE RURAL GROUNDS.

DESIRABLE NEW CANNAS.—Seven new Cannas were received in May from J. C. Vaughan, Chicago, Ill. Varieties of both European and home origin seem to have been included in the collection. They were established in pots under glass and planted out early in June. The soil and cultivation was favorable for Cannas, while abundant Summer rain gave them a good chance to develop.

DAVID HARUM; over four feet high. Good bronzy foliage, flowers rather small, but very numerous, borne in branching spikes well above foliage; orange scarlet in color. Makes a good appearance all through the season. Foliage has a fine spreading habit.

RED INDIAN; four feet, large purplish-bronze foliage, medium sized blood-red flowers, standing up well on profusely branching spikes. A fine variety but suffered more from storms than some others.

N. JARRY DESLOGES; 4½ feet. Large, tough green leaves, good-sized scarlet flowers in rather narrow stiff spike. Comparatively a shy bloomer.

L. PATRY; four to five feet, medium flowers, of flimsy make-up, rather scattering and partly covered with the upright green foliage; salmon scarlet in color.

DWARF FLORENCE VAUGHAN; similar to the well-known tall variety of that name, but very dwarf, scarcely reaching three feet. Foliage very green and glossy. The yellow, crimson-spotted flowers are freely produced and carried well, but a little too near the foliage. A valuable sort where a dwarf Canna is wanted.

VICTORY; three to four feet; fine broad tough green foliage, handsome in form. Good large trusses of scarlet flowers with satiny finish, mottled and bordered with yellow. Seems to have characteristics of the orchid-flowering section. A profuse bloomer, and to our taste, the best Canna of the lot.

SOUVENIR DE MME. DE NARDY; seven to eight feet, large green foliage but with a slender effect from its height. Makes a huge clump; flowers carried high up, and none too profuse; scarlet, spotted with lemon yellow. It will be noticed that the best varieties of this collection do not have the longest foreign names.

A NEGLECTED TROPICAL FRUIT.—One of the most common and neglected fruits of warm climates is the guava, scarcely known to northern residents except as the base of guava jelly, a delicacy imported from tropical countries. The species producing edible fruits form small shrubby trees with handsome laurel-like evergreen foliage, and are found growing abundantly in thickets about inhabited places in tropical and even sub-tropical America. Though native to this continent guavas are now quite abundantly naturalized in warm places in Asia and in South Africa. The most common species, Psidium pyriferum, bears abundantly small pear-shaped fruits, of a russet yellow when ripe, containing a pinkish pulp in which are embedded many flat bony seeds. It is the source of the guava jelly of the West Indies which has been an article of commerce almost since the time of Columbus. The guava is one of the few tropical fruits containing enough pectin to make a firm jelly. As found in fancy groceries it has a pleasant but scarcely a distinctive flavor, though the raw fruits are agreeably acid, and have a quality that greatly improves on long acquaintance. Guavas are easily raised from seeds, suckers and cuttings, and often begin bearing when two years old. The flowers are of good size, white with a greenish tinge, and contain many curiously twisted stamens, and are so numerous as almost to cover the plants. The trees grow so readily and persistently in tropical countries as to become annoying weeds, especially in rich moist soils. A larger fruited species, P. Guajava, the Lemon guava, is cultivated to some extent in Florida and southern California, and though it is too tender to bear much frost, and is at times cut to the ground, it springs up rapidly and frequently bears the following year on the new wood, like a peach tree. There is another species of excellent quality in the highlands of Brazil, known as P. Araca. The writer can testify to the superior flavor of this species in its native habitat, and is glad to find it offered by a few dealers in tropical fruit plants. The fruits are rather large, greenish yellow in color, with white flesh and comparatively few seeds. Several other new types, most of them being horticultural varieties, have been brought to notice by the explorers for the United States Department of Agriculture, but have not yet been disseminated. The best known guava in the North is the Cattley or Strawberry guava, P. Cattleianum, which has been extensively sold in two varieties, red and yellow fruited, as window plants by mail plant dealers during the last five years. The fruits are an inch or more in diameter, and nearly round in shape, deep red with pink pulp in the one case and larger yellow fruits with white pulp in the other. They form attractive pot plants, of easy culture, bearing abundantly after two or three years' growth from the cutting. Fig. 369, first page, represents a fruiting twig of the yellow Cattley variety about natural size ripened in the Rural glass-house. The plant is three years old, and is established in a seven-inch pot. It set 138 fruits in May, which were subsequently thinned to 60. These have ripened thoroughly, but the later ones grew larger than those first picked, showing that more severe thinning would have been better. The flavor is quite agreeable to most persons who have tasted them, and there is a noticeable strawberry-like fragrance which is transmitted to the jelly and preserved fruits. The former takes some time to harden when made in the ordinary way, and is almost transparent from the lack of coloring matter in the fruits. The mild acid is very refreshing, and the appearance quite attractive. After ripening the fruits these potted guava trees become quite dormant if kept cool, and may be stored in a light warm cellar like an oleander until Spring. When in bloom it is best to keep them outside so that the bees may get at the flowers. Both varieties are desirable, and make good companions, but if only one is grown we should prefer the yellow-fruited kind. It is probable that the guava may be much improved in the future, when its needs have been better studied. Though of limited importance now, it is conceivable that larger-fruited varieties may be produced in time, and the number of seeds much lessened. Now that we have included tropical islands in our territory popular interest in such products may be expected to increase.

W. V. F.

A Supposed Pecan and Walnut Hybrid.

Fig. 370, page 818, is a reproduction of a cut appearing in a late number of the Observer, Fayetteville, N. C., representing an immature nut from a young tree grown from a Japan walnut, supposed to be pollinated from a nearby pecan tree. The originator, J. H. Breece, of Fayetteville, furnished the following account of its origin to his home paper:

In the Spring of 1894, a Japan walnut, standing 20 steps north of two bearing pecans, was observed to produce one cluster of pistillate flowers after the usual blooming season was past, but while the pecan trees were still in bloom. One nut resulted from the walnut blossoms, which was supposed to have been pollenized by the flowers of the pecans. The tree growing from this nut is now not more than five feet high. In 1895 I removed all the staminate flowers from the walnut, and although there were a considerable number of pistillate flowers only one nut was produced. The tree from this nut is vigorous, and would have yielded a lot of fruit but for the removal of its staminate flowers for the purpose of re-crossing with the pecan. As a consequence one nut only was produced, and is here exhibited in contrast with the nuts of its parent tree. No other bearing walnut tree was within a quarter of a mile except a small English walnut opposite the dwelling house. The Japan walnut tree has had its staminate flower buds removed each season, and since 1895 has produced from 40 to 70 nuts each year. All the nuts have been planted, and the trees are mostly vigorous. It is intended to destroy the Japan walnut tree this time, and hereafter cross the hybrids with the pecan. Such work is interesting if it had no more substantial object. The result already attained of an increase of 200 per cent in size is the most remarkable that might have been anticipated. If these characteristics can be blended with the pecan's quality of fruit and toughness of wood, it will be desirable.

The large nut at the right is the supposed hybrid, the smaller one on the left being a normal nut from the seed parent—the Japan walnut.

Subsequent correspondence with Mr. Breece develops the information that the nut, on examination after thorough ripening, has an outer hull and shell like the native Black walnut, though it was attached to the branch like the Japan walnut instead of by a distinct stem, as in the Black walnut. As the nut was to be planted the flavor and form of the kernel was not ascertained. It thus seems probable that the hybrid in question is really a cross between our Black walnut, Juglans nigra, and a Japan species, J. Sieboldii, or cordiformis, though in this case Mr. Breece says the pollen must have come from a distance as great as one-fourth of a mile, as no trees of the native species are growing nearer. There is apparently no physiological reason why genera so closely allied as Juglans, the walnuts, and Hicoria, the hickories and pecans, should not hybridize, though the relationship is more remote than between the various species of either genus, but it is not at all certain the union has been accomplished in this case.

HOPE FARM NOTES

THE WEATHER.—After several weeks of bright, clear weather the Sunday before Thanksgiving opened with a cold, driving rain. When morning came the clouds were racing along the sky and the rain was pelting hard at the windows. Hugh went to church alone, and the Graft and I delivered the milk, but the rest of the Hope Farm folks kept close under cover. The cows wanted to go out for a while, and a few of the hens walked out into the rain, but it was a comfort to know that there was warm shelter and food for everybody at Hope Farm, from the Madame down to the cat. There was a great mountain of golden ears in the granary, the corn fodder was all in barn or barrack, the fruit and potatoes were snug. The turnips were all in the hoghouse, and only a narrow strip of cabbage remained out doors. The growing grain and grass were happy. I was afraid the rains would catch us, but we got in ahead. These things lightened the gloomy outlook—for, say what we will about country living, a sad November rain washes all the brightness out of the landscape. When the early twilight of such a day comes you would better pull down the curtains, light the lamps and chase old memories out into the rain. Better make the present as comfortable as possible, and live right in it. On such a night I am in favor of lighting every lamp we have in the house. That's what I call burning kerosene in a good cause! The more light you get on a dark subject the better for you.

UNNATURAL THINGS.—My observation is that lots of us go on for years without really becoming acquainted with our families or farms. We go at them from an unnatural point of view, and thus fail to understand them. This thing came home to me recently on reading a very good little book entitled "Deafness and Cheerfulness." The author is so deaf that he has to use a trumpet, and he describes the growth of his trouble. Among other things he noticed that "few speak to the deaf man in pleasant tones." His wife seemed to be sharply ordering him about, neighbors and friends all seemed to be snapping and snarling at him. It seemed as if human tones had lost all kindness and sympathy! So they had—for him, but only because those who spoke to him were obliged to talk in unnatural tones in order to make him hear! They were as kind as ever—there was even more sympathy than before, but what he heard was a voice all out of tune with their sentiments. When I spoke of this at home the Madame gave me a queer little look and said: "There, I am glad you know now that I am not scolding you—that I am trying to make you hear!" Now the fact is that I have been in something of the position of the author of that book. I must confess that I have given the Madame undue credit for ability to use her tongue to inoculate her thoughts! Her voice has sounded out of tune, but I didn't realize that I was the one off the key. I refer to this to show how the wisest and strongest of us may fail to grasp the true relations between ourselves and the things that touch us. Blessed is the farmer who can understand his own limitations and quit adding his own faults and failures to the sins of others.

HOLLOW HEART.—The following question from Massachusetts is frequently asked:

> My Green Mountain potatoes gave a good yield, but the large ones all have hollow hearts. Does anyone know what causes this trouble? Will it be safe to use the hollow tubers for seed?

I wish our potatoes were large enough to show hollow hearts this year! I have never known this trouble except in large thick tubers. The long, slender kinds seldom have it. It is worst in varieties that are soggy and wet, though we have found it in Rural Blush, which we regard as the finest of cooking potatoes. It is what the scientists call an "obscure disease," but probably a too rapid growth is the usual cause. You take a young man and push him along too fast—puff him up with a sense of his own importance, and put too many rich opportunities in his way, and actual trial will find him hollow as a gourd. Crowd a potato on rich ground into a great size, or let it dawdle along in dry weather and then give too much rain, or let it be grown on rich, wet soil, and it will be quite sure to shrink at the center and leave a hollow space. I do not believe that a hollow-hearted tuber should be rejected as seed. "Black heart" is worse in potatoes or men. There is no hollow in this, but a dark lump surrounded by lighter colored rings. I regard this as a true disease, and would not advise using such tubers for seed.

FARM NOTES.—We are ready to begin shredding the corn fodder and shall probably get at it about the first of December. We are feeding a little uncut fodder now, and it surely is a wasteful method. . . . We have so much cabbage for the pigs this year that it is hard to find room for them all. The sows themselves make good warm storage for such crops, and we shall feed cabbage heavily during December with enough corn to give warmth and substance. After that the turnips come in, and we have enough for all Winter. I would not like to winter brood sows without green food of some sort. . . . I recently referred to a pear tree that gave a second set of blooms. The flowers amounted to nothing, but small bunches of leaves on that tree kept green until Thanksgiving. They were the only green things to be seen, and held their color in spite of several hard freezes. . . . . We are mulching around all the little trees with a good coat of manure—spreading a circle about four feet in diameter. I think this will help the Fall-planted trees to establish themselves, and will not injure those set out in the Spring. . . . . We consider it good economy to use dried brewer's grains for feeding. Just now we have no grain on the farm for the stock besides dried grains and ear corn. I think it would pay better to mix the dry grains with bran before feeding. . . . . Last Winter we sold several hundred chestnut poles. The tops and bark are still in the woods, and I intend to have them cut into stove wood during the Winter. There are two ways of selling this wood—one is to ship to the brickyards on the Hudson River and the other to peddle it out as fuel in the smaller towns, either in four-foot sticks or cut ready for the stove.

TERRIBLE TAXES.—I am pretty well ashamed of myself for saying a word about taxes after receiving this letter from Indiana:

> Nearly every 40 acres has or had ponds on it. I am draining and clearing 40 acres now that has 14 small ponds on it. Our drainage laws are very favorable for getting rid of these, and but very few now contain water. There is now soon to be let a ditch costing $5,500 with a 24-inch tile for outlet that I am assessed on. Some of the land benefited by this ditch is taxed $14 per acre. Just south of us is another ditch with 27 miles of tile (not including all of the branches), a 20-inch and a 30-inch discharging into a mile of open ditch. Part of this land is assessed $10 per acre. The ditch to cost $17,000, and it is this way all through this section. There are seven force ditches in this township under way now. In addition to this tax, the township is building a $20,000 school house, the county paying for a court house, the State for a State house; with a two-per-cent tax in perspective for an electric road through the township. From some cause the people most benefited or living the nearest a railroad are the most anxious for an electric line. Why? R.
> Tippecanoe Co., Ind.

They should change the old campaign song of "Tippecanoe and Tyler too" to "Tippecanoe and tile us too," for it looks to me as though every farm pocketbook in the county would be drained before they get through. Will all this expense pay? I have two fields that need draining, but when it comes to a whole farm I should certainly take to the hills where Nature wrinkled up her face on purpose to let the tears run easily away. Why do the people nearest a railroad want an electric road? In this county they want it to break up a monopoly. The reason that with an electric running alongside a steam railroad there will be competition, which will cut down freight and passenger rates and give better service. H. W. C.

"SAGO BEANS."—Cow peas are all right, but what is the matter with "Sago beans"? They look much like cow peas, are earlier, and the seed can be gathered by pulling the vines and thrashing like beans. The yield is good and the seed being small not much is required. I planted about a spoonful of seed and of course my experience isn't great, but I believe they may be as useful as cow peas. Who has tried the Sago bean?
Michigan. J. H. V.

CHEAP FARM POWER.—About a year ago I bought a Foos sweep grist mill and power combined, and a No. 11 Wolverine cutter, with 16-foot carrier, and they gave perfect satisfaction. I can grind out a grist while I could go to the mill and back and save the toll. The cutter and carrier work nicely and will cut an ordinary two-horse load in 20 or 30 minutes with power to spare. I wish I had bought a larger cutter. I have no doubt there are lots of small farmers fixed as I am who want to do their work with their own help. I fill a 25-ton silo and take my time for it. I can put a few loads in every day and carry my other work along at the same time; that gives the silage time to settle, and I get in a lot more.
Moodus, Conn. G. B. H.

L. A. BANTA, Ligonier, Ind.

I will Cure You of
Rheumatism.
No Pay Until You Know It.
After 2,000 experiments, I have learned how to cure rheumatism. Not to turn bony joints into flesh again; that is impossible. But I can cure the disease always, at any stage, and forever.
I ask for no money. Simply write me a postal and I will send you an order on your nearest druggist for six bottles of Dr. Shoop's Rheumatic Cure, for every druggist keeps it. Use it for a month, and if it does what I claim pay your druggist $5.50 for it. If it doesn't I will pay him myself.
I have no samples. Any medicine that can affect rheumatism with but a few doses must be drugged to the verge of danger. I use no such drugs. It is folly to take them. You must get the disease out of the blood.
My remedy does that, even the most difficult, obstinate cases. No matter how impossible this seems to you, I know it and I take the risk. I have cured tens of thousands of cases in this way, and my records show that 39 out of 40 who get those six bottles pay, and pay gladly. I have learned that people in general are honest with a physician who cures them. That is all I ask. If I fail I don't expect a penny from you.
Simply write me a postal card or letter. Let me send you an order for the medicine. Take it for a month, for it won't harm you anyway. If it cures, pay $5.50. I leave that entirely to you. I will mail you a book that tells how I do it. Address Dr. Shoop, Box 570, Racine, Wis.
Mild cases, not chronic, are often cured by one or two bottles. At all druggists.

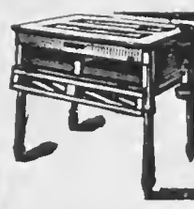
Bowker's Animal Meal
Makes Larger Eggs and More Eggs
Bowker's Animal Meal supplies the fowl with all the materials to make eggs with. It is not a stimulant, but a true animal food. It makes your hens lay, and your chicks grow strong and lusty. It is far the cheapest and best of all poultry foods. Give it a trial. Enough for ten hens, 3 months, $1.00; four times as much, $2.25 We send booklet, "The Egg," free.
THE BOWKER COMPANY, Dept. No. 7, 43 Chatham Street, Boston, Mass.

A Gain of 1,500 Eggs in 7 Weeks.
I find that Bowker's Animal Meal does the work. I have used it since 1896, when I never had hens lay so well as they did that Fall. In 1897, I experimented by not feeding it, and gathered about 1,350 eggs from August 14 to October 1. This year I used the Animal Meal again, and for the same seven weeks I gathered over 2,800 eggs, a gain of nearly 1,500.
Trenton, N. J. E. T. MCGALLIARD.



200-Egg Incubator for $12.80
Perfect in construction and action. Hatches every fertile egg. Write for catalogue to-day.
GEO. H. STAHL, Quincy, Ill.

GET FERTILE EGGS AND LOTS OF THEM by feeding cut raw bone It makes vigorous chicks, too. The easiest running most rapid cutting machine for preparing it, is the
MANN'S BONE CUTTER 1902 Model New design, open hopper, enlarged table, new device to control feed. You can set it to suit any strength. Never clogs. Sent on TEN DAYS' FREE TRIAL. No money asked for until you prove our guarantee on your own premises, that our new model will cut any kind of bone with adhering meat and gristle, faster and easier and in better shape than any other type of bone cutter. If you don't like it, send it back at our expense. Free Cat'g explains all.
F. W. MANN & CO. Box 15 Milford, Mass.

The Rural New-Yorker

THE BUSINESS FARMER'S PAPER.

A National Weekly Journal for Country and Suburban Homes.

Established 1850.

HERBERT W. COLLINGWOOD, Editor.
DR. WALTER VAN FLEET, H. E. VAN DEMAN, MRS. E. T. ROYLE, } Associates.
JOHN J. DILLON, Business Manager.

SUBSCRIPTION: ONE DOLLAR A YEAR.

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs.

"A SQUARE DEAL."

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

Name and address of sender, and what the remittance is for, should appear in every letter.
Remittances may be made in money order, express order, personal check or bank draft.

THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, DECEMBER 7, 1901.

THE New York Milk Exchange is making something of a record by advancing the price to the producer twice in one week. This brings the gross price delivered at terminals here to $1.71 per 40-quart can, which nets shippers in the 26-cent freight zone about 3½ cents per quart, except where extra charges are made at shipping stations. These advances are made on account of the shrinkage in receipts, amounting to nearly one-fifth. The high prices of feed of all kinds have made it impossible to produce milk at a profit, and many farmers have been selling cows or feeding less grain.

*

"THE well-known farmer" is at it again acting as a small-sized Judas to betray his neighbors. He drives around with the creamery shark or promoter, introduces his friends and tells great stories of what the new enterprise will do for the neighborhood. His name heads the list for a good-sized bunch of stock, but he pays nothing for it. That is the price he receives for selling out his neighbors. There are cases where such work is perfectly legitimate and helpful, but to give character in this way to a stranger who tries to promote a wildcat scheme is nothing but clear betrayal.

*

ON page 801 Mr. Hitchings tells how he starts and cares for his apple trees. We venture to say that very few fruit growers will have the courage to follow the practice he advocates. They will not have the nerve to cut that fine growth of grass and leave it to rot on the ground. They will want to cut it and use it for hay, thus upsetting the very foundation of Mr. Hitchings's system. Don't! DON'T! DON'T attempt any such scheme with this mulching left out. Far better set your trees in the good old way—which has given good results for years. Why then do we ever refer to these new or strange things? So that people may study them and see whether they fit the home farm. They are *never* designed or recommended for general application!

*

IT sometimes happens that a public man takes a position which is directly opposed to the best interests of the farmers of his State. Such cases are not by any means rare. The man may be a strong politician who has reasoned shrewdly that there are no forces among farm organizations strong enough to injure him politically. Thus he feels secure and ignores the protests of individual farmers. Who is to fight the battle of the farmer in such a case? Suppose he appeals to the director of his experiment station. The answer would probably be about like this: "This is outside of my business. The station is supported by public funds. If I attacked this man he could probably defeat the appropriation for the station or college. This would cripple our work, which really has nothing to do with politics!" Let us suppose the farmer recognizes the justice of this and turns to the large State society to which he belongs. Here he receives much the same answer. "We cannot afford to attack this man, because we must have our State appropriation! If we lose this appropriation we cannot hold our annual meeting." The farmer then turns to the Department of Agriculture of his State. He is told that it was organized to "disseminate wisdom," and that it is not a part of wisdom to gain the ill-will of a strong politician. The farmer finds plenty of people anxious to hand him out large doses of knowledge, but what he wants is somebody to kick for him. Who is to do it? We believe this is one legitimate mission of the independent agricultural paper. We do not mean petty nagging, or ill-tempered general fault finding, but strong, well-considered and fair criticism. The farmer can only expect this service from a paper which derives a good share of its income from its subscribers. The paper which cuts its price far down below the cost of production and then depends upon its advertisers almost entirely for support cannot afford to be truly independent where the interests of its subscribers are concerned. Where the paper's support comes from there will its heart be also. The paper that charges a fair price, and is so well supported by farmers that it does not need to crawl after political patronage or shaky advertising wears no padlock on its pen or tongue, and can afford to fight the public enemies of agriculture.

*

WE reprint the picture of our postage stamp man on page 818. This is the way he looked at the close of the last session of Congress. His constituents had been *voting with the postage stamp.* Every mark you see on him represents a good letter of protest against oleo or some other evil which threatened the farmer. This is the way the man looked last Spring, but during the Summer he has rubbed most of the stamps off. We must put them on again at once. A man weighing 200 pounds will require $64 in postage to send him through the mails. That will mean 3,200 two-cent stamps, and that number of strong, earnest letters will bag him. This is the rate for first-class matter. An oleo Congressman can hardly be said to come under this class, but let's pay full postage on him in order to make sure. Just now we advise sticking every stamp that can be used on the Hon. D. B. Henderson, Washington, D. C. Write to him at once and say that you oppose the reappointment of J. W. Wadsworth as chairman of the House Committee on Agriculture on account of his stand on the oleo bill. Come now—lick a stamp for bossy and the babies!

*

A SEIZURE of eight "burrs" or prickly devices attached to the bit of driving horses, intended to torture the unfortunate animal into champing his bit and tossing his head in a stylish manner, was made one afternoon from the carriages of society people attending the late very fashionable horse show in New York. These burrs are leather pads nearly three inches in diameter, studded on one side with stiff bristles, or even tacks and sharp nails, and are placed on the bits with the sharp points next the tender skin outside the lips. When the lines are pulled or the horse moves his head to one side the irritation causes him to jerk about in a way considered very "swell" by the cruel or unthinking owner. The seizure was made by agents of the Society for the Prevention of Cruelty to Animals, and in every case the horses belonged to wealthy patrons of the horse show. The use of these torturing burrs is said to be an offence under the penal code of New York, and it is hoped prosecutions will follow. Poetic justice might require the horse owners and their coachmen to lunch on a chestnut burr or paper of carpet tacks, but a few convictions, with fines or imprisonment and the accompanying publicity, will go far to stop the detestable practice.

*

THIS is a great big country. There was a time when the States were put together like the big stones in a farmer's stone wall. Within the last 25 years all this has changed. Trade and competition have bound the stones together as with cement, and no farmer can say any longer that he does not fear the competition of distant farms. Farmers east of the great lakes know that products from every State in the Union come into their markets to compete with those grown on their own farms. California fruit, southern vegetables, western hay, grain and meat are all crowded upon them. The wisest of these farmers are tracing back these distant-grown products to see how they are able to compete after a journey of hundreds or thousands of miles. In this way they have learned about the California box for apples, and California methods of packing. They are using this knowledge to better their own business. Others have traced back the cheap fruit or other products from the South, and thus learned the true value of cow peas, Crimson clover and other plants. This knowledge has enabled them to reduce the bills for manure or fertilizer, and restore waste lands at a reasonable expense. Who will say that this knowledge of what their distant competitors are doing has not been useful to them? Twenty years ago a farmer could afford to narrow his methods and experiments down to the practices of the best farmers in his own State or county. At that time competition was also limited and narrow. Now competition has widened and become more fierce, and the farmer must also widen in his study and observation. We have spoken thus far of what the East may learn of the South and West. There are those who say that the West has no need of eastern methods or farm experience. Here is a letter which seems to us a complete answer to that argument:

> This used to be considered the garden spot for corn raising, but like some other things, it is worse for the wear. On the average cornfield you do not see two or three joints above ground thickly studded with brace roots. The land needs a tonic to thicken up its blood of fertility. That is the reason I take THE R. N.-Y., for I know we are treading the same path our forefathers in the East have trodden. E. H. T.
> Bates, Ill.

It is well known that there are farms in New Jersey which have been under the plow for 150 years, producing now more corn per acre than 90 per cent of the corn farms in the Western States!

*

IT is easy to remember when the annual report of the Secretary or Commissioner of Agriculture was regarded by the daily papers as a joke, or dismissed with a few lines. City people were then disposed to laugh at the efforts of organized agriculture to gain dignity and business standing. We realize what a gain has been made in the minds of those same people when we see how Secretary Wilson's report for this year is received. The leading papers devote columns to a synopsis of it, and discuss its suggestions seriously. The National Agricultural Department, once laughed at, is now respected, and its value is admitted. The careful work of the present Secretary is responsible for this gain in dignity. The common farmer may say that all this means nothing to him. He is wrong, for as the general business of farming gains in character and the power to command respect, the poorest man on the farm will find it a worthier profession.

*

THE statement of that "seed case" printed on our first page will attract general attention. Readers must bear in mind that it is quite possible to clean the weed seeds out of grain. There are machines for doing this which will leave the grain perfectly clean. That being the case, no seedsman has any right to state that he has "exercised every care" when any number of such seeds are left in the grain, because it is possible to take them out. In most cases the trouble comes in selling seeds without inspection. The seedsman buys from the farmer, and with scarcely a glance at them turns them over to his customer under his so-called "guarantee." We have received nursery stock which came in the original packages through three different hands without inspection or any effort to show that the stock was clean and true to name. We are glad that the courts give the farmer a chance to hold the dealer on his warrant. The principle is a far-reaching one. If wild mustard seeded on the farm gives just cause for damages, the introduction of the San José scale, being even more dangerous, may render the nurseryman liable unless he use great care in his guarantee. Of course the trouble is that most farmers will not press cases of this sort through the courts, though we believe that there would be a wholesome effect if more of them would follow Mr. Bell's example. The Grange or some other farm organization might well establish a legal department, and put good lawyers on the trail of some of these careless dealers!

*

BREVITIES.

SURPLUS roosters are crow curs!

NO—don't get your mind set on infertile ideas.

A VIGOROUS constitution is required to stand a rigorous climate.

WHO blames turkey for taking French leave at Thanksgiving time?

WORKS without faith—the drudge; faith without working—the crank.

"THRASHING" stone is the latest name for fitting stone for road metal.

A WORD to the whys! Write your questions on one side of the paper.

YOU do not need to be a crank in order to do your friends a good turn.

HAVE you had any trouble with adulterated stock food? If so, let us know about it.

SOME folks would be better off if they stopped exercising care and exercised their muscles a little.

PAPER from cornstalks doesn't seem to be a very solid proposition yet. However, there are plenty of other uses for cornstalks.

SECRETARY WILSON suggests that it would be wise for this country to imitate England and prohibit the importation of live stock.

A BLACK heart is worse than a black skin. Would that we could make a majority of the men of this country believe that. Do they not believe it now? Do you think they act as though they did?

Events of the Week

DOMESTIC.—Seventeen cases of smallpox developed at New Hartford, Minn., recently, the result of exposure to the disease at a wedding. This disease is reappearing in many sections, and there is reason to fear a serious outbreak during the Winter. The number of vaccinations has fallen off in some of the large cities, owing to the fear excited by reported cases of lockjaw following it. . . . . Twenty-five lives were lost by a fire in the Bullion tunnel of the Smuggler Union Mining Company, at Telluride, Col., November 20. The buildings at the mouth of the tunnel were burned, filling the mine with smoke. . . . . Two limited passenger trains on the Santa Fe Line crashed together, 20 miles east of The Needles, Cal., November 20, killing seven trainmen and injuring 17 persons, three of them passengers. . . . . The Secretary of the Interior has been asked by the homesteaders in the Kiowa and Comanche country, in Oklahoma, to decide whether or not their homestead entries, which conflict with alleged mining districts therein, will be recognized. The decision will affect 1,000 homesteads in the vicinity of the Wichita Mountains. . . . . The cost of the trial of Assassin Czolgosz was $1,799.50. Of this sum $1,000 was paid to the insanity experts, who examined him, and $500 to the attorneys who defended him. . . . . November 23-24 a furious storm did much damage along the Atlantic coast. The New Jersey coast was strewn with wreckage, and much loss of life is feared. Great property loss occurred at Long Branch and vicinity; the big iron pier was totally destroyed, for the third time, carrying one man out to sea. . . . . The beet sugar manufacturers of Michigan, Ohio, Wisconsin and Minnesota met in Bay City, Mich., November 26, to formulate a plan of action with regard to the efforts being made to abolish the tariff on sugar imposed by the Dingley law. . . . . A boiler explosion in the Penberthy Injector Works, at Detroit, Mich., November 26, caused the death of 26 men, and serious injuries to 24 others. The building was totally wrecked, the crash coming without warning, and fire followed immediately. The property loss is $180,000; cause of the explosion unknown.

ADMINISTRATION.—It was stated in Washington November 20 that President Roosevelt, in his message to Congress, will not only recommend the reënactment of the Chinese Exclusion act, but will recommend that it be strengthened to increase its efficiency. . . . . The Secretary of War has directed that the order granting free admission of Christmas presents to the Philippines and Cuba shall extend only to the officers and men and civilian employees of the army and navy, but not to the civilian employees of the civil governments. . . . . A delegation of Cubans called upon the President November 25 and presented a petition adopted by the industrial organizations of the Island, urging upon his attention the necessity of reduction in the American tariff upon Cuban products, particularly upon sugar and tobacco.

PHILIPPINES.—The force of marines, under Major Waller and Captains Porter and Bearss, attacked an almost impregnable position at Sojoton, Samar, November 17, destroying three camps, killing 30 men, capturing 40 bamboo guns, rice and stores. The men had to scale a cliff 200 feet high. . . . . Aguinaldo has written General Chaffee, asking permission to go to Washington with eight Filipino friends, whom he designates, to lay before Congress the desires of his people. . . . . An epidemic of smallpox is reported to be hampering military operations in the Island of Leyte. The Philippine Commission has decided to prepare a law ordering compulsory vaccination throughout the Archipelago.

GENERAL FOREIGN NEWS.—The State Department has received official confirmation of the capture of Colon by the Liberals. Transit was interrupted for a brief period, but is now restored. Captain Perry, of the Iowa, at Panama, has been instructed to land marines if necessary to maintain transit across the isthmus. A despatch received at the Navy Department from Commander McCrea says that 100 blue jackets were landed from the gunboat Machias at Colon, and took charge of the railway station. . . . . The Bulgarian Foreign Office resents the insinuations that the Government is acting in bad faith in the matter of effecting the release of Miss Stone, and explaining its attitude toward Mr. Dickinson, the diplomatic agent of the United States, affirms its entire readiness to take any action suggested by him. Mr. Dickinson has sent an ultimatum to the brigands, who are still claiming a high ransom, and say they can hold the prisoners as long as they please. . . . . John Goodnow, Consul-General at Shanghai, reports to the State Department that there are over 500,000 people in the Yangtse Valley who will starve this Winter unless they get help from outside. A committee of foreigners and Chinese has been formed to relieve the conditions of these people, and all foreigners are subscribing liberally.

FARM AND GARDEN.—The annual meeting of the American Shetland Pony Club was held at Chicago, Ill., December 3.

The National Grange has reëlected Aaron Jones, of Indiana, as Worthy Master.

The Ontario Fruit Growers' Association met at Cobourg, Ont., December 4-6.

In his annual report, which will be completed soon, Postmaster-General Smith will ask for an increase of the appropriation for the rural free delivery service from the present sum of $3,500,000 to $6,000,000, and will advocate the extension of the service as far as practicable. He will express the opinion that this branch of the work of the department is of the greatest utility, and will plead for most liberal consideration on the part of Congress.

The Michigan State Horticultural Society met at Fennville December 3-5.

The Minnesota State Grange will hold its annual meeting at Minneapolis December 17.

The Nebraska State Horticultural Society will meet at Lincoln January 7, 1902; secretary, C. H. Barnard, Table Rock, Neb.

The Minnesota State Dairymen's Association will meet at Sauk Centre December 10-12; secretary, Robert Crickmore, Pratt, Minn.

The Massachusetts State Grange will meet at Springfield December 10-12; secretary, C. A. Dennen, Pepperell, Mass.

The Vermont State Grange will meet at White River Junction December 11-12.

The New Hampshire State Dairymen's Association met at Claremont, N. H., December 5-6.

The New Hampshire State Grange will meet at Concord December 17-19.

The Kansas State Horticultural Society will meet at Topeka December 26-28; secretary, William H. Barnes, State Home, Kan.

The Kansas State Grange will meet at Topeka December 10; secretary, Geo. Black, Olathe, Kan.

The Winter wheat yield in Kansas this year was 90,045,514 bushels, valued at $50,479,570. This breaks last year's State record by 13,450,070 bushels. The area now sown in Winter wheat is nearly 6,000,000 acres, which, with favorable weather, will yield more than 100,000,000 bushels. The corn crop in Kansas this year was only 42,605,672 bushels, but the value of the combined wheat and corn crops was but 11.3 per cent less than that of the same crops in 1900.

The National Association of Nursery Inspectors met in Washington recently, President Forbes, of Illinois, presiding. Among those present were Prof. J. B. Smith, New Jersey; Prof. W. B. Alwood, Virginia; Prof. Atwood, New York; Prof. Forbes, Illinois; Prof. Throop, Indiana; Prof. Scott, Georgia; Prof. Green, Ohio; Prof. Webb, Delaware; Prof. Summers, Iowa; Prof. Fernald, Massachusetts.

The annual meeting of the Pennsylvania Dairy Union at York December 4-5, included many excellent speakers. Among the subjects treated were: "Commercial Food Stuffs," Dr. W. H. Jordan, director of the New York Experiment Station. "Protein—Can it be Produced on the Farm Profitably?" Professor H. J. Patterson, director of the Maryland Experiment Station. "Why do the Milk and Cream Tests Vary So?" Professor J. L. Hills, director of the Vermont Experiment Station. "The Essentials of Success in Breeding Live Stock," Mr. E. A. Sibley, of Prospect Hill stock farm. "The Importance of Hygiene in the Dairy," Dr. M. E. Conard, of the University of Pennsylvania Veterinary College. "The Future of Condensed Milk," Mr. C. L. Peck, Coudersport, Pa. "The Oleo Laws of Pennsylvania," Secretary John Hamilton. "Soiling Dairy Cattle," illustrated by stereopticon views, Dr. Voorhees, director of the New Jersey Experiment Station. "Home Buttermaking," Mr. L. W. Lighty. "The Influence of the Cream Separator Upon the Dairy Industry," P. M. Sharples, West Chester, Pa. Mr. R. A. Pearson, Assistant Chief of the Dairy Division of the Bureau of Animal Industry of the United States Department of Agriculture, delivered an illustrated address on "Dairying in Porto Rico and Cuba."

The twenty-third annual meeting of the Ontario Agricultural and Experimental Union will be held at Guelph, Canada, December 9-10. The Ontario Provincial Winter Fair will be held at Guelph December 10-13.

A. Q. Spaugh, a Wyoming cattleman, has been ordered to remove the fencing he has erected around 225,000 acres of Government land. There are more than 100 miles of fencing, and Spaugh declares it will take a force of 30 men a month to remove it.

THE COST OF AN ACRE OF CORN.

Estimates by Western Farmers.

The following is a very fair estimate of the cost per acre: Plowing, $1; harrowing three times, 30 cents; seeding, 30 cents; cultivating three times, 96 cents; total, $2.56. This does not include seed grain. F. M. G.

Hawarden, Iowa.

At present prices for labor plowing costs about $1 per acre; harrowing three times, 30 cents; planting, 25 cents; cultivating three times about $1.25; husking, $1, making a total cost of $3.80 per acre. The harrowing is done once before and twice after planting. J. S.

Corning, Iowa.

In this locality to raise 50 acres of corn would cost about as follows: Plowing, $50; dragging three times, once before and twice after planting, $12; planting, $15; seed, $6; cultivating four times, man and team, 25 days at $2.50 per day, $62.50; husking and cribbing 2,500 bushels, at 3½ cents per bushel, $87.50; rent for land, $175; total cost, $408, or $8.16 per acre, and about 16 3-10 cents per bushel. The price I have charged for labor is the going wages around here. Fifty acres are about the amount I raise each year. Corn, oats and barley are our main grain crops.

Benson, Iowa. H. R. B.

The cost per acre on my farm for growing corn is about as follows: Plowing, per acre, $1; harrowing, 20 cents; seed, 15 cents; planting, 20 cents; harrowing, 20 cents; cultivating, $1.40; rent of land, $5; total, $8.15. It must be remembered that the plowing and harrowing are mostly done with four-horse teams, a two-row planter is used, and a whole-row cultivator, which economizes labor. The estimate is made on the basis of $1 per day per man, and 50 cents for each horse. The item of rent must advance, for the average price of land has passed the hundred-dollar mark. E. E. C.

Champaign, Ill.

We have two methods of raising corn here; one is surface planting and the other is listing. We consider 50 bushels to the acre is an average crop on good ground during a medium season. The past has been a very bad season, and we will not have over 40 per cent of a crop. I will give you cost of surface planting first: Plowing the ground, $1 per acre (50 acres, $50); harrowing ground twice, four days, $12; planting, $12; seed, $6; cultivating three times, $50; gathering corn, 50 bushels to acre, 50 acres, three cents a bushel, $75; harrowing corn when it first comes up, before the first cultivation, two days, $6; total, $211. The cost will be about eight cents per bushel. Land rents for about $5 per acre best land. That would bring the cost up to 18 cents per bushel if you rented the land. Cost of listing corn is as follows: Listing and planting, done at same time, six days, $18; seed, $6; one harrowing, two days, $6; three cultivatings, 17 days, $50; husking 2,500 bushels, three cents per bushel, $75; total, $155. I think one man in a good season could tend 70 acres by listing as easily as he could 50 by surface planting with the same cost, except that the gathering would amount to more; 70 acres, 50 bushels per acre, would be 3,500 bushels, at a cost of about $225, which would be about 6½ cents per bushel; rent, 10 cents per bushel, making 16½ cents by listing. G. W. D.

Waverly, Ill.

We estimate the following to be about the average cost of the various operations necessary to brug a crop of corn to maturity, on a scale of 40 or more acres: Cost per acre for plowing, 80 cents; harrowing, 18 cents; seeding, including cost of choice seed, one bushel to eight acres, 30 cents; four (usual number) cultivations, $2; total cost per acre for plowing, harrowing, seeding and cultivating, $3.28. This estimate is given presupposing the use of four-horse (most practical) implements for plowing and harrowing and two-horse implements for seeding and cultivation; also the absence of any trash that might have to be removed, and it does not include the wear of machinery—it includes only labor and care of horses. All things considered, we would place the average practical cost of producing one acre of corn on a 40 or more acre scale at $5. This includes the little jobs, such as replanting, weed pulling, etc., which are always more or less abundant, wear on machinery, and cost of husking; but allows that the horses used will pay their own way when not needed on this crop. R. O.

Bluffs, Ill.

A great deal depends upon condition of soil at time of planting, as some seasons it requires more labor properly to prepare it for planting corn than in other seasons. It also depends upon the wages paid in the vicinity. I believe it pays to put the soil in the best possible condition before planting. If the soil breaks up a little lumpy or dry I use a roller after the plow, and then harrow thoroughly before planting. I never roll the ground if it is the least bit wet, but wait until it begins to whiten, then start the roller. Two harrowings will not put the ground in as good condition as the roller, unless the soil breaks up very fine; then the roller is not necessary. We generally cultivate our corn five times, and more if necessary. We never allow a crust to form after a heavy rain if we can help it. Basing the price of man and team at $3 per day, not counting board, harrowing the ground after the plow, and following with the planter, as is the custom, I believe where a large acreage is planted the cost would be about as follows: Plowing, $1.75; harrowing, 30 cents; planting, 40 cents; cultivating three times, 90 cents; total, $3.35. S. M. R.

Belleville, Ill.

Apples in Southern Illinois.

Apples sold last year at 20 to 25 cents per bushel, track, at small stations. This year they are selling at from $2 up to $3.50 per barrel; varieties, Ben Davis, Minkler, Jonathan, Grimes, etc.; crop small. T. K. D.

Vernon, Ill.

The principal variety here is Ben Davis; some Limbertwig, Rome Beauty and Winesap, but mostly Ben Davis. As to crop I am not able to say, perhaps one-sixth of a crop. A great many are faulty and dropped from trees on account of extreme heat. One orchard of 40 acres sold in this vicinity for $2,000; others in the county much higher, and from 40 cents to 90 cents per bushel, delivered at shipping point. O. P.

Palmersburg, Ill.

Selling Apples in Boxes.

The Niagara Falls Journal in its report of a meeting of the Niagara Farmers' Club says:

"W. H. Outwater, manager of the Outing Park at Olcott, gave a practical and valuable demonstration of shipping Niagara County apples in boxes. He exhibited a half-bushel box packed with the favorite fruit of this county, and it made a very attractive display. In 1896, the year of the great crop, Mr. Outwater shipped a carload of apples in boxes from his orchard to California. They were consigned to a commission house at Los Angeles, Cal., and found a ready sale. After paying all expenses the apples netted him at the rate of $1.36 a barrel, while apples were ordinarily selling at from 60 to 90 cents, including the barrel, that year. During the same season he shipped a carload of apples to Atlanta, Ga. Some were packed in barrels and others in boxes. The commission men were loath to receive the boxes, but they were urged to do so, as an experiment at least. When these boxes were placed on sale in the grocery stores in the southern city, with the covers removed, showing the bright red and green fruit in layers, they immediately attracted attention, and there was a big demand for more apples in boxes. Mr. Outwater explained the many advantages of placing apples on the market in this manner; how they would find a more ready sale in cities, where many families have not the means to buy a barrel of fruit at a time, nor a place to store such a quantity. But the box, he said, was always attractive and convenient. The cost of boxes is no more than that of barrels, for the same quantity of fruit and more can be shipped in a car loaded with boxes than with barrels."

ILLINOIS CORN.—We are not in the great corn belt of Illinois. It is from 50 to 75 miles north of us. While there are some large farms here, they are mostly worked by tenants. Most of our corn is raised on river and creek bottoms. Prairies are devoted to hay and small grain mostly. We raise something of all kinds of grain and grass; also stock peas, which usually do well, and we find they improve our land. Some are cut for hay, some pastured and some plowed under. This is the poorest crop since 1881. The Spring was very dry, so that oats and hay did not get a good start; then we had several heavy rains in June and July. We have not had a rain that wetted cultivated ground two inches since July 5. We could have stood the drought, but the hot winds from the southwest struck us when our corn was in tassel, blasting that, and in many cases the stalk down to the ear. Then early in September we had a killing frost, so you can see we are not shouting over our prospects—at least not very loud. Corn is worth anywhere from 50 to 75 cents per bushel, and not very good quality. Oats 35 cents, wheat 75 cents, hay $11 per ton on track. Hogs, which are our main money crop, five cents per pound. We never have two failures in succession, so we will pull through the Winter as best we can, and hustle in the Spring for all we are worth. R. W.

Mason, Ill.

Apples, cabbages, beans and wheat are staple crops in Orleans Co., New York, and some immense cabbage crops are being harvested. One farmer I talked with had 20 men at work, and was putting in the storage house 60 tons of cabbage per day. He said that it would take at least seven days to clear up his crop of over 400 tons. P.

Woman and Home

From Day to Day.

If living is a joy to you,
Because your soul is sound,
And life seems good and sweet and true
That you have haply found,
Then sing no false and hopeless strain
Of doubting and despair,
But lift your voice all clear and plain
And sing that life is fair!

Sing of its beauty and its worth,
Its bright and sunny skies,
Sing all the loveliness of earth
As seen by happy eyes;
For then the souls despondent born
Shall find them brave and strong,
Their way less gloomy and forlorn,
Because of your glad song!

—St. Louis Republic.

*

This Winter heavy dogskin gloves of reddish tan are likely to be greater favorites for women's general wear than the gray castor or mocha which have been so popular. The dogskin gloves are made exactly like those worn by men, with spearhead stitching on the back, lapped seams, and large gores let in at the thumbs which form part of the body of the glove. They fasten with one clasp, and cost $1 a pair. They wear excellently, and are warmer than kid.

*

Feather dusters are not ordinarily regarded as ornaments, but those made of peacock feathers are almost gorgeous enough for the Queen of Sheba. They are very oriental looking, the feathers being fastened to the handle with gold and silver threads, and the gorgeous eyes of the feathers fully displayed. They cost 75 cents each, and are often hung by the side of an open grate, to remove any dust flying over mantel and bric-a-brac, after stirring the fire. For such use the feather duster has its place; as often used, however, it is a hindrance rather than a help, since it only sends dust flying from one place to settle in another.

*

A kitchen convenience noted recently was a spoon holder for the large iron spoons used in cooking. It held them suspended from hooks over a tray, so, while in use, each spoon could be hung up separately, without dripping upon the table. Asbestos mats to stand upon the stove are indispensable (especially when a gas stove is used), and we now see asbestos table mats, to prevent hot dishes from marring a polished table when no tablecloth is used at luncheon. The asbestos has a linen cover made to fit; two pieces of linen of the right size are stitched together around the edges, the lower piece being cut through the middle crossways to permit the asbestos to be inserted.

*

A Quakeress of Revolutionary times, Ann Whitall, kept a little diary or book of "meddatations," as she quaintly phrased it. She was a very earnest and devout woman, full of good works, but like many of later date she regarded consistent melancholy as her ideal of conduct. She writes in her diary: "I often thinks if I could be so fixt as never to laugh nor to smil I shud be won step better; it fils me with sorrow when I see people so ful of laf and of prate." In Mrs. Whitall's opinion, godliness and gloom should go together hand in hand. She is not alone in this idea; many good people still believe that gaiety of heart and personal piety are mutually opposed. It is surely a mistake to confound cheerfulness with levity, and to regard melancholy as a state of grace. The serious long-dead Quakeress laments in her diary the vanity of some girls in Pennsylvania, who "has got thare necks set off with a black ribbon —a sorrowful site indeed," but it is pleasant to believe that she fell from grace so far as to smile occasionally, in spite of her effort to cover her busy, useful life with gloom.

*

A belt and stock to match gives a finish to a very simple gown. A soft stock recently seen was of white satin edged at top and bottom with round black braid, while the satin was decorated with French knots worked in pale pink and pale green silk. The stock formed a simple band, with a pointed end, fastening a little to one side of the front. The belt had pointed ends, which crossed in the front, and widened out at the back. Like the stock, it was edged with black braid and embroidered with knots. Where a stock is tied, a decided preference is shown for the four-in-hand knot rather than the bow. A great many women still wear their ribbon stocks tied in a bow in the back; always rather an untidy fashion, and often a very unbecoming one. Every time a coat is put on or off, the bow at the back is either cowering down as flat as though pasted on, or else it rears up defiantly, and refuses any attempts to coax it into place. Knots of white illusion or tulle at the back of the stock are still worn—by women who don't know any better; they are even seen on some of the made stocks, and very "mussy" they look, in most cases. The wearers forget that this soft, cloud-like knot is totally wrecked by the touch of an out-door wrap, and that it is entirely unfitted for general wear. Nothing makes a woman look shabbier than perishable finery that has lost its freshness. One can respect a well-brushed threadbare gown of plain material, but not a dirty and crumpled chiffon frill, or a pretentious trimming of ragged lace.

The Rural Patterns.

The Norfolk waist illustrated is now a favorite mode, and can be made with or without the pointed yoke, as preferred. The material of which the original is made is reseda green flannel with embroidered dots of black; but

3957 Norfolk Shirt Waist,
32 to 40 bust

flannel of all sorts, corduroy, velveteen and all waisting materials are appropriate. The foundation lining is fitted snugly and smoothly and extends to the waist line only. The waist proper is laid in wide box pleats that are stitched at their underfolds and again at each edge. The yoke is stitched firmly to position under the center front pleat and over the other box pleats, but both front and back pleats extend to the shoulders when yoke is omitted. The sleeves are in modified bishop style with cuffs that include pointed portions which match the stock collar. To make this waist for a woman of medium size 3⅝ yards of material 21 inches wide, 3⅛ yards 27 inches wide or 2⅛ yards 44 inches wide will be required, when yoke is used, 3¾ yards 21 inches wide, 3½ yards 27 inches wide or two yards 44 inches wide when yoke is omitted. The pattern No. 3957 is cut in sizes for a 32, 34, 36, 38 and 40-inch bust measure; price 10 cents.

Yoke waists are returning to favor, and the model shown is quite characteristic. The deep point of the front portion of the yoke is becoming, and the groups of tucks below provide graceful fullness at the lower portion of the waist. The back is smooth, with a desirable tapering effect produced by the

3970 Yoke Shirt Waist,
32 fo 40 Bust.

line of the tucks. As shown the material is doeskin flannel in submarine green, with gold buttons; but all flannels and waist cloths, plain, striped and figured taffeta and other simple silks, velveteen and corduroy are appropriate. The fitted lining is smooth and extends to the waist line only. The fronts of the waist are tucked in groups, of three each, that are stitched a short distance below the yoke, and include the full length center box pleats. The back is tucked in groups to the waist line. The sleeves are in bishop style, with narrow pointed cuffs; and at the neck is a collar with turn-over portions under which a ribbon stock is worn. To cut this waist for a woman of medium size 3¾ yards of material 20 inches wide, three yards 27 inches wide, 2¾ yards 32 inches wide, or 1¾ yard 44 inches wide will be required. The pattern No. 3970 is cut in sizes for a 32, 34, 36, 38 and 40-inch bust measure; price 10 cents from this office.

Free Rural Mail Delivery
HAS COME TO STAY.

Why not buy a Mail Box which will stay with it.

Uncle Sam's Favorite Mail Box

is approved by the U. S. Government. It is made entirely of steel. Nothing to draw damp, spring, warp or rot, and is too thick and heavy to rust out. Signal shows when mail is to be collected by carrier. Has spring letter holder and change holder to pay postage when you are out of stamps. Cover fits down on box like a hood. Rain or snow cannot blow in. Strong spring keeps lid always closed. Your name put on box in durable black letters. Box finished in white aluminum; looks like silver. These boxes are in use all over the United States. If on a free delivery route, or if one is to be opened by your place, you can save money by clubbing in with your neighbors. We send a sample box complete, with your name on it, for $2.00, express prepaid. Less in quantities. Send for illustrated and descriptive booklet, "The Story of a Free Rural Delivery Mail Box and Post." We mail it free.

Farmers—Listen!

Improved machinery has saved you many days of hard labor the past 10 years, and our Improved SPRUNG WASHER will do the same for your wives for the next 10.

Patented and perfected upon scientific principles with all necessary advantages connected with it. The Sprung Washer stands to-day unequaled. Our illustrated catalogue and booklet mailed free upon application. Address

THE AMERICAN MFG. CO.,
Department D,
Arlington Heights, Ohio.

A Wooden Washer works hard, rubs and destroys clothing, leaks and falls apart, is heavy and awkward to handle.

A Steel Washer—galvanized—never rusts, never leaks, never falls apart, is cleanly and will last a lifetime. That is why the

Syracuse Easy Washer

is made of steel. It is **easy to operate**, because it washes by air pressure. Air forces soap and water through the clothes and takes out the dirt. No rubbing on washboards, no wood or metal pegs to destroy clothes, as in other machines, but simply air pressure, without hard work, without friction, wear or waste, making washing easy.

It washes fast, washes clean, washes everything. It is on rollers to move about easily.

Thousands in use, each one a testimonial.

You take no risk on the EASY washer. **Try it four weeks,** then **return it if you wish.** Write for full information.

DODGE & ZUILL, 539 S. Clinton St., Syracuse, N. Y.

A Trek to the South.

PART III.

Lumbering was the business of the country through which we had passed for many miles—lots of sawmills; and at Conklingsville many factories for making things of wood. Then came a stretch of poor roads and farms, till we reached Broadalbin, when the country from there on grew lovely; such fine farms. At Johnstown we saw the Belgian hares; at one place a lot of them; and here the farms went into market gardening. It was a beautiful sight to us, as we had never before seen anything of the kind on so large a scale. All small fruits and vegetables. Our enjoyment of the city, however, was spoiled by the trolleys and McKinley getting into a fight with another dog right under the horses' feet, and we ran over them. McKinley got hurt and had to ride, and he first stood a "spell" on Fred's toes, and then a "spell" on mine. At Johnstown they buy large quantities of ginseng and pay high prices, and lots of people make a living gathering it. They saw our large carriage and a man asked Fred if we were ginsengers. We had passed lots of it, and Fred said that it would dry nicely on top of our carriage, and coming down hill he could tie strings of it to the carriage buttons. It sold at Cooperstown for $5 a pound, and if we could have taken care of what we passed that week it would have brought over $50. From there on to Fonda it was just one big hop field—miles of hops, with houses for curing the flowers and houses for the hands scattered through it; and we passed the hop-twine factory. Our road was a pike, beautifully smooth, and we made good time on it, and found a nice, quiet hotel to put up at. Fonda is a great railroad center, and the next morning as we drove along by the Mohawk River, it was a sight to look across and see the wires and the trains. At Palatine we crossed the bridge to Canajoharie. That town was a wonder to me! All factories and breweries.

In the afternoon we reached Cherry Valley (among the Dutch now). We passed many nice places, but they were all fenced in. We drove miles looking for a camping spot. At last I said to Fred:

"Some folks own the earth and put a strong wire fence around it."

He laughed and said it looked that way. But very soon then we came to a nice place, the horses had a good stable, and the children from the house brought us a bowl of delicious strawberries, and were much interested in the oil stove and our preparations for supper. All the way on to Cooperstown it is really a beautiful country, and the farms are fine; Jersey and Holstein cattle, and the products, dairy, hops and hay. At Cooperstown we left the level land behind us, it was now all hills. To reach the city we had to go up a long one. Fred did not like it, and asked a woman if there was not an easier road. She said there was not, and then added: "Well, if you go up, why you have to come down, you know." We found the truth of what she said. I took Mary's advice: "When you reach a bad hill, get Fred out, and get out yourself; and if things go to pieces, why—let them!"

We reached Milford that night, and all the next day we still traveled through a dairy country; such large stock farms! As we drove along by the Susquehanna River, we saw some beautiful pink locusts, and both of us spoke of the "Hawk." Fred borrowed a spade and dug up a little tree, and when we reached Oneonta he mailed it to her. (It has grown over a foot this Summer.) Oneonta is a large, lovely town, and we went down the hills on one side to get to it and up hills on the other side to get away from it. We had driven on a hill, under a tree, and then we climbed and went down hill and over a toll road—the fourth one we have gone on. Fred was mad, and thought it hard in a free country to tax people so. At five o'clock, when we reached Franklin, they said we were but seven miles from our dear Northfield friend; but somehow we took a wrong turn, and after driving through a wild country till about 11 o'clock, and rousing up two families to inquire the way, we put up for the night; and at four the next morning off we started. It was a lovely ride, and we reached Shady Lawn just as Will was milking. I asked him if he would take in some tramps, and he laughed and said yes, and brought me right to the house. Aunt Emmie was getting breakfast, and I went upstairs and had a wash and brush, and when I came back and sat down to that breakfast table and looked in the faces of my friends I tell you it felt good. We have traveled 272 miles between June 6 and June 21 with our team.

Northfield is a suburb of Walton, and is largely owned by good old New England stock, whose ancestors emigrated there when Delaware County was a wilderness, and cleared the land and built their homes. Walton is one of the banner temperance towns in the State, and the way the men turned out two years ago in a blizzard to fight for "no license," struggling through drifts and stinging cold, and almost impassable roads, shows what stuff they are made of; and it is not surprising that they have outstripped threefold in population the old, nearby license Oxford, with its two railroads and other superior advantages. As Will says:

"Drink seems to have a paralyzing effect on most villages, especially where given an air of respectability by hotel use. Liquor selling does pay best (i. e., brings more money) to those who sell it, but not to the hundreds who drink it. When it comes down to selfishness, pure and simple, these dealers take the cake every time!"

Shady Lawn is a dear old home, and a fair type of the best grade farms here. There are such a lot of springs on the farm. One runs right into the kitchen. I felt all the time as if it was a waste of water and must turn it off, but my, how Mother would enjoy it! The barns are so nice and well built and convenient, and a spring there, too—a fine place for the milk.

We have had a truly good time, and I would not have missed the trip for anything. We are getting our things fixed now so it will not be half the trouble to keep house; have lots of provisions for ourselves and horses, and all of us have had a nice rest. It has seemed good to be in a house once more and get cleaned and mended up. I cannot tell you what it has been to me to get among Christians again, and have prayers and grace, and to sit at a nice clean home table. Will is going along with us for a half day. I am to ride with him and have a last chat and visit. F. E. W.

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

Rural Recipes.

Fruit Tapioca.—Add two cupfuls of water to half a cupful of tapioca, and let it come slowly to boiling point; cook gently until the tapioca is clear and soft. Stir in half a cupful of sugar and when dissolved a glass of currant, or a tart red jelly, and stir and cook until you have a clear jelly. Remove from the fire and pour into a mold wet with cold water to prevent sticking. Set where it will get thoroughly chilled. Any kind of ripe fruit may be used instead of the jelly.

Scrapple.—The liver of a hog, cut in small pieces, the meat from the head and the scraps that will not grind up in sausage. Cook till all the bones will drop out readily, then remove to the chopping bowl and cut very fine. Season with salt and pepper to taste and add a tablespoonful of sweet marjoram and half a tablespoonful of sage. Return to the stove, having strained the liquor in which the meat was boiled. The liquor should be sufficient to more than cover it. Take equal parts of cornmeal and buckwheat flour and stir in until it is a thick mush. Let it cook thoroughly, then put into shallow pans or dishes, and run lard over it, just as you do over sausage, to keep until used.

Scalloped Apples.—Three cupfuls of bread crumbs, one quart of chopped apples, one-fourth cup of butter, one-fourth cup of sugar, one-quarter teaspoonful of grated nutmeg, one-half lemon (grated rind and juice). Do not use hard, dry crumbs; a stale loaf from which the crusts have been cut is better. Melt the butter and add to it the crumbs, stirring lightly with a fork. Butter a pudding dish, covering the bottom with some of the crumbs, and add half the apple. Make a mixture of sugar, spice and lemon juice and rind, divide into two quantities, and add one to the top of the apples, then repeat with crumbs, apples and spice, finishing with the remaining crumbs. It is well to reserve one cupful of the crumbs for the top. Bake for 40 minutes in a good oven, covering the dish the first 20 minutes to prevent the crumbs from browning too fast. Serve with foamy sauce.

Cranberry Roly-Poly.—Sift two cupfuls of flour, a rounded teaspoonful of baking powder and a half-teaspoonful of salt. Cut into this one tablespoonful of butter and one of lard. Mix into a biscuit dough with three-fourths of a cupful of milk. Roll out half an inch thick and spread with a layer of two cupfuls of chopped cranberries, cover with half a cupful of granulated sugar, add a tiny rose geranium leaf, roll up, pinch the ends together, lay on a buttered plate and steam for 40 minutes, then place in the oven for 10 minutes to dry off. Serve with maple sugar sauce. Pour a cupful of boiling water over a half-cupful of maple sugar cut into shavings. Cook until the sugar is dissolved. Add one tablespoonful of cornstarch rubbed smooth with a tablespoonful of butter and boil eight minutes longer, stirring constantly. Serve very hot.

BLOOD HISTORY

Born in bone marrow—dies in the liver. This is the beginning and the end of the rich, red blood that keeps us all alive. Blood history makes a fascinating story.

Scott's Emulsion often plays a most important part in blood history. At the very beginning—that is where its influence is greatest.

Scott's Emulsion is a blood food—a rich material for making new blood. Nothing better for bringing color to pale faces.

We'll send you a little to try, if you like.

BUSINESS BITS.

WHY not make your wife a Christmas present of one of those washing machines offered in this issue? If the men folks did the washing they would have a machine before the second week. Look up the advertisements and write for information about these labor-saving machines.

E. KRAUSER & BRO., Milton, Pa., have succeeded in liquefying hickory wood smoke, so that meat can be cured at home in a few hours. Smoke from hickory has a peculiar property that cannot be obtained from any chemical process or from burning any other substance. It not only perfectly cures meat, but gives it a sweetness and flavor that is peculiarly its own and perfectly wholesome. Put it on with a brush—a minute or two to a piece of meat; no more trouble than painting a board and no opportunity for insects to contaminate the meat. Full information will be sent free on application to E. Krauser & Bro., Milton, Pa.

OWING to the comparatively recent death of Geo. D. Harder and the still more recent death of his father, Minard Harder, the Empire Agricultural Works of Cobleskill, N. Y., will hereafter be conducted under the name of the Harder Mfg. Co. The business has passed into the hands of Edgar S. Ryder, and his son, Frank H. Ryder, who have superintended and managed it successfully for the past year. The foreman and trained force of employees have also been retained, and there is every assurance that under its present ownership and management this company will retain the enviable reputation that it has established and maintained during a period of 30 years.

PEOPLE who write letters should keep copies of them. Business men do this by means of a letter press or the use of carbon paper on the typewriter. Those who have neither of these conveniences have heretofore found it necessary to write out by hand copies of such letters as it was thought necessary to keep. The Pen Carbon Letter Book advertised in our columns is an excellent device for such people. Every letter written with pen or pencil is copied perfectly in this book while writing it. Without extra trouble a copy is kept of everything written, which is often invaluable for reference. No man or woman who writes letters can afford to be without one. Write Pen-Carbon Manifold Co., 145 Centre St., New York.

CUTTING CORN FODDER.—Farmers are unusually late with their husking on account of scarcity of help. I am through and stalks cut and blown up in barn. I think it pays in convenience and quality of manure even though we get no more feeding value. I like the cutter much better than the shredder, as it leaves the stalks in better shape for cattle picking them over. This is the third year I have had it done, each year a different machine, and this was the best, leaving stalks well mashed and cut up, and much of the fodder in longer length, and it blew it right up to peak of barn, so required no one to level it all the time and throw back as with elevators. J. E. S.

New Jersey.

A STATE AIDED NUISANCE.—I have been interested in the discussion of game laws, and wonder whether our Vermont man, page 738, may not find some hint in a story told me by a neighbor. A man in Iowa was bothered by the prairie chickens, which were doing much damage to his corn. At last he began shooting them, was arrested, pleaded guilty and fined. He paid his fine, but began suit against the State for damages, and got them on the ground that as the State protected the birds it must pay the damage caused by them. Your correspondent, who speaks of the will of the majority in respect to the game laws, seems to me to be astray. In this State the game laws are dictated and engineered through the Legislature by a few rod and gun clubs for their own benefit. I believe if the farmers would act in unison the objectionable features could be done away with. Again, the question of the right of the State to force a nuisance upon one class to provide for the enjoyment of another. It seems to me it comes under a different head from abating a nuisance for the benefit of the public. S. T. W.

GLENN RANCH,

Glenn County, California,

FOR SALE IN SUBDIVISIONS.

This famous and well-known farm, the home of the late Dr. Glenn, "the wheat king," has been surveyed and subdivided. It is offered for sale in any sized government subdivision at remarkably low prices, and in no case, it is believed, exceeding what it is assessed for County and State taxation purposes.

This great ranch of 40,000 acres runs up and down the western bank of the Sacramento River for 15 miles. It is located in a region that has never lacked an ample rainfall, and no irrigation is required.

The river is navigable at all seasons of the year, and freight and trading boats make regular trips.

The closest personal inspection of the land by proposed purchasers is invited. Parties desiring to look at the land should go to Chico, California.

For further particulars and for maps, showing the subdivisions and prices per acre, address personally or by letter,

F. C. LUSK,

Agent of N. D. Rideout, Administrator of the Estate of H. J. Glenn, of Chico, Butte County, California.

PROFITABLE WINTER WORK
You can make big money taking orders for and selling my SEEDS in your section. New plan, quick sales, splendid outfit. Agents, Farmers, Gardeners and others write to-day for terms, etc.

Registered Berkshires.
I have for sale young Boars and Gelts that weigh over one pound for each day old; farrowed in May and June last. No better bred stock living. Address J. E. WATSON, "Springbank," Marbledale P. O., Ct.

Cider Machinery.—Send for catalogue to Boomer & Boschert Press Co., 118 West Water St., Syracuse, N. Y.

Oldest Commission House in New York. Established 1838. Butter, cheese, eggs, pork, poultry, dressed calves, game, &c E. B. WOODWARD, 302 Greenwich Street, New York

POULTRY SHIPPERS.
We make a specialty during the Winter months of **handling Poultry**, having a very extensive trade. **Write** us for any information you may wish regarding dressing, packing, etc., and we will be pleased to answer all inquiries.
Returns made on sale of each shipment.
ARCHDEACON & CO., 100 Murray Street, New York.

How to Drain Land Profitably.
On every farm there is probably some land that could be made more productive by underdrainage. Properly drained land can always be worked earlier, and more profitably. The best and most economical way to drain is explained in the book, "Benefits of Drainage and How to Drain," which is sent *free* by JOHN H. JACKSON, 76 Third Avenue, Albany, N. Y.

ROUND TILE

GRINDS EAR CORN, SHELLED CORN, OATS, RYE, BARLEY, KAFFIR CORN, ETC.
Fine or coarse, for feed or family purposes. Has **shake feed. Burrs** are made of white metal, so hard that neither file nor tool will touch them. They will open and let nails or hard substances through without breakage. We furnish this mill with or without crushers and elevators.
CAPACITY 10 to 45 bu. an hr., according to power used, kind of grain and fineness you grind. The only mill that grinds ear corn and all other grain successfully. With 2, 4 or 6 H. P. Made in 3 sizes for power up to 12 horse. **Guaranteed** to grind more ear corn than any mill made with same power, because crusher and grinding plates are on separate shafts, reducing friction. We have 40 styles of grinders, adapted to power wind mills, engines and horse powers of all sizes. We also furnish powers of all kinds for driving all kinds of machinery. Write for our Large Free Catalogue of 15,000 other articles.

Marvin Smith Co., 55-59 N. Jefferson St., Chicago, Ills.

As We Go to Press.

A GOOD TURN.

During the past few weeks we have received letters from Maine, Maryland, Pennsylvania, Ohio and New Jersey, of which the following is a fair specimen:

Thinking that one good turn deserves another, as you so kindly answered my query in regard to the shredder business, I retaliate by renewing my subscription and sending you another. R. R. B.
Pennsylvania.

This man sent $2 and the name of a neighbor. The Maryland man sent the money and names with his question. He was so confident that THE R. N.-Y. would do its part that he got in his "good turn" ahead. The Maine man did his good turn on general principles, for he says that he helps the business of farming whenever he helps increase the circulation of THE R. N.-Y.

Such little things are very encouraging. The best of it all is the thought that our friends are ready to help without any urging on our part. They know that we are prepared to turn the crank when such a turn will do them good. They are not selfish enough to pocket all the good, but they proceed to turn a notch on our subscription list. There is another side to all this, too. Every dollar we get for subscriptions helps us to stand close to the interests of our *subscribers*. Where a paper is forced to depend largely upon political patronage or advertisements for support no one can expect that it will put the interests of its readers ahead. THE R. N.-Y. is published for its subscribers first of all, and thus the man who picks up a new subscriber not only benefits his friend, but indirectly benefits himself.

BOOK BULLETIN.

THE FORCING BOOK, by L. H. Bailey. A full description of the appliances and methods necessary for the cultivation of fruits and vegetables in glass houses, with list of plants which can be grown in this way to advantage; 266 pages, illustrated. Price, postpaid, $1.

THE NEW RHUBARB CULTURE, by J. E. Morse. A guide to the field culture and Winter forcing of rhubarb, giving the experience of practical growers in various parts of the country. Numerous receipes for preparing this plant for table use. Price, postpaid, 50 cents.

CUT-PRICE BOOKS.—Any of these 20-cent pamphlets mailed postpaid for 10 cents:

Milk Making and Marketing.
Country Roads.
Chemicals and Clover.
Fertilizer Farming.
Memory Training.
Cooking Cauliflower.

THE RURAL NEW-YORKER,
409 Pearl St., New York.

MARKET NOTES

BUTTER.—Extra creamery is selling at the same figure as last year, 25½ cents, and occasionally a superior lot brings a half-cent more. The June creamery now being received appears to have kept unusually well. The exports from this city since May 1 amount to nearly 7,000,000 pounds.

HAY.—Trade is quiet at present, the most active item being clover mixed, a grade which is always popular for general feeding purposes. Very little strictly prime hay is received, a large part of what is shipped for prime being graded here as No. 1. Rye straw shows a very wide range on account of the quantity of poor stuff offered. Long bright straw would bring 80 cents per hundred. There is practically no sale for oat straw at prices which will pay for shipment.

THANKSGIVING SPECIALTIES.—Turkeys and chickens do not have a monopoly of this business of helping people to express their annual thankfulness, for what is Thanksgiving without pumpkin pie, cranberries, grapes, celery or cress? There is great activity in the trade in these products. Cranberries, celery and grapes are the chief items, and large quantities are shipped to out-of-town points. Some business is done in greens for decorations, but this is a small item as compared with the Christmas trade. Prices on the better grades of cranberries are as high as $7.50 per barrel. Figures on celery are moderate, running from 10 to 40 cents per dozen roots. Considerable tough, stringy and inferior stuff is disposed of, and an attempt to eat it is likely to make one wish for the machinery with which the cow grinds her hay and cornstalks. There is still plenty of grapes in the market, Catawba, Concord and Niagara. They retail at 20 to 25 cents per four-pound basket. They lose in flavor by storage, and more or less withered and decayed ones are found in every basket.

DRESSED POULTRY.—Many shippers who previously sent their poultry for the holiday trade dry packed now ice it. This is on account of the severe losses they have had owing to warm weather in transit. As a result there was a real scarcity of dry poultry, and high figures were obtained. After the rain of Monday the weather was clear and cold, and in every way favorable for handling poultry. Local retailers were slow in stocking up, waiting until the last minute to see whether later receipts would not bring prices down. Out-of-town buyers were on hand, and considerable business was done in this line. Large quantities of poultry are every year re-shipped from New York to towns within a radius of 50 to 100 miles. Of course, poultry is brought into these places by neighboring farmers, but, unless dealers engage it in advance, they never know just how much they can get. Many dealers prefer to order supplies direct from New York, as they then know just what they will have and when it will come, although this is a rather roundabout way of getting at it, and the poultry is inferior to that fresh killed. Iced poultry was plentiful, 11 cents being an extreme price for both turkeys and chickens, while dry packed brought as high as 14 to 15 cents. As is usually the case there was a surplus of low-grade stuff. No matter how fine poultry may be when shipped, icing injures its appearance and sale. When opened it is wet and slippery, and no amount of wiping and fixing up can remove the white-livered look and disagreeable odor that it gets by being soaked with the melting ice. W. W. H.

Robbing Bumblebees' Nests.

In his admirable work, "The Insect Book," Dr. L. O. Howard gives the following interesting story: "Marlatt, in the proceedings of the Entomological Society of Washington, tells how the boys in Kansas avoid stings and gather honey. He said that they (and he was one of them) were led to rob these nests more from the excitement caused by the danger of being stung than to secure the honey, which, in fact, was not only rank and unpalatable, but in the early Fall, during the haying season, was small in quantity. The method followed was to take a one or two-gallon jug, such as is commonly used to carry water to haymakers, fill it partly with water and place it, with cork removed, within two or three feet of the nest. The bees were then thoroughly aroused by beating the nest, immediately after which the brave boys removed themselves to a safe distance. The enraged bees would swarm out and begin flying about in widening circles to discover the enemy. The jug would at once attract their attention and numbers would fly about it and over its open mouth, which, by reason of the air set in motion by their wings, would give an answering roar to their angry humming. Excited beyond measure by this noise, the bees would fly at the mouth of the jug, and one after another would pop into it (the noise produced by those within still further attracting those without), until all had entered. A second disturbance of the nest would serve to draw out and dispose of any remaining fighting worker bees, after which the robbing of the nest was easy. After robbing the nest the water and bees in the jug were emptied out on the ground, and the bees, although apparently drowned, would soon recover, and start off to found new colonies, which other boys would probably rob. In later years, when Mr. Marlatt became interested in collection and study of insects, this method was employed with unvarying success in the examination of bumblebees' nests, in order to secure parasites and the guest insects which inhabit these nests. This method seems to be a discovery of the western farm boys, since the writer, although he robbed bumblebees' nests in central New York when a boy, was never ingenious enough to invent such a capital method of avoiding stings."

Report of Secretary of Agriculture.

Following is a synopsis of Secretary Wilson's report for the year ending June 30, 1901:

Rural delivery has aided in getting weather forecasts promptly to farmers, 42,000 families having received these reports. It is expected to extend this service during the coming year, giving warning of approaching frosts and storms in time to be of real service. The value of animals exported was $253,000,000. Inspectors have examined 385,000 cattle, 228,000 sheep, and 48,000 horses and mules for export, and 37,000,000 animals for slaughter in this country. Animal diseases are being treated by vaccines sent out by the Department. Special studies in plant diseases have been made to learn resistant varieties, and various commercial seeds were tested for germination. Valuable seeds and plants adapted to our climate have been imported, including macaroni wheats, date palms and Egyptian cotton. About 4,500 pounds of tea were raised on the experimental farm at Summerville, S. C. Efforts are being made to extend our foreign fruit trade, particularly in high-grade apples. Investigations have been made of the composition, nutritive value and adulteration of food products. Extensive work has been done in forestry, both in improving Government lands and in advising private owners of the best means of handling their forests. Commercial trees, tree planting, forest fires, forest productions and lumbering are discussed. Experiment stations have been established in Hawaii and Alaska, and arrangements are being made to carry on this work in Porto Rico and the Philippines. Agricultural education by college extension work has made decided gains. Farmers' Institutes are held in 43 States and Territories. Irrigation and improvements of the grazing lands of the West have received increased attention. In the work in entomology is noted the introduction of numerous useful insects, such as the fig-fertilizing insect, and several natural enemies of pernicious plant pests. Object lessons in road making have been given. Sample roads were built in nine States under the direction of the Department. The machines were loaned by the manufacturers, railroads carried them free, and the local communities furnished the materials and labor. The publications issued amounted to nearly 8,000,000 copies. Of these 3,500,000 were farmers' bulletins. The value of all agricultural products exported was $950,000,000. Of all the merchandise sent abroad 65 per cent originated on the farm. The amount appropriated by Congress for the work of the Department for the year was $3,303,500.

RAKING LEAVES.—I made my leaf carrier of two-inch mesh poultry wire six feet wide by eight feet long, nailing two fairly heavy cedar stakes to each end. I laid the wire out flat and raked until I got a large heap of leaves on it; I then took one end and drew it toward the center and did with the other end likewise, thus rolling the leaves very tight and enabling me to carry a large load.
Westfield, N. J., C. H. K., JR.

A Liberal Proposition.

Thrice-a-Week World and The Rural New-Yorker { **$1.65** A YEAR

One of our special offers is the Thrice-a-Week World and The Rural New-Yorker combined for $1.65 a year. By this arrangement you are sure to obtain all the news of the day, and information of special interest to the farm and home at the same time. The Thrice-a-Week World is a clean, reliable newspaper, and the low figure at which it is offered, in conjunction with The Rural New-Yorker, should make the combination unusually attractive.

STEVENS
Anti-friction, Bridge tree, Automatic adjusting, Self-sharpening, Covered gears, Light draft, Non-choking Hand, Sweep, and Power farm mills, for all purposes. Will grind all grain to any degree of fineness. Thousands in daily use everywhere. Send for free catalogue C. Agents wanted.
STEVENS MFG. CO.,
Fisher Bldg., Chicago, Ill.

WELL DRILLING Machines
Over 70 sizes and styles, for drilling either deep or shallow wells in any kind of soil or rock. Mounted on wheels or on sills. With engines or horse powers. Strong, simple and durable Any mechanic can operate them easily. Send for catalog.
WILLIAMS BROS., Ithaca, N. Y.

BRAND NEW STEEL ROOFING

Bought at Receivers' Sale. Sheets either flat, corrugated or "V" crimped. No tools except a hatchet or hammer is needed to lay the roofing. We furnish free with each order enough paint to cover and nails to lay. Price per square, **$1.75**
A square means 100 square ft. Write for Free Catalogue No. 57 on General Merchandise. Chicago House Wrecking Co., West 35th and Iron Sts., Chicago, Ill.

Clubbing List.

We can save you money on any paper or magazine. We give you a list below. If you do not find all you want here, send us a list, and we will quote you price by return mail. It will save you trouble to send all your orders to us at one time. The price opposite each paper is our price to you for it. Every order must, of course, include a subscription to THE RURAL NEW-YORKER at $1. To make up a list start with THE R. N.-Y. at $1, then take as many of the others as you need at price opposite each.

MAKING SKIM-MILK CHEESE.

How many quarts of skim-milk does it take to make one pound of cheese? What is it worth per pound? W. B. B.
East Greenwich, R. I.

To embark in the manufacture of skim cheese you will require the services of a skilled man. More skill and judgment are required than in the manufacture of a full cream cheese, because the effort put forth from first to last is to assimilate water in the place of fat removed. Only the very finest quality of milk can be safely used; that is, milk free from objectionable gases or taint germs. Any gas development is very hard to manage after removing the fat, which is the life and heart of milk. The quantity of milk required for a pound will depend upon the amount of fat remaining and the casein content of the milk. If you have 3.8 per cent milk, which will require about 10 pounds for a pound of cheese, full cream, and we remove all of the fat, we have left casein only. Dry casein will assimilate nearly 2½ times its own weight of water; in other words, if we have 3.8 per cent fat in the original milk, the same milk would contain about 3.1 per cent casein; .2 of a pound would be wasted in the manipulation, leaving 2.9 per cent. This, multiplied by 2½ would give us 7.25, the amount of cheese in 100 pounds of the original milk. This will vary somewhat in milk of similar composition, on account of varying degrees of water assimilated.

Milk of this kind should be set at 88 to 90 degrees Fahrenheit, and not heated after cutting to exceed four degrees, and good results can often be obtained without any further increase in temperature. The skill of the maker alone can determine. Only a slight trace of acid should be given the curd when drawing the whey, and stirred gently, salted at the rate of one pound to 1,000 of milk, pressed, and cured at 60 degrees, not over 65. After all of this effort the market will pay from two to five cents a pound; with beginners usually the minimum price. In my experience and observation skim-milk is worth more to feed than to use in any other form. Very many so-called quarter skims are made, and are a very eatable cheese when properly made, and are profitable when prices are high. If the retailer is forced to raise his price above 15 to 17 cents, as he generally does when cheese is selling at 12 cents in the country, he often meets the objection that prices are too high. His only alternative therefore is to buy a light skim, known in the New York market as "store cheese" at from one to two cents less, and thus holds for the time at least, his trade. The objection to these cheeses is found in their rapid drying out. The fat being out, the maker tries to make the cheese soft, so assimilates all the water he dare to put in, and not have free moisture. Until cut the rind prevents rapid evaporation, but after being exposed to the air the water passes out rapidly, and this all happens in the hands of the consumer. We have fooled the trade and the final buyer as a buyer, but as a consumer he knows just what he has on hand. To give every detail would re- 10 columns of THE R. N.-Y.

H. E. COOK.

...NING OUT HOG CHOLERA.

be done to clear the disease ...s in which hogs have died

hogpens are so con- ...lete disinfection is In such cases, the burned or torn ...t to discontinue ...ecanse if they ... cholera this ...nembers on the ...ts, boots of men, etc. A great deal of the so-called disinfection is worthless, and worse than worthless; worthless, because it does not destroy the disease germs that it is intended to destroy, and worse than worthless because it gives a false sense of security. The best disinfectant is fire, the next best is cleanliness, the next best is sunshine and following these come chemicals for destroying germ life. All of the loose bedding and dry manure, together with loose boards and rotten woodwork about an infected pigpen, should be gathered together and burned. The loose manure and soft earth from the yards and from beneath the buildings should be buried two feet below the surface. The pens themselves should be scrubbed out with hot water and washing soda. All of the doors and windows should be kept open to admit sunshine and fresh air; following this, all of the woodwork and fixtures should be sprayed with a five-per-cent solution of carbolic acid applied by means of a spray pump, such as is used for spraying fruit trees. This solution should cover every square inch of surface, and should get into every crack. Following this the same surfaces should be sprayed with whitewash containing chloride of lime; one pound of chloride of lime to each two gallons of whitewash. The gutters, the floors, the space beneath the floors and the yards should be flooded with a saturated solution of sulphate of iron. Disinfection that has been carried out in this way has in numerous cases that have come under my observation been entirely effective in preventing a return of hog cholera from infected premises. A source of considerable danger that should not be overlooked, is the hog that has apparently recovered from cholera. Chronic ulcerated processes sometimes remain in the bowels for a long time, and after the hog appears to have regained perfect health, it may still be discharging germs of hog cholera in its manure.

Pennsylvania. LEONARD PEARSON.

The germ of hog cholera is no more difficult to destroy by germicides than most germs of other infectious diseases. Proper disinfection depends upon the construction of the building. A comparatively new building with a cement floor, or even a tight board floor, may be disinfected without much difficulty, while if the building is old, with a ground floor, it will be difficult to do this. To burn it would be the safer and better way to disinfect, as the chances are that the germs would never all of them be reached by whatever germicide was used. With tight floors and sound sides of wood, stone or brick a five-per-cent solution of carbolic acid used in water near the boiling point will kill the germs. This can be applied with an old broom or a mop made of cloths. The user should wear old boots that can be burned and clothing that can be washed by boiling when he is through with his work. Chloro-naptholeum or any of the so-called sheep dips can be used and take the place of the acid; also a preparation called by its manufacturers Baccillol. In most cases these last-named are cheaper than the carbolic acid, of which the pure should be used, the crude being of too uncertain strength to depend upon. Again, referring to the clothing worn by those who care for infected swine, I will say that in my opinion there is no more ready means to spread the disease in communities than for people to visit the place where swine are suffering with the disease, and then without changing all outer garments and boots or shoes go among other swine. Hog holera has been known to be conveyed for 100 or more miles by those who had simply walked among diseased swine, and without changing their boots visited other swine herds. It is a disease that need not spread over large areas, if people would practice the precautions mentioned. C. D. SMEAD.

Logan, N. Y.

Purebred Jersey Oxen.

The picture at Fig. 372, page 819, shows two purebred Jerseys of the finest breeding adding a little dignity to labor. The engraving is taken from The Jersey Bulletin, the excellent publication which champions the Jersey breed. Jersey oxen are seldom seen, yet they are quick and active, if light, and on many farms a yoke of such cattle would prove very useful. On our steep hill farm we think the active Jerseys would be more useful than the duller and heavier breeds. Surely nothing could be handsomer, under the yoke, than these fawn-colored workers.

HEN FEEDING.—It has always been my practice to feed my hens from a tin dish holding about 1½ pint. This dish full of oats and cracked corn, half and half, to eight hens. I have weighed this grain lately, and I find I am feeding about 2¾ ounces of dry grain to each hen for supper. They get the same measure full of a mash of bran and meat meal in the morning. I have come to the conclusion that it is the same with hens as with humans; no matter how you feed, some will be fat and some will be lean. V. E. H.

Lakeport, N. H.

"An ounce of prevention is worth a pound of cure." That is the way with a Cold. A few little doses of Dr. D. Jayne's Expectorant often saves a long sickness, if not something more serious.—*Adv.*

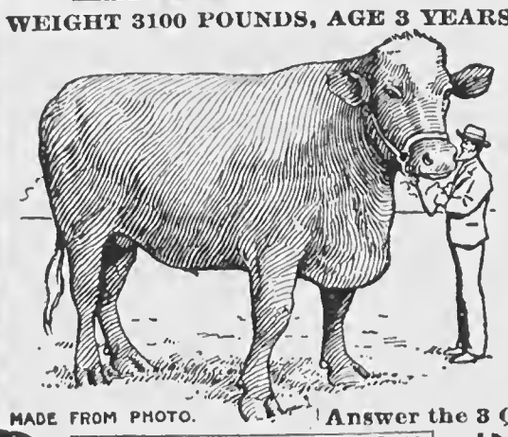
You Can Save Your Horse
from Spavin, Ringbone, Splints, Curbs and all forms of Lameness by a prompt and liberal application of that old reliable and well known remedy—

Kendall's Spavin Cure
It has the unqualified endorsement of every man who has ever used it. Here is a sample of what thousands say for it.

CURED FIVE BONE SPAVINS.
Montrose, Colo., July 14, 1899.
Dr. B. J. Kendall Co., Dear Sirs:—Please send me one of your "Treatise on the Horse." Your Kendall's Spavin Cure is the best in all the world. I have cured five bone spavins on my horses and would not be without it for anything. Yours truly, G. W. ROBUCK.

It is a most valuable liniment for family use—splendid for bruises, sprains, lame back, rheumatism, etc., etc. Sold by all druggists at $1; six bottles for $5. Our book, "A Treatise on the Horse," mailed free. Write at once and address
DR. B. J. KENDALL CO., Enosburg Falls, Vt.

LARGEST THREE YEAR OLD STEER IN THE WORLD
WEIGHT 3100 POUNDS, AGE 3 YEARS, SHORTHORN.



MADE FROM PHOTO.

Owned by International Food Co., Minneapolis, Minn., U. S. A. We feed "INTERNATIONAL STOCK FOOD" every day to our four Stallions, Brood Mares, Colts, etc. "INTERNATIONAL STOCK FOOD" causes Horses, Cattle, Hogs and Sheep to grow very rapidly and makes them Big, Fat and Healthy. Is used and strongly endorsed by over 500,000 Farmers. It is sold on a Spot Cash Guarantee to Refund Your Money in any case of failure by over 30,000 Dealers. It will make you extra money in Growing, Fattening or Milking. Owing to its blood purifying and stimulating tonic effects it Cures or Prevents Disease. It is a safe vegetable medicinal preparation to be fed in small sized feeds in connection with the regular grain. It Fattens Stock in 30 to 60 Days less time, because it aids Digestion and Assimilation. In this way it saves a large amount of Grain. The use of "INTERNATIONAL STOCK FOOD" only costs 3 FEEDS for ONE CENT. Ask your dealer for it and refuse any of the many substitutes or imitations. It always pays to feed the best. "INTERNATIONAL STOCK FOOD" is endorsed by over 100 leading Farm Papers.

A $3000.00 STOCK BOOK FREE
MAILED TO EVERY READER OF THIS PAPER.
This Book Contains 183 Large Colored Engravings of Horses, Cattle, Sheep, Hogs, Poultry, etc., and of this Steer. It cost us $3000 to have our Artists and Engravers make them. It contains a timely illustrated Veterinary Department that will save you Hundreds of Dollars. Gives description and history of the Breeds of Horses, Cattle, Sheep, Hogs and Poultry.

THIS BOOK FREE, Postage Prepaid, If You Write Us a Postal Card and Answer 3 Questions:
1st—Name this Paper. 2nd—How much stock have you? 3rd—Did you ever use "INTERNATIONAL STOCK FOOD" for Horses, Cattle, Sheep, Hogs, Colts, Calves, Lambs or Pigs. The Editor of this Paper will tell you that you ought to have a copy of our finely illustrated Book for reference. We will give you $14.00 worth of "INTERNATIONAL STOCK FOOD" if Book is not exactly as represented. We Won the Highest Medal at Paris in 1900.

3 FEEDS FOR ONE CENT

FEEDING BONE MEAL TO COWS.

Have you ever found it necessary to feed fine ground bone to milch cows? We are told that under some circumstances, especially where cows are fed largely on corn, that a light feeding of bone meal will prove very useful. I know from my own experience that this is true in feeding hogs, but we would like to know whether the same thing is true in feeding cows.

I feed my cows a small amount of ground bone about three times a week, during the Winter. Several years ago I was troubled with abortion in my herd, but since feeding as above it has not appeared. I do not hold that it is a remedy, however. J. S. WHITEFORD.

Maryland.

We have fed, very successfully, boiled, specially-prepared bone meal to cattle, especially to young, growing stock. Without a doubt it is valuable to feed to dairy stock, especially if much carbohydrate grain is fed. It can be successfully fed with cornmeal or any food high in carbohydrates. W. M. BENNINGER.

Pennsylvania.

I have never experimented with ground bone, however, I am impressed with the belief that under certain conditions, an occasional feed would be beneficial. This opinion is partly based on the fact that I have very often seen cows greedily chew bones, and I have known cows to be choked by so doing.

Pennsylvania. JAS. L. HENDERSON.

Feed for Cows and Horses.

Referring to the question from Connecticut about feeding cows and horses (page 814) one of the best dairymen in this county says that the best feed to produce milk is six parts wheat feed to one part gluten. The wheat feed was what is called "mixed feed"; that is, bran and middlings together. One gets it in this way. The wheat feed he weighs, six pounds at a feeding, morning and night, with one quart of gluten at each feeding. This ration is for large Holstein cattle; for Jerseys it would probably be a rather heavy ration. His other feed was cornstalks, hay and millet. The inquirer from Connecticut says he has plenty of corn. If he will take his corn in the car, have it ground fine, cob and corn together, take four quarts of this cob meal, and four quarts of his wheat feed and mix them together for each feeding, he will find this a good ration for milk production. The coarser wheat feeds are better for milk than the flour middlings. A good ration for work horses is wheat feed of any kind, with a little cornmeal; say three quarts of wheat feed and one quart cornmeal, three times a day. I give my own horses ground rye and oats, half and half by measure, 12 quarts a day, and my horses work hard every day. G. W. H.

Columbia Co., N. Y.

Daily Rations for Hens.

I have never measured or weighed the grain required by a hen each day. In my experience the amount of grain a hen seems to require daily varies greatly, depending on the season and condition of the bird. For instance, when a hen is moulting she will seldom eat much more than half the amount she will when laying her best. My rule is to feed all they will take up promptly and with relish, except in the morning, when I give a scant ration.

New York. H. J. BLANCHARD.

We have two or three most excellent cows, the result of crossing the Holstein upon the Jersey, and in another case the Jersey male on the Holstein. The latter cross appears to be preferable, and I see no reason why a variety of animals might not be produced which would give a larger amount of milk than the Jerseys, and richer milk than the Holsteins. Of course we would get a great mixture of colors. Our experience is that the tendency is to produce animals that are quite dark, but I think this would soon disappear after a generation or so. The Holstein male, when bred to common stock, in our experience, tends to produce offspring that are darker colored than either the sire or dam. By many the Holstein cow is considered a little large, and the Jersey cow often too small and delicate. The cross-bred animal should be one that is intermediate between these two prominent characteristics of the breeds named. Of course it would take a little while to get the blood mixed harmoniously, because both breeds are strong ones, but when success is attained an ideal cow should be the reesult. I. P. ROBERTS.

Notes from Milk Producers.

The two milk-receiving stations at this place are taking in quite a large amount of milk for the time of year; the Tuttle station receiving about 55 cans daily and the White station about 45 cans. Prices range from $1.10 to $1.25 for 40-quart can, according to the test of butter fat; 10 cents per can is added to the above prices if the producer delivers two-thirds as much milk during the months of November and December as was delivered during June. These prices are considerably higher than formerly paid at this place, on account of competition, although the actual profit is but very little better on account of the higher cost of feed, it being from one-third to one-half higher than usual. Wheat bran is selling at $22 per ton, and cornmeal $27 per ton. W. J. W.

Cobleskill, N. Y.

Milk is $1 per can of 40 quarts at the local station, when it should be at least $1.20 per can, taking into consideration the price of the feeds for milch cows. A number of the farmers in this section raise a great many turnips for Fall and early Winter feed, which materially reduce their feed bills. They are mostly raised with corn sown at the same time; the corn is drilled or planted by mixing the seed with the fertilizer. One of our progressive farmers has fed two wagon-loads a day since July 15, and has 1,000 bushels in the cellar for Winter feed. They are fed without cutting, simply pulled and scattered in lot or manger just after milking. The kind principally grown is the Strap-leaf Purple-top for Fall and the Germain Sweet for Winter. They are certainly great milk producers. Cows are very high; that is, nearby springers from $40 to $65 each. More turnips will be raised in this locality next year than ever before. B.

McGraw, N. Y.

It would seem the milk business has reached a situation where the margin of profit (if such there be), if seen, will have to be looked at through a microscope. With meal selling at $25 to $28 per ton, and bran and middlings proportionately high, a fair quality of hay selling readily for $12, how is it possible to make milk at the present prices? The Horseheads Creamery Company is receiving about 700 quarts of milk daily from this place. Such of the patrons as are paid "station" prices are receiving at this time 94 cents for 40-quart cans, this being the net price in this zone. Of course, the price of hay has little or nothing to do with the cost of milk, as very little hay is being fed these days. It is the corn fodder that makes it possible for the dairyman to exist. Corn in this vicinity made a most magnificent growth, and the fodder kinds were especially well cared. Hundreds of bushels of fine ears went into the silos, and are now safely housed till such time as needed. I hear of a number of cows being offered for sale.

Erin, N. Y. G. E. M.

LEGHORN HENS.—The Mediterranean varieties will probably stand more abuse in the matter of overfeeding than will the larger breeds. It is claimed by physiologists that nervous persons should eat largely of animal food. The Leghorns represent this temperament among fowls, and I am accustomed to make their daily ration partly of meat regularly. F. W. P.

THE HEN'S MASH.—I would like to dispense with mashes for poultry altogether, but for the difficulty in getting the meat ration properly fed out. When some enterprising firm puts up a choice article of lean meat screened to the proper size to throw into the litter, and at a reasonable cost, I shall be glad to dispense with mashes, as I believe them to result in less action of crop and gizzard and diminished vigor. F. W. PROCTOR.

Can You

do a little pleasant and profitable work for us in your own town? No experience necessary. We will explain just what you have to do. The work will be light, and we will arrange for the time you shall be able to give to it. We can give you work for all your time or just for your spare time. Write for full particulars. THE RURAL NEW-YORKER, NEW YORK.

Juggling of Separator Facts

— AT THE —

BUFFALO EXPOSITION.

One of our desperate would-be competitors persists in its unscrupulous juggling of Separator facts and records at the Buffalo Exposition. One lie or misrepresentation stamped out it bobs up the next week with another. But everything must come to an end, and as a correspondent pertinently writes us "long after both these second-rate imitating machines and their projectors are turned into poor fertilizer the De Laval will continue—as in the past—to demonstrate its all-round superiority to anything else ever made in the shape of a cream separator."

The De Laval Cream Separators having been awarded the Gold Medal at Buffalo and the concern in question a gold medal on its *combined exhibit* of churns, separators and Babcock testers, it at once brazenly advertises having received "the Gold Medal and Highest Award" on its "separators," without qualification, in the hope to thus influence some possible separator buyer.

Next it proceeds to put out what purports to be a skim-milk record of the work done by the "U. S." machines in the Model Dairy at Buffalo. As a matter of fact this is not a record of the full run of the machines but simply of a selected part of it. Much of the "U. S." work during the first month of their run would not compare favorably with ordinary gravity setting. It was so bad that one machine was thrown out altogether. Their average for the full time shows a skim-milk loss of *nearly three times* the published figures.

Even then these so-called "skim-milk" records were but mere jugglery and show absolutely nothing as to the practical work of the machines. These "records" were achieved only through excessive speed, excessive power, cutting down capacity and running so thin a cream that more fat was lost in churning than saved in separating. The following voluntary statement from the engineer of the Model Dairy tells its own story in this regard:

BUFFALO, N. Y., November 2, 1901.

THE DE LAVAL SEPARATOR CO.,
74 Cortlandt St., New York, N. Y.

Gentlemen:—As engineer of the Model Dairy at the Pan-American Exposition, Buffalo, I was impressed with the following points of merit in the running of your Cream Separator. It did its work very smoothly and quietly, showing by its running its mechanical excellence. I could run it with a much smaller consumption of fuel and lower steam pressure. In fact, it took *but one-fourth as much steam to do our work with it as the "United States" separator used to do the same work*, and at no time did I have to force my fire or boiler to keep up the supply of steam as I did when the latter machine was in use.

We were sorry to see the De Laval leave on June 28 and glad to see it returned on August 9th, as it made less labor for all. Your representatives let the regular Dairy force handle it, while your competitor, the "United States," *had an expert to run their machine during the greater part of the time of their run*, and even then he could not make a record for close skimming *except by running his machine at an excessive speed of* 11,000 *to* 12,000 *revolutions a minute, cutting down the capacity, and making a thin cream.* One morning in particular the cream was so thin that I had to run the churn two hours and twenty minutes before the churning was done.

While I am not an expert in creamery work, I hold a first-class engineer's license, and I want to say that your separator, from a mechanical standpoint, in the design and finish of the parts and in the economy of fuel and labor, *easily ranks first*, and I do not wonder that your competitors would rather not place their machines alongside yours.

Yours very truly,
JAMES F. DOWNY,
Engineer Model Dairy.

The published records of the De Laval machine in the Model Dairy at Buffalo were made *under practical use* conditions, such as may be duplicated by any De Laval machine in everyday use, and the machine was run by the Exposition employes themselves and not by a manipulating expert juggling for "skim-milk" records.

SEPARATOR AWARDS
AT
BUFFALO EXPOSITION
AND OTHER
INTERNATIONAL EXPOSITIONS

The United States Separator awarded Gold Medal at Buffalo and excelled all others in separating the cream from the milk of the ten dairy herds in the *Model Dairy* at the Pan-American Exposition. The DeLaval Separator left 25 per cent. more fat in the skimmilk than the United States.
The United States Separator received medal and highest prize at the World's Fair, Chicago, 1893.

At the Paris Exposition the United States Separator received a Gold Medal.

The DeLaval Co. received no prize there. In their attempt to get around this, they advertise that the award they claim was the award given to the "Société Anonyme Separator," which they claim

"is the French translation of 'Separator Corporate Company,' the name of their European organization."

The "Société Anonyme Separator" exhibited a Butter Radiator. Their circulars read as follows:

"Le Radiateur produit directement du beurre pasteurise." The English translation is "The Radiator produces pasteurized butter direct from the milk." In this country this machine is called a "Butter Accumulator" or a "Butter Extractor."

The DeLaval Separators, like those sold by the DeLaval Company in this country, were exhibited at Paris in the name of the Aktiebolaget Separator. They had a very large exhibit, over 100 machines in two places. But regardless of these large exhibits the official list of awards distributed at Paris contained no award whatever to the DeLaval Co. or their European Co., the Aktiebolaget Separator. The name of the separator on the circulars they distributed at Paris is the Alfa-Laval.

The claim of the DeLaval Company that the award given to the "Société Anonyme Separator" was an award to them is an admission that none was given in their name or their European Company, the Aktiebolaget Separator.

The award which they now claim was on a machine making pasteurized butter direct from the milk and not a cream separator.

We ask all readers who, in their opinion, is the guilty party making "All sorts of lying and unscrupulous misrepresentations."

For further information about separator awards, we refer to the official published lists.

MULCHING FOR APPLE TREES.

WHY SOIL WARMS UP.

Best Plan for Spring Budding.

There has been so much interest shown in the account of that famous apple orchard owned by Grant G. Hitchings that we print more of his opinions:

You do not place much dependence on bud variation?

The theory seems all right, but as yet I have seen no distinct case of the variation being constant. I have noticed that the same tree will vary its fruit, some years being better than others, depending on the season and the supply of available plant food.

You lay great stress upon the need of humus in the soil. Why not keep this up by plowing under green crops as many recommend?

It occurs to me that we can keep up the humus supply much better and cheaper by adding it on top of a sod in the orchard, by letting what grows go back, and, if necessary, by growing Alfalfa in our back lots that are hard to cultivate, and drawing and applying that where needed. In starting a young orchard you can accumulate humus before the trees get large, and with this accumulation and what grows each year it seems to be sufficient to keep the trees producing good apples each season. How long it will last is of course a question. To guard against a possible shortage of humus last Spring I seeded down 20 acres to Alfalfa, and will use this as a mulch for strawberries, and if needed in the orchard.

What would you do with an old orchard?

In an old orchard the best thing to do to renovate it is first to tear up the old sod and decay it, then reseed and apply the cheapest available humus; if trees are close cut down one-half of them, and if you want to keep the orchard permanent set young trees near where old ones were cut. By applying the vegetable matter they appear to do just as well as those set on new ground. When these get to bearing cut down the remaining old trees and reset. By this method you are obtaining all the apples your ground is capable of, and gradually changing from an old orchard to a new one.

Are you not troubled in buying from nurserymen with trees untrue to name?

I never have had much trouble about trees proving untrue to name. In fact, I can tell a good many kinds by the trees; they have certain characteristics of growth and appearance that are reliable. I think the trouble is caused by buying of agents who claim they are selling certain nurserymen's trees, but in fact are buying where they can the cheapest.

What about root-pruning trees?

I agree perfectly with Mr. Stringfellow in his after treatment of trees. But there are two objections to the severe root pruning. First, in our stony soil, the tree may stand surrounded by stones, and second, after a year or two, when the tree is full of foliage, the wind would injure those fibrous roots more by rocking the tree than if they started eight or 10 inches from the body, the larger roots acting like an anchor to hold the trees until the new roots become well established, and of course the surface to heal would not be so large. This is only opinion, however; the method may be all right. The roots on apple trees go deep enough the other way of setting. In sinking stones I noticed roots from seven-year-old trees three feet below the surface in heavy clay. I believe the roots that do the tree the most good are near the surface, and I don't think it would be any better to start them deep unless you cultivate.

We hear reports from those who sow Alfalfa in their orchards. Is this good practice?

I would not grow Alfalfa in the orchard; it grows too vigorous in the Fall. It would rob the soil of available plant food at the time the trees needed it most. There are two orchards near here seeded with Alfalfa that I have watched all Summer. This Fall the trees showed very plainly that the Alfalfa robbed the trees of needed plant food. The aftermath of weeds and hay does not draw on the soil in the Fall like Alfalfa.

BUDDLEIA VARIABILIS. FIG. 375. SEE PAGE 838.

SPRING BUDDING.—G. H. R., page 804, will not be likely to succeed with the so-called Spring budding. If he will cut his trees down in early Spring before sap starts much, and let one young shoot grow, and June-bud that, he will succeed if it is properly done. The trees should be cut as close to the surface of the soil as possible. This can be done better by removing some of the soil, and cutting the stock off near the roots, so that too many shoots will not start. Let them grow until about six inches high, and then pull off all but the strongest and most upright, as early as it is possible to secure young shoots from the trees he wishes to get his buds from, say when they are six to eight inches long. No matter if they are soft, so that the buds are formed. Take them and put the buds in the young shoots from four to six inches from the ground. Be sure to leave a few leaves on the stock below the bud, and as soon as the bud is put in cut the top off within six or eight inches of the bud, so that there is some foliage below and more yet above the bud. Tie the bud in as in ordinary budding. We use common cotton twine, such as the merchant uses to tie up his sugar, etc. Let this remain about 12 days, and then cut the top off even with the bud. This will cause several shoots to start from the stock. When they have started out a few inches we go over and pinch or pull the tops off these shoots, so as to retard their growth and permit the bud to grow. After the bud is three or four inches long cut off all the shoots below it, and let the bud grow. The buds must be gone over the second time if they start out. By this treatment the orchardist will get good stocky trees from two to four feet or more, according to conditions. Buds can be obtained earlier from young orchard trees than from the nursery. The trees will be ready as soon as it is possible to get the buds. Ripe buds are not necessary in this case; no matter how young so that they are firm enough to be taken from the shoots. This is one of the surest modes of budding when conditions are at all favorable.

CHAS. BLACK.

New Jersey.

TEMPERATURE OF SOIL.—H. L. D., of Tennessee, page 774, makes a mistake in thinking that "the ground being compact, the sun did not penetrate, and the blooms were late." As a matter of fact, the heat rays penetrate compact soil much more readily than a cultivated surface. The loose soil acts as a shade and mulch, thus preventing the absorption of heat, for which reason we cultivate in Summer, as well as to prevent evaporation of moisture. I give an instance on page 32 of the New Horticulture, where I lost several hundred dollars on melons by disregarding these facts in early Spring. Experiments have shown that the temperature of the soil has little or nothing to do with the starting of tree growth in Spring. A grapevine planted on an outside border and trained into a hothouse, will leaf out the same time that one planted on the inside will. It is the temperature of the air and action of the sun on the branches that regulate Spring growth and blooming. The true reason of his success on the uncultivated crop was that the entire surface root system being let alone, his peach trees were able to resist the action of frost and hold on to their fruit, just as Grant G. Hitchings's apple trees do, when cultivated orchards around shed theirs. The well-known "June drop" of the peach is also due to continued destruction of growing surface roots by the cultivator. Who ever heard of "June drop" on trees standing in hard ground? As Mr. Hitchings says, the roots that do the tree most good are near the surface.

H. M. STRINGFELLOW.

EVERY HEN HER OWN STOVE.

New Plan for Housewarming.

I think it is probable that O. W. Mapes, of Middletown, has owned over 50,000 different hens during the last 15 years. That ought to give him a pretty fair insight into a hen's character and wants, particularly as he has studied Mrs. Biddy as few other men have. We have told the story of Mr. Mapes's poultry business so many times that older readers know that he keeps from 1,500 to 2,000 layers. They are kept in small houses scattered about a rocky farm on what is known as the "colony plan"—that is, there are no fences or runs and no large houses. Each little house shelters 50 to 60 hens. In Summer the hens all run together—each returning to its own little house at night. In Winter they are closely housed.

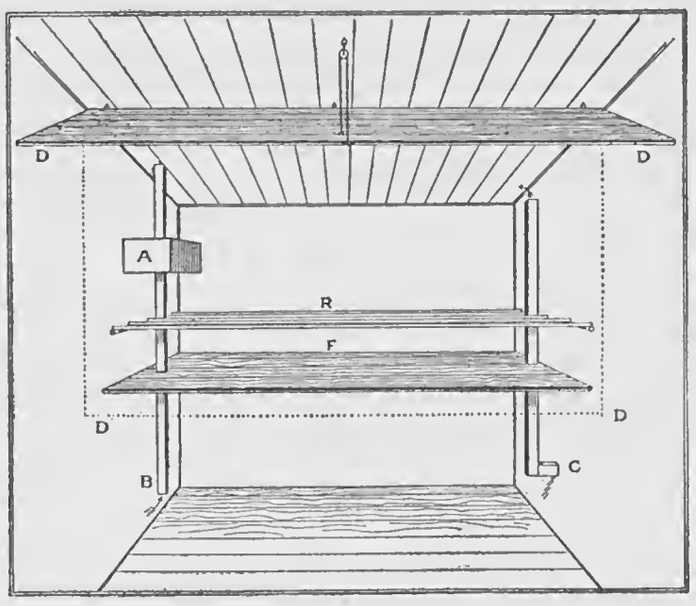
Mr. Mapes spent many years in trying to learn how to feed a hen properly. He thinks he knows, but he found, as most poultrymen do, that no matter how well you feed a hen she cannot do her best so long as she is chilled by the cold. You may set a greenhouse plant in the richest soil and feed it all it needs, yet if the temperature go too low the plant will not thrive. This same thing is true of a hen. You may feed her all the elements necessary to produce an egg, but if her feet are cold and her comb is nipped by the frost the egg will not be forthcoming. The little houses scattered over the farm are warmly built, of good material. They are comfortable in ordinary weather, but there are many weeks during the Winter when, if fair ventilation be given in the ordinary way, water will freeze in them, and that means frozen combs. Aside from the fact that no cold hen can be expected to lay well, Mr. Mapes believed that too large a share of the food went to supply animal heat. When you are feeding 2,000 cold hens this means something, and Mr. Mapes began to study the heat question as he had the food problem. Reports come now and then of houses in which stoves or steam have been used for heating, but even if they were satisfactory they could not be used in Mr. Mapes's system, for that would mean heating 40 separate houses.

"I have it at last—every hen her own stove."

That is what Mr. Mapes wrote after a long study of the problem and so, one cold night in November, I went up to see a hen act as a stove. It was quite cold enough to nip a nose or freeze the water in the average henhouse. After supper we started out to see the hens. As we opened the door of the first house not a hen could be seen. The room seemed to be cut in two. Investigation showed that a large hinged door or shutter just wide enough to play up and down inside of the house had been let down in front of the hens. There was just space enough at the bottom for a medium-sized man to crawl under. It was quite cold enough to freeze water in front of this shutter, but as we straightened up inside of it we found the air evidently warmer. The thermometer registered 52 degrees a little above the perches where the hens were roosting. Strange to say this warm air seemed as fresh and pure as the air outside—and the nose is a pretty good test in such matters! The hens were certainly keeping the air warm with the animal heat from their own bodies, but how was it possible to keep this air pure, without letting this heat escape? In order to understand what was going on, turn to the little picture at Fig. 376. We are supposed to be looking into the house. The arrangements are not exactly as here pictured, but the principle may be made clear. F is a platform under the perches, R. D D is the hinged door or shutter. When we entered the house this was down, covering the dotted lines so as to shut the hens into a little room by themselves. The space above the hens was boarded over and packed with straw to make all airtight and the sides were also perfectly closed.

As all know, 50 hens crowded into this small space would quickly warm it, yet if left there for any length of time many of them would die, and all would suffer because, without ventilation the oxygen of the air would be consumed. To overcome this Mr. Mapes had arranged the devices shown at A, B and C. B is a box of wood about five inches square. It starts about a foot from the floor of the house and runs into A, which is a larger box with sides of thin copper. Another section of B continues on from A—out through the roof. Now see what happens when D is shut down and the hens are on their roosts. As the air becomes warm the copper sides of A become slowly heated, while of course the wood of B is not affected. As a result the air inside A becomes warm, rises, and passes out through the opening to the roof. This creates a draft, so that air is sucked up through B from near the floor. This action keeps up as long as the heat around the copper at A is greater than that near the floor. At C is an opening from the outside with another wooden box running up to near the top of the house, or about a level with the hens. This intake is regulated by a slide so that the pure air is gently let in, supplying the place of the foul air sucked up through A and B. Thus the hens are shut in, away from severe drafts, and still supplied with pure air. As is well known, expired air is heavier than that taken into the lungs. In badly ventilated places the greatest danger is near the floor. You will observe that in this system of Mr. Mapes the air is sucked from the bottom so that little if any pure air is removed. To show the force of the air current at B, Mr. Mapes put a feather near it and this was sucked instantly up the box. The current of pure air at C was very gentle—creating no dangerous draft.

It would be hard to pick serious flaws in this system as it operated that cold night. Most henhouses are, I regret to say, so full of cracks and holes that the hen cannot possibly warm them, but for a tight house, where the hens can be tucked into bed behind a wooden shutter, they really seem to be able to carry their own stove around with them. Mr. Mapes says that he obtained the germ of his plan from a lecture on stable ventilation by H. E. Cook. With small animals like hens the barn system will not work—so he devised the scheme of crowding the hens together at night in the warmest possible place, and using the copper to pump out the foul air without creating a draft. I will try to tell about Mr. Mapes's new plan of feeding next week. H. W. C.



EVERY HEN HER OWN STOVE. Fig. 376.

FUTURE OF CULTIVATED CHESTNUTS.

Several years ago quite an interest was developed in growing Japan chestnuts for market. We should judge that many trees were planted, and it was thought that in a few years the markets would be well filled with these nuts. We do not find many of them on sale. What, in your opinion, is the cause of this apparent failure? Do you think chestnut culture will ever be a profitable enterprise in this country, and if not, why?

The Japan chestnuts have failed in Maine because of the rigorous climate. Several varieties were planted upon the station grounds in 1892, but none of them survived more than three years. The American species is grown in some parts of the State, and I believe that improved varieties of this class may be grown with profit, as there is a large demand for the nuts in the Fall and early Winter, and large quantities are shipped in from Massachusetts and New York.

"UNCLE DICK" HALEY. Fig. 377.

Maine. W. M. MUNSON.

Considerable grafting of the large varieties of chestnuts has been done here for several years past, and these grafted trees are now bearing. Some of them bear in two years from grafting. This present season the chestnut crop was exceedingly light all over the peninsula, as far as my observation extends. The local markets consume large quantities of these nuts at remunerative prices. I think it would take a very large crop of these nuts to make much difference in city supply, because so many are consumed at home. There has been no failure in this line, and it pays those who have the bearing trees.

Delaware. E. G. PACKARD.

While there are thousands of people interested in every section of the United States where the chestnut can be grown, the comparatively high price of the trees has deterred people from buying any number. Most of my customers I know have bought in lots from three to 10 trees; have cultivated liberally, but have cut away all the wood each year for grafting native chestnut sprouts, and so are obtaining little fruit as yet. The Japanese chestnuts unite more freely with our native stocks than do those having European blood like Paragon, Ridgely, etc., but even the Japans do not grow as readily as apples and other stocks easily grafted, and so it has been rather a slow process building up commercial orchards, and I think it will be some years yet before any considerable amount of the nuts are on the market. I had about 100 bushels of nuts in a five-year-old orchard in Georgia this year, but the warm weather when they matured in September down there, caused a large majority to turn rancid almost before we could get them into market. Those that did get to market in good order sold for $10 or $12 a bushel, which, of course, is an extreme price, but I believe the large size and great beauty and good quality of these nuts would have caused them all to sell at least $8 per bushel, had it not been for turning rancid as they did. I have had no trouble with these same varieties here in Connecticut. J. H. HALE.

Connecticut.

The fact that the large chestnuts like the Japan, Paragon and others are not more plentiful in the city markets may be due to several causes. The grafted trees have been and are still comparatively high priced, and somewhat uncertain to grow when transplanted. They seem to be more particular as to soil than most trees. Growers hesitate to plant largely for these reasons. Another reason why the nuts are not more plentiful is that the trees grow slowly, and the grower must wait quite a while before paying crops can be gathered. It requires quite a good-sized tree to produce a bushel or even half a bushel of nuts. The best method of getting a paying orchard seems to be to graft chestnut sprouts, as the trees grow much more rapidly and produce paying crops sooner. The method has its drawbacks, too, as considerable cash must be paid out for keeping underbrush down. We know of several large tracts on this plan, but they have all been started within the last six or seven years, and only the oldest of them are bearing anything like a crop. In our opinion it will be several years before the market is well supplied. If they could be grown as easily as Kieffer pears the market would soon be overstocked. Another drawback to chestnut growing is the weevil, and it will be a drawback until some effective method of destroying the insect is found. The grubs in the nuts can be destroyed by fumigating with carbon bisulphide, but as some escape from the nut before it drops there are always enough left for seed. The orchards started on sprout land are generally contiguous to chestnut timber, where the beetles multiply and easily find their way to the grafted trees. We are not prepared to say whether chestnut growing will be a profitable industry for this country or not. It will require some time, we think, to solve that problem.

Pennsylvania. H. M. ENGLE & SON.

THE WOODCHUCK.—I wish to enter a protest against the woodchuck; it is a very destructive pest in this section. There should be a bounty paid or some other means taken to exterminate these animals, as they are of no benefit to the world either dead or alive, and do a great deal of damage to growing crops every year. I would have the much-despised skunk protected by law, as it does a great deal towards keeping in check the white grub (larvæ of the May beetle); also destroys a great number of mice, grasshoppers and other destructive pests. The damage done by his occasional visits to the henroop is nothing compared with the good work he carries on in the field. GEORGE G. WALKER.

Massachusetts.

FAVORS KIEFFER PEAR.—The Kieffer pear is beyond doubt a poor pear to eat from the hand, and especially so unless great care is given to its handling, but nevertheless it is used largely on our market, we believe, with an increasing demand year by year. This year the crop is of better quality than usual, and we think they are at this time drawing better prices than any previous year since there has been any considerable quantity on the market. We recognize it as a coarse, common pear, but commercial orchards are very productive. The fruit being hardy will transport to any part of the country, or can be kept well into the Winter, and for those reasons it has been and, we believe, will continue to be a good money maker, even when sold at very moderate prices. I have great faith in it for the above reasons, and so have an orchard of 1,100 trees.

Philadelphia. J. D. HENDRICKSON.

A PIONEER OF THE BACKWOODS.

How the Forest was Trained to Fertility.

With the great flow of Irish emigration to this country about the middle of the last century, came Richard Haley, "Unele Dick," as we familiarly eall him. Like many of his eountrymen, he sought work in the tanning industry, whieh was then being developed in the hemlock forests of Sullivan County, in New York State. But his love of independenee and of nature soon indueed Uncle Diek to turn to the soil for a means of livelihood. He bought 50 aeres of land, and set himself to the task of making a farm and a home. What remains of his first home in Ameriea after weathering the storms of more than 50 years, is shown in Fig. 378, taken from a reeent photograph, while at Fig. 377 is a pieture of the old gentleman himself. To make a farm in this wilderness, 40 miles from the nearest railroad, was no easy task. The land had to be eleared of timber by hand, as he had no team, and no money with which to buy one. The timber piled and burned, the stones must be removed, and finally the virgin soil stirred by rude hand implements, and the crop planted and eultivated amid the green stumps and tough rootlets of the reeently felled timber. From this modest beginning Mr. Haley has developed a small farm with suitable improvements and a eomfortable home, which he still lives to enjoy. The efficient partner of his early struggles, Aunt Kitty, went to her eternal home about 20 years ago. May rest and peace abide her gentle patient soul! Four children and numerous grandehildren live to comfort his declining years. Unele Diek has been a man of keen observation and great imaginative powers. He knew nothing of books, but he learned philosophy from nature. True, his logie is sometimes faulty, and his conclusions often misleading, but there is an attraetive originality about his reasoning, and his descriptions are always vivid and at times decidedly romantic. As a boy, he terrorized me with aecounts of spooks that pursued him on the road, and of fairies that led him astray through a wood and meadow; but he found soothing drops for my toothache,helped me mount the load for a ride, and gave partial evidence, when the paternal judgment was about to descend on my youthful pranks. His feminine gentleness won my affeetions when a lad, and his simple life, fearless eourage, and sterling honesty eommanded my admiration and respect in maturer years. To the modern readers there is little in the subject of this sketch to suggest an idea of hospitality. Yet of the complete and costly homes that now dot the country, I doubt if a single one has ever sheltered so many weary travelers as this rude cabin. Immigrants without means eame to this strange country to seek employment. In this humble home, they shared the frugal meal, and found shelter and welcome. It is a tradition of the neighborhood that at one time, the representatives of seven families made this house their home. Yet with all their hardships and privations, these early settlers were not without their ambitions and their sentiments. In the legends of the place, "Diek's log house" is the center of some spiey romanees. It is said that here the blushing widow pursued and won her timid lover, and that here eoy maiden stole from the glare of the tallow dip to the shelter of nearby woods, there to lend a willing ear to the awkward but fervent whisperings of the rugged swain, who had followed her from their native County Cork. J. J. D.

A LANDMARK OF THE LAST CENTURY. Fig. 378.

THE "PROMOTER" AND THE FARMER.

Last week we made some remarks about a company that is trying to sell shares of stock in a mammoth storage concern. Here we have some comments on the scheme from a local farmer who has not been victimized.

Of eourse, a "well-known resident" takes the promoter around, thus getting tips on where to call, but I must give him the credit of being fully able to blow his own horn without even a word from another. Somehow the promises he made of being able to sell a $5 grade of flour for $3 and other things in proportion, and selling apples for $7 per barrel, etc., for the farmers, were so attractive that, coupled with his 12 per eent ineome, they allured or mesmerized the farmers about here and they fell into his trap at once, and without investigation, before their sober second thoughts warned them of the absurdity of his statements. "Down the trusts, farmers, by my ideal trust of your own making." Queer, isn't it, that babies and monopolies are wholly wrong till you have one of your own! The point of view makes a lot of differenee. Among farmers he was a prosperous farmer near Buffalo, and to others he was a millionaire, several times over, desirous of getting stock in this wonderful company, and to do so he would buy up the shares of all dissatisfied parties. Some time in January next a meeting of the shareholders is to be ealled, when ground will be broken for the store (or silo), and one-fourth of the subscriptions must be paid in. Rather a cold time we fancy for a lot of eountry lambs to be rounded up and shorn. In the Winter, when the farmer eannot work, the sharper works the farmer. Less than a year ago our village could have seeured a cash milk-buying creamery at no expense whatever if some of these same farmers would agree to sell their milk; but no, they were afraid of a well-known man and cash payments. Now, a stranger bags all of them on an investment scheme.

OBJECTS TO THE "KID WAGON."

I saw in a recent issue of The R. N.-Y. a short article on centralized schools. The writer did not tell all the grievances, nor could he in one paper. My son is a patron of such a school, and we can speak from experienee which proves a dear lesson. Our little boy is nine years old, and we live 1½ mile from the school, but he is obliged to get up before daylight to be ready for the old rickety "kid wagon," for the driver will not wait a minute. Then he is drawn around the country five miles to get 1½ mile. There are from 18 to 20 in the load, mostly large seholars. Some are making love to one another, some are down on the bottom of the wagon pounding eaeh other, some are singing some vulgar song, some are tired of riding and are trying it on foot with mud up to their knees. This erowd does not arrive home again until long after night. Oh, how ean anyone think this the proper way to send ehildren to school! I will admit the transportation is the worst thing about it, although who is there that would like to have a little one six years old five or eight miles from home sick, with no one to eare for him? This happens in the Winter quite often, but they are obliged to stay at school until the "kid wagon" goes at night. I have said "kid wagon"; they are drawn in open sleds through all the worst weather, with no robes but a horse blanket that has been over the old horses through the day, stiff with dirt and filth. Some wise men say all this decreases our taxes. Please figure it right. The transportation costs nearly as mueh as our good old distriet schools used to, and that is a very small part of the expense, but I for one care nothing for the cost if they would only make the children comfortable. If that man or body of men who made this law eould be placed back in their lives at the age of six, and obliged to attend such a school, it would serve them right. Yes, attend in this way or not at all. There were three frail little children who could not go at all last Winter; they lived five miles from school. MOTHER.

Portage Co., O.

There has not been much rot among potatoes about here. The crop has been good in this county. Some big yields have been reported. I see some report very large tubers. I will send you weight of sweet potatoes that I have this season grown in my garden here in Chemung County, N. Y. One weighed 3 pounds 9 ounces, next largest 2½ pounds. What is the use of going South to grow sweets?

Elmira, N. Y. A. D.

COW CARE AND CATALPAS.

A Tree that Sows Itself.

It is a rare thing that I read a copy of The R. N.-Y. without congratulating myself that it is on my list. Especially do I wish to thank Mr. Van Alstyne for the artiele in the November 23 issue upon dairy eows and their management. We heard and read so much about tying eows to their mangers for six months in the year, and some even wanting to keep them there the year round, that it is a comfort to find one who speaks as one having authority in favor of air, sunlight and exereise for the poor eows. The man who, to save a few pounds of feed, will tie his cows to a manger and squirt tubereulin into them to see how fast he is killing them may think he is humane, but he isn't.

Mr. Van Deman failed to answer E. A. G., Norfolk, Mass., in the same issue, as fully as he might in regard to the Catalpa tree. What he said was all right. It grows large and grows quickly, but once grown it becomes a nuisance. A good-sized tree will grow thousands of seeds that the wind will distribute, and every one will sprout, and instead of dying out as young maples and seedlings of other desirable trees will in 99 cases in a 100, the young Catalpa sends down a tap root so deep that one trying to pull it at the end of the first season would think a Chinaman had hold of the other end, while in good soil a single stalk will grow up nearly as large as a bean pole. The leaves are pretty enough, but the odor is decidedly disagreeable. A neighbor living a quarter of a mile west of me had a Catalpa tree, and if anyone wants a thousand young Catalpas I'll donate the trees and contribute liberally toward digging them up. The old tree, I am thankful to say, is done for, and before the young ones get to bearing seed I hope to get them out of the neighborhood.

Connecticut. R. S. HINMAN.

CENTRAL N. Y. MILK FARMING.

I am much pleased that the dairy department of The R. N.-Y. makes the production of milk for the New York market a prominent feature. This is the principal business in our locality. We are in the southern part of Madison County,on the Chenango braneh of the West Shore Railroad, and on this road there is a shipping station every five or six miles, owned by those who buy the milk. At present we are getting 2¾ cents per quart delivered onee a day, getting our pay the 15th of eaeh month for the milk delivered the month before. On our street, in a distance of a mile, there are 185 eows and nine silos. Almost the entire income is from the milk, about as mueh being produced in the Winter as Summer. No one raises as mueh grain as fed, and the feed dealers are making a good thing, the grain bought being gluten feed, bran and eotton-seed prineipally. Many of the dairymen have water in the barn, and all the modern conveniences. The cows are nearly all grade Holsteins, about every farmer owning a purebred bull. The cows are all reared at home on the farm. and there are a number of earloads shipped from here every year to buyers living near New York.

There is complaint from some of the dairymen about the feed bills being so near the size of the milk eheek, but there are many who are making money, and, so far as I can judge, the heaviest feeders are those that are making the most. There was paid through a local bank last year $200,000 for feed, and there were two other banks within five miles that perhaps did as much. It seems as though there ought to be some way to stop this, but no matter how much hay and silage we feed, we cannot get the milk without the grain, and if we try to raise all we feed we must keep fewer cows. One benefit that we ean see is the better erops we are raising each year where attention is paid to the saving of all the manure. While there are some drawbacks to the business, one is sure of a steady ineome during the whole year, and also of steady employment. The question as to whether the quality of milk can be ehanged by feed eomes up every year, the experiment stations not having settled it in the minds of all. Those who buy the milk say many of the dairies test lower this year than last, and as a general thing the corn for the silos did not have one-quarter as many ears on as last year. Does Mr. Cook think that the differenee in quality could be aeeounted for by this?

Madison Co., N. Y. D. B. UTTER.

FARMERS' CLUB

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Automobiles for Farm Work.

Mrs. T. H. Hoskins, Vermont.—I hail with joy the prospect of this sure to come, blessing on the farm, the automobile. When it reaches here with its adaptability to do all kinds of work the church bells shall be rung in its honor. A real Fourth of July celebration should be held in the vicinity. I could have saved $200 or $300 this year if I had owned or hired such a machine. With such a machine a woman with a large orchard to oversee can do most of her work, especially if some frame can be devised to load and unload barrels and boxes. I gathered this year nearly 300 bushels of apples and had only a wheelbarrow to bring them in, except when a neighbor gave an occasional lift. It is next to impossible to get help here this year, and poor and high-priced then. I did more work than two hands I hired to help me, in one day, and my apples were sorted and theirs not as a rule. Are there automobiles for farms made yet in America?

We have corresponded with makers of automobiles, and all but one say that their vehicles are made for road work alone. They are very expensive thus far, and run well only on hard, smooth roads. As there has been little if any demand for farm work yet, manufacturers have hardly thought of a machine strong enough to do all the work required. One manufacturer when asked whether his autos had been used for turning farm machinery said:

We have heard of a few cases where automobiles are put to such usage. They are not built for this usage and would not advise the use of an automobile for other work than that for which it is constructed. It would be much more economical to buy a small engine for such work as you desire, than to use a high-priced automobile, as there is undoubtedly more or less injury to the machine from this kind of work.

Another replies as follows:

The attempt to make use of the automobile, independent of the road service, for which it is built, we think entirely wrong. It does injury to the venicle, and it is shortly unfit for either service. Our steam automobile is constructed to take city and country roads, and hills, and with the ordinary road conditions to make 12 or 18 miles an hour. Our engines are about 5½ horsepower with the boiler sufficient capacity to supply steam. Fittings and all connections are constructed of best material that we can make, and attached and fastened securely to do this work. Suppose you run this wagon back to the mill grinder, or saw, raise the hind wheels, and attach belt from this power to do the other work, the tendency of course will be and perhaps must be to run the engine right up to its limit with perhaps 500 or 600 revolutions, in order to get sufficient steam and power at the other machine. The natural result then is to rack the entire construction in the carriage, disturbing and loosening all connections, and in fact, very soon put it entirely out of commission. It has been done to be sure (not to our personal knowledge) but it is entirely wrong. You are using possibly a $1,000 investment in a splendid wagon to do ordinary farm work, when nothing is required but a simple engine and boiler. We could fit a party up to saw his wood, or grind his feed, and do such other work as you suggest with our machinery in splendid shape at a quarter of the cost of attempting to get this work out of a carriage.

The time may possibly come when a very strong machine, capable of doing all kinds of farm work, will be put on the market at a reasonable price. Most of the machines made at present are apparently fitted only for road work.

Alfalfa Hay for Horses.

B. T. C., Kansas City, Mo.—Is Alfalfa a good hay for hard-worked horses? How does it compare with an equal weight of prairie hay? What is a balaneed ration, including Alfalfa hay, for heavy work horses? What especial danger is there, if any, connected with the feeding of Alfalfa hay to heavy work horses?

The first cutting of Alfalfa cut late, just as it is going off bloom, makes the best of feed for hard-worked (not driving) horses. It is worth, according to reliable tests, a trifle over three times as much as an equal weight of prairie hay. This is not generally known, but it is a fact. I kept over 60 horses one season hard at work from July to October on Alfalfa hay without any grain. I do not know just what is a balanced ration for a work horse when he is under constant strain. When not worked much horses will get hog fat on plain Alfalfa. I feed when my horses are working constantly on the plow and other heavy farm work about three quarts of corn a day and what Alfalfa hay they will eat. If you had asked me for the proper ration for a cow I would have replied 7½ pounds corn and 19½ pounds Alfalfa hay for a 1,000-pound cow, but I have not yet looked into the science of horse feeding. H. D. W.

Kearney, Neb.

Good Alfalfa hay is the very best of feed for hard-worked horses. Prairie hay has no more virtue than wheat straw that is usually allowed to go to waste, and is simply a filling, or roughness to assist in digesting corn. Sheep will starve on prairie hay. As for a comparison of 100 pounds Alfalfa to 100 pounds prairie, it is worth double the prairie hay. Many farmers work horses on Alfalfa without any grain at all. A balanced ration with Alfalfa is the usual amount of corn (two quarts or oats) with salt. When Alfalfa is cut green enough to be at its best, care should be used in getting the horses used to it, and always plenty of salt handy. I don't think Alfalfa, when cut at the right time, is so likely to give horses the heaves as the other clovers. The heaves is a rare complaint in the West.

Moran, Kan. J. C. N.

Fruits for Central New York.

W. F. H., Sherburne, N. Y.—1. Where only a few plums are to be planted, would you recommend the Japans in preference to the European or Domestica varieties for central New York? What can you say of the German prune for general planting in this section as compared with the Japan and other sorts? I have an exceedingly strong recommendation in favor of this variety from a grower at Hoosick Falls, who says he prefers it to all other plums and is the only fruit tree that gives him no trouble. Would it be likely to be fertile if planted alone? 2. Will you name a few of the most desirable apples for this section, both for home use and for market? Whether they are old varieties or new it makes no difference. I find in general opinion Spy takes the preference, with Rhode Island Greening and King closely following. For very early use Yellow Transparent is becoming a great favorite. McIntosh is highly recommended by some.

ANS.—1. As central New York is a region where the European plums succeed quite well it would seem to me to be unwise to lay them aside entirely and plant the Japan kinds instead. The varieties of the European type are the better of the two in quality except in a few cases, and when only a few plum trees are to be planted quality ought to be a prime factor. Such varieties as Princess Imperial (the old Green Gage), McLaughlin and Washington, ought to be grown wherever they will succeed. It is necessary to jar them to prevent the trees being ravaged by the curculio in most sections east of the Rocky Mountains. The name German prune is a class name rather than that of a variety; because there are a number of varieties going under this title. Fellenberg is one of the best of these and is one of the surest to bear. It is self-fertile, so far as I have seen. The Japan plums are well worthy of culture. Red June is one of the very early kinds, but it is not so good in quality as some of the others that ripen later, such as Abundance, Burbank and Wickson. Climax is a very new variety of fine quality. 2. As to apples, it is probable that only Winter varieties are wanted. Northern Spy is one of the best in quality and bears well when it gets started, but it requires some patience to wait until that time comes. Rhode Island Greening is excellent, and finds ready sale because it has an established reputation on the market. For home use it is equally good. Tompkins King is a good apple, being large, bright red and rich in quality, but the tree is very badly affected by disease in most sections and the fruit falls off easily. Sutton is one of the coming apples, and is likely to supplant Baldwin, being of about the same size and color but better in quality. The tree is hardy and productive. Boiken is another of the newer kinds that is finding favor among those who are growing it. The tree is remarkably desirable because of its hardiness, healthy foliage and reliable bearing qualities. The fruit is of fair size, yellow with a brilliant blush and of good quality. It also keeps well. Grimes is gradually making its way into public favor because of its many sterling qualities. I do not know of a bad trait about it, either in tree or fruit, only that it is not a late keeper south of New York and Michigan, where it will keep under ordinary conditions well on towards the end of Winter. It is of the very first quality in flavor and will always demand a fancy price in market for this one reason. Besides, it is one of the most beautiful yellow apples to be found. I saw it recently in Central Market in Washington, D. C., selling at $2.50 per 50-pound box. Jonathan is a match for Grimes in almost every respect, except that it is brilliant red and more tart in flavor. It brings a high price in market. It does not grow quite large enough in New York to suit some buyers, but its color and quality are excellent. McIntosh is good in color and quality, being brilliant red, very tender in flesh and of pleasant flavor. It is a seedling of Fameuse, is larger, is not so subject to scab and in my opinion so far surpasses that old standard as to make its culture practically needless. It has all its good qualities and more besides. In regard to Summer apples, the Yellow Transparent is a very precocious bearer, but it is not of high quality and will not bear distant shipment well, because of its very delicate flesh and light color; the latter showing bruises very plainly. It is good to use as a filler between permanent apple trees, but only a limited quantity should be grown. Oldenburg is later, but it is a good market apple and will always sell fairly well. Its quality is poor, but the bright red stripes, ability to endure rough handling and the ruggedness and productiveness of the tree will always give it a prominent place as a market apple. It makes an excellent filler between other trees. H. E. V. D.

The discomforts of Influenza, the danger from Grip, and kindred disorders, can be modified and cured—perhaps altogether prevented—by a prompt resort to Dr. D. Jayne's Expectorant.—*Adv.*

EVERYBODY'S GARDEN.

HORSERADISH.—With favorable soil and accessible markets there is no question as to the profits in growing horseradish. The Fall being the most favorable time to secure the roots for next season's planting, it is now a timely subject to discuss. It is well, however, before undertaking the work, carefully to consider the above points, as, lacking either favorable soil conditions or accessible markets, the results will prove disappointing. The principal markets are, of course, the cities or large pickling factories, but thousands of bushels are annually shipped for long distances, and there is no valid reason why it may not be grown in any locality where potatoes are grown. Growing on a large scale would be somewhat expensive for the first year, as the roots or settings would require quite an outlay. After that, however, no outlay is necessary, as the small ends of the roots and the lateral shoots will keep up the root supply for the next season's crop. It is well to bear in mind that no time need be wasted upon the ordinary wild product growing in the fence corners or gardens, as it will not produce a salable article, and once started, is almost impossible to get rid of. The cultivated roots or sets can be obtained from most of the seedsmen, but consult only those of known reliability, as worthless stock would mean heavy losses. The ideal soil is a deep clay loam, and very rich, other soils, provided they are deep enough, may be sufficiently enriched to grow a good crop. Do not attempt to grow it on a poor thin soil, as the ground must be rich enough to produce a large root growth in one season. The cultivation is very simple, but requires the ground to be plowed very deeply and thoroughly fitted. When ready for setting, which ordinarily should be early in May, the ground is marked off in rows three feet apart, the roots to be set two feet apart in the rows. The holes are made with a long dibber or crowbar eight or ten inches in depth, but always sufficiently deep to admit the entire root. A set is dropped in each hole and the soil pressed around it. The shoots will soon appear above ground, and after that all the care necessary is to keep the ground free from weeds. As the principal root growth is made late in the season, many growers plant the horseradish between rows of early peas, beans or sweet corn, thus securing two crops in the one season. Other growers sort the sets, planting the larger ones by themselves to secure an early crop. From $2 to $3 per bushel is often obtained for large roots during the pickling season. The main crop should be left in the ground as late as possible, but should be lifted before heavy or continued freezing sets in. The roots may be stored in pits or in sand in a root cellar, so that they are available at any time. A conservative estimate as to yield would be 80 bushels or upward per acre, and as good stock seldom commands less than $1.25 per bushel in this market at least, it will be seen that the profits are good. These suggestions are thrown out as a basis for a profitable side line for many farmers and gardeners whose surroundings are favorable for the work.

BILLION DOLLAR GRASS.—I tried it last Spring, but somehow the grass failed to materialize owing, I think, to defective seed. I needed it for soiling purposes, and the seed was put in under ideal conditions. The weather was as if made to order, and I reasonably hoped for satisfactory returns; but I waited patiently until the "pusley" and round-top was a foot high and too thick for a mouse to crawl through. The growth of weeds was plowed under, but fearing the excessive heat would cause too much fermentation I topdressed with lime at the rate of 3,000 pounds to the acre. I decided to plant out late celery, but being disappointed in the plants, I next turned to late cabbage. It was July 18 before I had the ground fitted as I desired, and the weather was very hot and dry. The neighbors said it would be useless to set out the plants until it rained, and the ground did look like an ash heap on the surface, but I knew that beauty was only skin deep, for below it was moist. I planted out the cabbage in the evening and my wife followed with the shears, clipping off all the leaves, leaving only the head formations. Next morning they were watered and left to their fate, but less than two per cent of them died. Now it was later than I would advise setting cabbage ordinarily, but rich ground and thorough culture both before and after setting brought the crop along nicely although the rain held off for days. In August one-half of the ground was entirely covered with manure, and the results in yield were greatly in favor of the mulching theory. The Cabbage worms were very destructive at one time, but an application of fine salt and wood ashes in the proportion of one to three in the order named, settled the matter once for all. All in all, this is the most effectual remedy I have ever used. The late Fall was favorable and a fair crop was secured, but generally speaking, such late planting is not safe. Although the grass was a failure, it was by no means a hopeless discouragement, but next year, with better seed, I hope for better results.

RHUBARB ROOTS.—As predicted by the writer several years ago, rhubarb roots for forcing would, at no distant day, be in demand, and the growing of roots to meet that demand would assume no mean proportions. As proof of this, orders come to this section every few days from nearly all parts of the country only to be refused as the home demand is far ahead of the supply. The grower who is so fortunate as to have the roots would find ready market for them provided he cared to sell, but he, wisely, prefers to force them. A nearby gardener, going out of business, recently sold at auction 21,000 roots at prices ranging from $7.75 to $9 per 100, as they stood in the ground. This number of roots can easily be grown on one acre, so it will be readily seen that the crop is highly profitable, even if no use were made of the Spring crops of leaf stalks. We are not advising a wholesale rush into this new enterprise, but nevertheless it seems reasonably certain that the demand will come, and for those favorably situated, the way is open into a profitable field of labor. J. E. MORSE.

Michigan.

GRAIN-O! GRAIN-O!

Remember that name when you want a delicious, appetizing, nourishing food drink to take the place of coffee. Sold by all grocers and liked by all who have used it. Grain-O is made of pure grain, it aids digestion and strengthens the nerves. It is not a stimulant but a health builder and the children as well as the adults can drink it with great benefit. Costs about ¼ as much as coffee. 15c. and 25c. per package. Ask your grocer for Grain-O

WE LEAVE IT TO THE READER TO SAY

"WHO JUGGLES,"

AND

Who "Bobs Up With One Lie After Another."

It is characteristic with that class of people to lose their tempers and call names because they have no good arguments and must depend on **bluffing.**

Our "would-be competitors" are squirming terribly because the United States beat the DeLaval in the Model Dairy at the Pan-American, and are resorting to all sorts of **schemes** to break the force of the victory of the United States over the DeLaval Separator.

They say we put out "what purports to be a skimmilk record of the work done by the 'U. S.' machines in the Model Dairy." We gave the exact statement signed by the Superintendent of the Model Dairy, namely: Average test of the U. S.--**.0138.**

They published a statement also signed by the Superintendent of the Model Dairy showing average of .0161. The Superintendent afterwards found he had made an error, and stated over his own signature the correct average for the DeLaval was .0172; but these "would-be competitors" do not correct the error, but continue to advertise the figures which they know to be wrong.

The DeLaval Co. published their second period of running, which was in the best season of the year, from August 9th to September 28th inclusive. We published our second period from September 29th to October 30th inclusive. All experienced dairymen know that the U. S. had the hardest milk to separate, as the cows were longer in milk, giving less quantity, and cold weather coming on; yet, with all these conditions against the U. S., it excelled the DeLaval, as the Superintendent's reports show. (It also beat the DeLaval in the first period, after adjustment.)

The DeLaval statement reads "Tests were from August 9th to September 28th," but the record books of the Model Dairy show no record was made until the 11th of August. This gives them two days to adjust the machine under the friendly expert operators before any tests were recorded.

Our statement includes the first run of our machine with no time allowed for adjustment.

The records after adjustment of the first period show that the United States beat the DeLaval on these runs also.

The DeLaval Co., being aware they were beaten in the first period, sent their machine back to the factory to be fixed over and improved, if possible, for a second trial. Their machine was one made special for that work. The U. S. was taken from regular stock and was returned to its booth after the first run and remained there until we were requested by telegraph from the Superintendent of the Model Dairy to put in the U. S. to make a second run. We wondered why the necessity for telegraphing such a request, but telegraphed back we would comply with the request. We learned later that the DeLaval was shaking so badly that it was not deemed safe to run it longer, therefore the necessity for arranging by telegraph to replace it with the U. S.

The DeLaval Separator is a top-heavy machine filled with 40 to 50 metal discs, and when they get out of balance, cause trouble if continued in use. Therefore the necessity for immediate change when it begins to shake. They claim to run on slow speed, but always, when in competition with the U. S., attempt to run at very high speed—sometimes more than 50 per cent higher than they advertise to run. They know that their separator cannot run at high speed long, so run it at high speed only in tests with the U. S.

The U. S. is made more substantially, and does stand high speed, and runs longer and easier at its speed than the DeLaval does at its claimed lower speed.

The DeLaval Co. advertise a "voluntary" (?) statement purporting to be from the engineer of the Model Dairy in which he says "it took but one-fourth as much steam to do our work with it (DeLaval) as the 'United States' used." Such a statement is so ridiculous on its face that no experienced dairymen would doubt that it was *voluntary* on the part of the DeLaval Co.

We have hundreds of statements from dairymen, who have used both separators, that the U. S. runs easier than the DeLaval, and wears much better.

The truth is that Engineer Downy was never present when the U. S. was running, with one or two exceptions, when his Department was unable to get sufficient steam to run so much as a Babcock Tester until very late in the forenoon. The work in the Model Dairy was done before he got around in the morning.

Now read what Mr. Van Alstyne, Superintendent of the Model Dairy, over his own signature, says in reference to power in September when the DeLaval was running:

> "We found the power insufficient, and were obliged to put a cut-off in the pipe leading upstairs to prevent the herdsmen drawing on our steam at times when we needed it for the dairy work, and as the weather became colder the latter part of September, this trouble increased to such an extent that one day, with both burners lighted, we found our steam entirely out, so that *we intended making a change before your machine was put in*, and we were delayed a week in order to get the consent of the proper authorities. We then used soft coal, which did not give satisfaction, because it filled up the flues of the boiler, and we changed to coke, which has been eminently satisfactory."

Remember this was when the DeLaval Separator was running and before the U. S. was put in. They could not get steam enough to run the DeLaval.

This "voluntary" (?) statement says further "that the 'U. S.' had an expert to run it." He was in no sense an expert, had never worked in a creamery or dairy or attended a Dairy School or Experiment Station. The DeLaval did have experts to run theirs. Both operators were graduates and rank partisans of the DeLaval, and were angry because we objected to having unfair and prejudiced operators run the U. S.

The DeLaval Co. advertise that our Gold Medal was awarded on "combined exhibit of separators, Babcock Testers, Davis Swing Churns, and other apparatus." The official record reads: "Gold Medal on U. S. Separator, Babcock Tester, Davis Swing Churn." It does not read on "combined exhibit" and does not use the word "exhibit" in any way. The reader will notice the DeLaval Co. add the words "combined exhibit" and "and other apparatus," of course, to mislead in their endeavor to break the force of their defeat.

We had in our booth nine separators, two Babcock testers, and a model of the Davis Swing Churn, but no full-sized churn. Our booth was 15 feet long by 10 feet deep.

We applied for larger space, but were informed that the building was limited in size and we must be content with what was assigned us. We had the smallest space of any exhibitor of separators. The DeLaval Co.'s booth was 35 feet long by 10 feet deep, and contained sixteen separators; therefore, if our Gold Medal was on the exhibit, it is equally true the DeLaval's was on their exhibit, and as our exhibit was less than half as large as theirs, will the intelligent reader believe the DeLaval statements that with less than half the space and about half the amount of goods, our award was on display?

The work in the Model Dairy was not finished until long after the Gold Medals were awarded by the judges. If the awards had been given on the result of the work in the Model Dairy, the United States would have had the *only Gold Medal*, and the DeLaval an award of second merit only, a Silver Medal, as it came out second on the work there.

The DeLaval Co. advertise "that more fat was lost in churning (by the U. S.) than saved in separating." The records show that

Average test of the buttermilk from the United States was - - .109

Average test of the buttermilk from the DeLaval was - - - - - .121

The DeLaval was badly beaten again in this line. The U. S. proved to be superior in every way.

The reader must not forget that the DeLaval Co. have been advertising for over a year that the DeLaval Separator was awarded a Grand Prize at Paris, but now admit in their advertisements that this award was to the "Société Anonyme Separator," which company exhibited at Paris a butter extractor called a radiator, and did not exhibit a cream separator.

For Proof of our Statements we Refer to the Official Records.

VERMONT FARM MACHINE CO., Bellows Falls, Vt.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

AN INTERESTING CATALOGUE.—The Fall catalogue of the Eastern Shore Nurseries, Denton, Md., is of unusual interest to plum growers and lovers of stone fruits. J. W. Kerr, the proprietor, has long been known as an enthusiastic "plum crank," and he has here systematized his vast information and experience in a valuable way. The varieties offered are grouped together according to their botanical affiliations, and the descriptions are very concise and guarded. The Wild Goose group is regarded as preëminent for commercial planting among native plums, and the Wayland varieties for domestic and culinary uses, though the Americanas are conceded to have the best flavor. The list of recommended Japans is brought down to three, Abundance, Berckmans and Chabot, though more are offered for trial. Where a high degree of atmospheric moisture usually prevails during the ripening season, the brown rot is so destructive as to preclude all hopes of profit. Burbank is worthless on that account on the Chesapeake and Delaware Peninsula, though often satisfactory at the North, and the same may be said of Satsuma, Hale and many others. All the Japans rot some, but all the fruit on a given tree of the three recommended varieties does not rot as a usual thing, and fair crops often result. As may be expected the hybrid plums, of which there is now a rather formidable list, are given much prominence. The acme of plum excellence, both from a commercial and amateur standpoint, is here presented. Gonzales, a large, red and very productive variety from Texas, is regarded as most valuable for market. It originated in the Texas town of that name, but the parentage is not given. A new Chabot-Wayland hybrid, originating with Mr. Kerr, is offered with much confidence. It is named Waugh, after the talented author of "Plums and Plum Culture," and is described as a large, dark purple in color, with rich, high-flavored yellow flesh. It colors up 10 days before it ripens, and is profusely borne on a vigorous upright tree with tough, resistant foliage. Mr. Kerr is hopeful of the future of the Beach plum, Prunus maritima, and has hybrids between it and many Japan and native varieties as well as cherries and peaches. As his Beach plum trees are completely self-sterile, there is no uncertainty about the work of cross-breeding, and the results already attained are gratifying, but the new combinations are not yet ready for dissemination. In addition several interesting hybrids between plums, cherries and the Sand cherry, Prunus Besseyi, are offered, as well as some pedigree hybrid peaches of much promise. Incidentally there is a good assortment of standard and new fruit trees and plants. The work of such horticultural "cranks" as Mr. Kerr is certain to be of great and permanent value, and they should be heartily encouraged.

A HANDSOME NEW SHRUB.—Seeds of Buddleia variabilis, a beautiful flowering shrub newly introduced from China, were offered probably for the first time in America, in the Spring catalogue of Henry A. Dreer, Inc., Philadelphia, Pa., with the statement that they might be expected to produce flowering plants in four months. A packet was procured for trial, and germinated well, but the plants did not bloom until October, six months after sowing, though more stimulating treatment of the seedlings might have shortened the period. Fig. 375, first page, shows a bloom spike somewhat reduced in size. The blossoms are rosy lilac with an orange-yellow "eye," and are quite fragrant. They are produced with great freedom at the termination of the numerous slender arching branches. Our plants grew about 18 inches high, and were covered with bloom when the first November freeze checked further development. The foliage is bright green above and velvety white below, clothing the plant in an attractive manner. This species of Buddleia grows from three to eight feet high, but is variable both in habit and bloom, a peculiarity which is indicated by its name. Although called hardy, and able to withstand much frost, it has been killed to the ground in the latitude of Boston, but freely pushes young shoots again, which mostly flower the same season. Buddleia is quite an extensive genus, comprising about 70 species growing in warm and temperate regions of America, Asia and South Africa. Only four or five species are cultivated for ornament, and of these B. variabilis seems freest in bloom. B. Japonica has lilac blooms, B. Lindleyana is purple violet in color, and comes from China, while the former is a native of Japan. B. intermedia is a garden hybrid between the above, and has quite an erect habit, and produces many long racemes of violet flowers. Other species with yellow or purplish crimson flowers are very handsome, but only adapted t places free from sharp frosts. B. Colvillei, with flowers almost crimson, is thought to be the best, but is tender, and only strong old plants bloom freely.

UNSEASONABLE FRUIT BLOSSOMS.—For many weeks the local papers have contained accounts of the belated blooming of fruit trees, chiefly apple and pear, though instances of similar behavior of cherry and plum were reported. So numerous and conspicuous were these unusual Autumn blooms that much comment has been excited, but a consideration of the abnormal character of the growing season, with the early destruction of foliage from excessive rain and accompanying fungus troubles, and the prolonged hot weather in the early Fall, it is not really surprising that occasional branches, or in some cases whole trees, should be stimulated into an untimely growth. The result can only be a weakening of the parts concerned to a certain degree, though a good growing season will doubtless restore the wasted vitality. On the Rural Grounds several currant bushes that had dropped their leaves in August bloomed profusely in October, and set fruits, while a Simoni plum developed two plums to nearly half size before freezing stopped their growth. A number of ornamental shrubs, such as Japan quinces and Spiræas, produced a scattering bloom, and one lilac pushed a flower truss almost to the point of opening the buds.

W. V. F.

Opinions of Apples.

On page 788 I notice that Mr. Van Deman has something to say about the Ontario, Salome and Scott apples. His remarks suggest to me that the quality and commercial value of a variety may largely be a matter of personal opinion. For instance, he says that Ontario is not as good as Spy, nor is it as late a keeper. If this statement refers solely to the fruit, I might be inclined to agree; but if it refers in general terms to the value of the two varieties, tree as well as fruit being considered, I cannot concur. The Ontario bears much younger and is generally more productive than the Spy. I am not sure that it is inferior in quality, and I am fairly certain that the tree is hardier. I do not quite think that Salome had full justice done it in the statement that it is "neither large nor high in quality." It is of medium size, large enough—as large as Jonathan. The tree is productive, the fruit is handsome, smooth, a long keeper, and of very fair quality, and the tree is fairly hardy. Again, Scott (commonly known as Scott's Winter) should have its full measure of usefulness outlined. This for certain parts of Vermont, northern New York and Canada, I believe is an exceedingly valuable sort. It is a regular annual bearer. The tree is very hardy and the fruit keeps through Winter without any difficulty. As a late cooking apple, it is unexceled by any I know. The principal fault of the variety is its small size, and in the early season its sharp acidity. But in late Winter, when apples are scarce, it is certain to be appreciated. These points are not made in a spirit of criticism, but merely to suggest that it is difficult in a few words to do justice to the merits of varieties of apples. JOHN CRAIG.

AN UNUSUAL PEAR.—From Ellwanger & Barry, of Rochester, N. Y., I secured a pear tree, no name, but numbered 1,405. This year the tree fruited for the first time, and had about 125 pears. The pears had the shape of a well formed Bartlett, about the same size, short stem, hanging well to the tree, and ripening the middle of September; color, intense yellow with a dark red blush nearly covering five-eighths of the fruit. Flesh, juicy, mellow and rich, vinous. Tree, an upright grower, resembling Seckel, and thus far free of blight. F. J.

Hollidaysburg, Pa.

R. N.-Y.—Ellwanger & Barry write us as follows. "We have referred to the order in question, and find that the buyer had a number of varieties of pears from us in 1887, among which was a Chinese pear, called De la Chine 1,405. We have not cultivated this variety for some years. We had at that time several varieties of Chinese pears under numbers, but they are not now propagated."

Can You

do a little pleasant and profitable work for us in your own town? No experience necessary. We will explain just what you have to do. The work will be light, and we will arrange for the time you shall be able to give to it. We can give you work for all your time or just for your spare time. Write for full particulars. THE RURAL NEW-YORKER, NEW YORK

If You Are Sick

Let Me Know It.

I wish simply your name and address—no money. Tell me which of these six books you want.

I will send with it an order on your druggist to let you have six bottles Dr. Shoop's Restorative. He will let you take it for a month; then if it succeeds, he will charge you $5.50 for it. If it fails, he will send the bill to me. He will trust to your honesty, leaving the decision to you.

Such an offer as this could not be made on any other remedy. It would bankrupt the physician who tried it. But in five years I have supplied my Restorative on these terms to 550,000 people. My records show that 39 out of each 40 paid for it, because they were cured.

This remedy alone strengthens those inside nerves that operate all vital organs. It brings back the only power that can make each organ do its duty. No matter how difficult the case, it will permanently cure, unless some organic trouble like cancer makes a cure impossible.

I have spent my lifetime in preparing this remedy. I offer now to pay for all you take if it fails. I cannot better show my faith in it. Won't you merely write a postal to learn if I can help you?

Simply state which book you want, and address Dr. Shoop, Box 570, Racine, Wis

Book No. 1 on Dyspepsia,
Book No. 2 on the Heart,
Book No. 3 on the Kidneys,
Book No. 4 for Women,
Book No 5 for men (sealed),
Book No 6 on Rheumatism.

Mild cases, not chronic, are often cured by one or two bottles. At all druggists.

HOPE FARM NOTES

STRAWBERRIES.—Thanksgiving came with a cold snap on her teeth. The mercury went down to 12 degrees at one time, and the ground froze over four inches deep on the lower part of the farm. On the hills there was merely a thin crust. This was much earlier than we looked for severe weather. Our weakest defence against Jack Frost is at the barn, where the water pipe enters from the pump. This was well banked and so nothing suffered but some young roosters that ran out of their coop and would not go back. The firm, solid crust on the ground decided me to mulch the strawberries at once. Usually we do not put the mulch on until just before Christmas, but this year we will try it a month earlier. The plants are so large and fine that we feel like taking every precaution to carry them through the Winter well. We use our coarsest manure for this work. This contains the long cornstalks which have been fed while waiting for the shredder. We put a thick, heavy mat over the rows. . . . The strawberry plants which were set between the cabbage plants in August have made a good growth without sending many runners. They ought to produce a small crop next year. They have been well mulched. We plan to work up the soil between the rows next Spring and sow two rows of onions between each two rows of strawberry plants. . . . After a few days of severe cold the weather moderated, and drove Jack Frost out of the ground except on the north side of the house and under the mulch. That was one reason why I wanted the strawberries covered. It seemed too early for settled cold weather, and every freeze and thaw means bad business for the strawberry roots. I propose to imprison Jack Frost under that mulch from now until next April if I can. He won't teach the roots any bad habits, and if I can't keep him I will make it so hard for him to get away that he won't have any force left to pull the roots out with him. I now believe that the settle and heave of early Winter are as bad as the thaw and freeze of Spring. Therefore mulch at the first hard freeze!

FARM NOTES.—We are also putting a light mulch of coarse manure around all the little trees. Those that were set this Fall come first in this treatment. Unlike the strawberries the little trees are mulched while the frost is out of the ground. We do not want to hold the frost around their roots, but to hold it out as long as we can, so that the little tree may have as long as possible to establish itself. The peach orchard is on light land near the top of a high ridge. With this manure mulch I think the trees will be wriggling their toes long after the soil in the valley has closed round the tree roots like a shoe one size too small! . . . For the first time in the history of Hope Farm we have all the celery we can eat. I feel rather ashamed to say that in former years our celery crop never got into our mouths except in the Spring when we told what great things would be done with it *this year*. This year Philip took it in hand and staid by it through wet and dry. As a result we have a comfortable lot packed away for the Winter. One field at the lower part of the farm seems well suited to such crops as onions and celery, and I feel tempted to let Philip try his hand on a larger scale with these crops next year. . . . The boys have begun work on the new house. What house is that? A little cottage that we expect to build at Hope Farm this Winter. Charlie and Aunt Emma are to occupy it. It is a small house, but will be neat and cosy for a small family. This will give us a good Winter's job. We dig the cellar with our own labor, and haul stones from the old walls for the foundation. The mason does his work on contract. I shall buy the lumber and hire two good carpenters by the day. They with Charlie and Philip will put the house together. Hugh expects to take the short course at Cornell this Winter and learn how to study a tree.

FEED NOTES.—I decided to exchange the rye straw for bran and whole wheat. I think these give us the best bargain at present. The wheat is for chicken feed. The dried brewer's grains have been quite satisfactory for horses, hens and hogs, but the cows do not like them. In fact they refused to eat them unless mixed with bran or cornmeal. They fell off in milk when fed the grains alone, but when bran was added the whole ration was eaten and the milk increased. The brood sows eat the grains well. We use them in preparing a mash for the hens. One trouble with all these by-products is the fact that they are not uniform. I think they vary considerably in analysis. One great advantage in buying whole grains is that you know for sure what you have. I have been asked why we do not have our corn ground cob and all. In spite of what the chemists say I have never considered that the cob contains any great amount of available food. Young and thrifty horses will get about all there is to be heard from in the ear by gnawing it off the cob. Vigorous sows will do the same. I would rather let a sow gnaw the grain and then burn the cob and feed her the ashes than to grind both together into a coarse meal. It might be different with fattening animals, but we plan to sell ours for some one else to fatten.

CRIMSON CLOVER.—The following note from J. H. Hale is worth thinking over:

I have about 100 acres of Crimson clover here in Connecticut that has made a great growth this Fall, and looks fine now; don't care whether it winterkills or not. I want to plow the land early in the Spring, anyway, and if the clover lives through there is an awful temptation to let it grow awhile and pump the moisture out of the soil. In my nursery work I find I can grow more and better small fruit plants or better trees after a heavy crop of cow peas than any other fertilizer I have ever used, and if any of my strawberry propagating beds happen to be left over for fruiting I find the cow-pea fields retain moisture much longer than fields that have not had the peas. This applies particularly to sandy loam soil.

I know how hard it is to plow the little clover under when the plowing ought to be done. It looks so thrifty and green, and grows so fast that it seems a shame to put it under. You pull up a plant and see the nodules on the roots, and get to figuring how many bags of nitrogen it is sucking out of the air—and the result is you let it go too long. From this year's experience I feel sure that it pays to sow rape or Cow-horn turnips with the clover. These crops are still alive with us, and have made a tremendous growth. I expect they will be well rotted by Spring, and that they will protect the clover. Mr. Hale knows far more about cow peas than I do. Much of my first information came from him. My experience goes to show that what he says about cow peas and fertility is sound as a trumpet.

SPRING EXPERIMENTS.—Another Connecticut man who knows his business sends these suggestions:

When you sow oats next Spring try a little patch with the stable manure, harrowed in on top with the oats and grass seed, and when you plant your potatoes try a good handful of fertilizer on top of hill after planting. I got 200 bushels of sale potatoes this year from $25 worth of fertilizer, and think there is enough left in the soil to give me a crop of rye, and this in a locality where the potato crop was so poor that some of my neighbors didn't dig. I have a couple of acres of grass seed sown as advised by Geo. M. Clark. One acre I put on stable manure, and on the other acre $20 worth of commercial fertilizer. As it is all in one piece and about as level a a house floor, I hope to learn something, and if I do will report.

I do not expect to sow any oats next Spring—as I feel quite sure that beardless barley is a better Spring grain for our purpose. I shall try this plan if possible. I cannot understand why such results should follow putting the manure or fertilizer on top of the ground. However, I have come to the point where I don't care for the why if I can get the potatoes. I didn't get them this year, and there is another lost "why," for I can't figure out any exact reason for it. I'll put fertilizer anywhere you say if you will guarantee the crop. As for the two acres of grass, I should say from my own experience that the manured acre will give the best yield the first year, but will gradually fall behind the other in subsequent crops.

A GOOD JOB.—The following letter has nothing particular to do with Hope Farm—yet it is a part of the Hope Farm man's correspondence, and the practical people will no doubt excuse me if I take space for this matter. Mr. Hubbard is a New York State boy who went to Cuba after the war, and started a school and home for Cuban orphans. The Spaniards did strong work in killing off the Cubans, and our own soldiers sent a few Spaniards after them. Mr. Hubbard went to Cuba not to kill but to help live:

I think you can call me a kind of a latter-day Mormon, even though I am not married at all, for I have three homes with about 80 children in all in one city, and now I am thinking of branching out into another city. The City Council of Cardenas, a city of about 22,000, about 30 miles east of Matanzas, has leased to me for the term of three years for the nominal rent of $36 a year the buildings where the Government last year maintained an asylum for over 100 children. The land there is excellent for vegetable gardening, and there is a windmill on the place to supply water for irrigating. With all my other duties I have very little time to look after this work myself, and I want to find a hustling young market gardener or old market gardener to come to help us. If we cannot find anyone to come permanently, a man who could come for only three or four months this Winter could have his living while here and some valuable experience, and could do us lots of good and give us a good start in the business. The second-class fare from New York to Matanzas or Cardenas, Munson Line, is about $20. We could probably arrange to give the man a share of the crops if necessary to pay his way coming and going. Several men and women who like our kind of work for the pay we are getting could find plenty of work with us this Winter or longer. The sooner they can come the better. ELMER E. HUBBARD.

Matanzas, Cuba.

Now there is a good job—perhaps for you!

How much is there in it?

Why, you can pay your own fare both ways, put in a few months hard work for nothing and make the school a cash present when you come away. That's the "going wages" for such a job!

Do you take me for a fool?

No, I take you for a wise man, old enough to know that the stuffing in the most satisfying moral turkey contains little gold dust. I picture you as a man who has made enough to last you in fair comfort through your life. You are wise enough to know that if you go on toiling and slaving and saving the money will not add to your happiness, and may put the stain of laziness or unthrift upon your children. You understand the gardening business. As you dug and pawed in the dirt your ambitions and thoughts have soared away from the soil, and you have longed for a larger and broader field, where you might help make history and leave a thumb mark on the page of progress. If you are that sort of a man—here is your chance.

How do you make that out?

The man who helps show those Cuban boys something of the dignity of labor makes himself a part of the mainspring of civilization. There are some who hustle and slave to wring the last dollar out of human life. They wring so close that manhood and honor follow the dollars. The Spaniards have done this for thousands of Cubans. Americans are now needed to untwist these wrings, shake out the cramped lives and put into their hearts the germ of honest, self-supporting labor. You go down there and help Elmer E. Hubbard in his noble work, and Congress will not vote you even a leather medal. You won't get your name in the paper and have a brand of cigars named after you. That is reserved for those who kill their fellow men—not for those who try to save the pieces of humanity that are left behind. Congress won't pat you on the back, but conscience will tap on your vest.

Why, I have met retired farmers who grieved because they "had nothing to do!" Here's your job! This is a fair honest call. Do I hear anyone say "Here am I?" Come now, we must have American agriculture represented in the uplifting of Cuba! H. W. C.

For the land's sake, use Bowker's Fertilizers. They enrich the earth.—*Adv.*

The Past GUARANTEES The Future

The Fact That

St. Jacobs Oil

Has cured thousands of cases of Rheumatism, Gout, Lumbago, Neuralgia, Sciatica, Sprains, Bruises and other bodily aches and pains is a guarantee that it will cure other cases. It is safe, sure and never failing. Acts like magic.

Conquers Pain

Price, 25c and 50c.

SOLD BY ALL DEALERS IN MEDICINE.

LAND DRAIN TILE

(Car-loads or less).
Sizes, 2, 2½, 3, 4, 5 and 6-inch.
WILLIAM T. LEGGETT & CO.
1025 Liberty Avenue, Pittsburgh, Pa.

BEFORE BUYING A NEW HARNESS write for our 200 Page Illustrated Catalogue giving full description and prices of all kinds of single and double harness and save 25 per cent.
King Harness Co. 510 Church St., Owego, N.Y.

THE CHAIN-HANGING

Cattle Stanchion

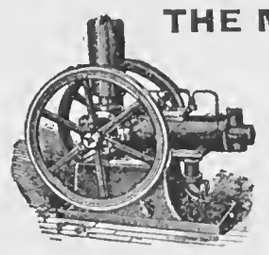
The most practical and humane Fastener ever invented. Gives perfect freedom of the head. Illustrated Circular and Price free on application. Manufactured by O. H. ROBERTSON, Forestville, Conn.

CATTLE STANCHION.
Keep cattle comfortable and clean. Can turn head and lay down naturally. A new thing. Write for the booklet before buying. Full information. It is mailed free.
FRAGNER & COMPANY, Box 18, Monroe, Mich.

The BEST Cattle Fastening.
SMITH'S Self-Adjusting Swing Stanchion. The only *Practical* swing stanchion invented. Thousands in use. Illust'd Circular free.
GLENORA MFG. CO., Glenora, Yates County, N. Y. Infringements will be prosecuted.

CONSTANT FLOW OF WATER
to the house, the barn, the garden or lawn is assured by the
RIFE HYDRAULIC ENGINE.

Pumps water automatically. Better than any ram, engine or windmill. Sold on 30 days trial. Fully guaranteed. Catalogue Free.
RIFE ENGINE CO., 122 Liberty St., New York.



THE MIETZ & WEISS
Kerosene Engines
Cheapest and Safest Power Known. For pumping and electric lighting, grinding corn, separating cream, sawing wood, *and all power purposes. Awarded Gold Medal* Pan-American Exp., Buffalo, 1901. Send for Cat.
A. MIETZ,
128 Mott Street, New York.

CHARTER Gasoline Engine
USED Any Place By Any One For Any Purpose
Stationaries, Portables, Engines and Pumps, Hoisters
Send for Illustrated Catalogue and Testimonials. State your Power Needs.
Charter Gas Engine Co., Box 26, Sterling, Ill.

Easy Harness

All harness, old or new, is made pliable and easy—will look better and wear longer—by the use of

Eureka Harness Oil

The finest preservative for leather ever discovered. Saves many times its cost by improved appearances and in the cost of repairs. Sold everywhere in cans—all sizes.
Made by STANDARD OIL CO.

SUBSCRIPTION: ONE DOLLAR A YEAR.

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs.

"A SQUARE DEAL."

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

Name and address of sender, and what the remittance is for, should appear in every letter.
Remittances may be made in money order, express order, personal check or bank draft.
THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, DECEMBER 14, 1901.

IN theory the plan of a centralized school is about perfect. In practice there are several sides to it. For instance, before we would let a little child make daily trips in such a "kid wagon" as is described on page 835, we would surely keep him at home!

*

WE advise farmers to attend every institute they possibly can this year. Make these meetings as large as possible. There is every reason for it. Even if you think you cannot learn a thing from the speakers you can add one to the crowd, and help give importance to the meeting. It pays to have every meeting that is called in the interest of agriculture well attended. That gives power and dignity to the business, for whenever people see a room full of farmers they realize that a strong and steady force has started, and that it will pay them to notice it. By all means go to the institute and help show that farmers are taking more interest in their business.

*

As stated last week, the New York Milk Exchange raised the price of milk twice in one week. There was no benevolence about this—or about anything else the Exchange may do. They were forced to increase the price in order to obtain milk. Owing to the high cost of grain many farmers were unable to make milk at a profit. They sold cows or quit feeding grain, and this created a shortage. The Milk Exchange hopes by increasing the price to induce farmers to feed more grain or buy cows. This will increase the milk supply, and when it reaches a certain point they can cut the price again! The facts are that the Exchange can well afford to pay more than it is now doing. The margin between its price and the price paid by the consumer is too wide, and the dealers are still making an unfair profit. The expenses of the handler have not increased, for the increased price which he pays for milk is more than offset by the increase of his price to the consumer. On the other hand, the expenses of the farmer have increased out of all proportion to the increase in his price.

*

THE results of the recent boom in improved chestnuts seem slow in materializing. The markets are not yet flooded with the big, handsome nuts we were led to expect, but the opinions of experts given on page 834 show that the outlook is still hopeful. Chestnuts are more difficult and expensive to propagate than most nursery trees, and planting has gone on in a gradual way. It takes several years to grow a tree large enough to bear paying crops, though such varieties as Paragon begin to bear a few nuts as soon as fairly established. The Chestnut weevil has been very destructive among plantings in brush or woodlands, but less so under orchard conditions, and will continue a serious menace until some practical means for its suppression is worked out. Mr. Hale's experience with spoiled nuts makes it plain that some method of curing, such as is practiced in southern Europe, must be adopted for our use if we are to save the nuts for market after we raise them. It seems the nuts are eagerly consumed in the localities where grown, which makes still another factor in keeping the home product out of the city markets. Altogether no valid reason for discouraging further conservative plantings has been given, though it is well not to entertain notions of extravagant profits. The improved chestnuts all make handsome and interesting trees, sure to increase the value of a country place. They are worth planting for their own sake, and when the great burrs begin to come much comment is certain to follow.

*

"With the sole exception of the farming interest, no one matter is of such vital moment to our whole people as the welfare of the wage-workers. If the farmer and the wage-worker are well off, it is absolutely certain that all others will be well off too." — President Roosevelt.

True; and the President might well have said outright what he implies, viz., that the prosperity of the farmer is the foundation of *all* National prosperity. We do not refer to the large landholders or those with abundant capital or superior powers of body and mind. They do not represent the truest type of the American farmer. We refer to the smaller freeholders—the men of middle class—those who fight the battle of life with weapons which they have been forced to forge for themselves in the fire of hardship and self-denial.

*

IT is often noticeable that educational movements especially designed for self-improvement take firmest hold in the country. The same is true of great moral movements; the country is usually the keeper of the city's conscience. Writing to a trade paper of a recent trip through remote sections of the Adirondacks, William Scott, who was chief of the department of floriculture at the Pan-American Exposition, remarks:

> I have frequently noticed that people living in the rural districts of our State, and doubtless other States, though lacking the flippant manners of our city boys and girls and perhaps considered hayseeds by them, are invariably better read and informed. They have the long Winter evenings to read and they get the weekly papers and "read, mark, and inwardly digest," while the average city boys or girls read the red letter headlines of the yellow journals and think they have absorbed it all. Don't make fun of the log school houses, they have produced Presidents of the United States, and the leading men of our great cities have nearly all been country born boys.

Those who are best informed as to rural conditions will agree heartily with what Mr. Scott says. A weekly paper well digested is better mental food than seven consecutive dailies swallowed whole. Reading without reflection soon becomes a disease—a form of mental dyspepsia. The city man who devours morning and evening papers, with several shrieking extras hot off the press between meals, is less able to form sound habits of thought than the farmer whose paper is not only read, but reflected upon afterwards.

*

THE new anti-oleo bill to be fathered by Mr. Tawney, of Minnesota, will be the first introduced at this session of Congress. That honor was awarded at a party caucus. This proves what we have repeatedly claimed—that the demand for this bill is stronger than ever among farmers. During the Summer the friends of honest butter were not idle, but they forced the fighting at every possible point. As a result the public has a better knowledge of the subject, and with this clearer view has come a greater respect for the farmer's position. It is understood that colored oleo is a counterfeit, and all men who are engaged in selling an honest product realize the importance of restricting a fraud. Many of those who formerly wondered why the farmers demanded this form of legislation now recognize its justice and importance. This gain in public sentiment gives the bill a much better chance than it had at the last session of Congress. Some public men are learning that the smear of oleo cannot be easily wiped out. For example, a correspondent sends us the following from a local Illinois paper:

> An Elgin correspondent says that "a cyclone of public sentiment" is developing among the dairymen in the northern part of the State which is likely to play havoc with the political prospects of Congressman Hopkins. The cause of the cyclone is the Congressman's alleged affiliation with ex-Congressman Lorimer and the oleomargarine interests. The butter and milk men say that they have evidence against Hopkins sufficient to defeat his return to Congress. If they are against him he would have no show in a contest for the Senate.

Of course the politicians bewail any effort on the part of farmers to carry such matters "into politics." For many years the farmers came, hat in hand, and asked these same politicians for favors. Now, they have learned their power—when they can get together in a just and fair demand. It will be a sad day for the oleo Congressman who gets in the way of their boots this year.

*

PRESIDENT Roosevelt discusses the "trusts" question at some length in his message to Congress. He says rightly that the American people are convinced that certain features and tendencies of the great corporations are harmful to the general welfare. The remedy he suggests is publicity. He would make these vast concerns show the people what they are doing and what becomes of the money they acquire. If Congress at present lack the power to enforce such publicity, then the President favors a constitutional amendment which shall confer such power. We feel sure that a majority of Americans will regret on first thought that the President did not go further than this in suggesting restrictive measures. On second thought, however, it is probable that most conservative people will conclude that the suggestions are wise. Perhaps they go as far as we may wisely go at this time. The trusts are here. They form a part of American industrial life, and a violent warfare against them might cause a calamity. Personally, we are opposed to the plan of giving these great corporations any benefit of a high tariff, because they restrict or kill home competition, while the tariff was supposed to stimulate it! There is great merit in publicity. Sunshine kills filth and foul disease germs, and clean printer's ink will drive both big and little rascals from cover. The people of this country are just aching to get a chance to vote on a constitutional amendment giving Congress power to regulate and control the trusts. Turn on the light—then we can tell better what to do!

*

LAST week we made some general remarks about the value of a *postage stamp vote.* Now for more definite suggestions. Here is a list of the Congressmen from New York State who are most likely to be influenced by a postage stamp. Address them at Washington.

Hon. Cornelius A. Pugsley.
Hon. Arthur S. Tompkins.
Hon. John H. Ketcham.
Hon. William H. Draper.
Hon. George N. Southwick.
Hon. John K. Stewart.
Hon. Lucius N. Littauer.
Hon. Lewis W. Emerson.
Hon. Albert D. Shaw.
Hon. James S. Sherman.
Hon. George W. Ray.
Hon. Michael E. Driscoll.
Hon. Sereno E. Payne.
Hon. Charles W. Gillet.
Hon. James W. Wadsworth.
Hon. James B. Perkins.
Hon. William H. Ryan.
Hon. De Alva S. Alexander.
Hon. Edward B. Vreeland.

We suggest that our New York readers write all these men if possible, or at least some of them, and request them respectfully to do all in their power to push the Tawney bill through the House. Most of these men need little urging, but a letter will do them no harm. The two men most in need of the stamps are J. W. Wadsworth and Sereno E. Payne. They should be plastered an inch thick. That is the way to brand and round them up. Come, gentlemen —*lick a stamp for bossy and the baby.*

*

BREVITIES.

It's an awful disease,
And its symptoms are these:
Your hat gets four sizes too small;
You see a big I
On land, sea and sky.
And think that you hear people call:
"Here he comes! Clear the way!
Speak in whispers to-day;
The great man of earth passes by.
His words weigh a ton,
And his wisdom's the won-
Der of millions of us poor small fry."
Sad delusion we fear;
But a remedy's near;
A man whacks some sense in your brain,
Give him thanks, suff'ring friend,
With disease at an end,
When the outcome for you is great gain.
For it's true as a try-square you'd better be dead,
Than to live on for ages, a case of large head.

THE nearsighted man is off on vision.

"EVERY hen her own stove"—page 834.

FEW farmers are well supplied with fuel.

READ "Shall We Grow Wheat?"—page 841.

THE kicker engages in a sole stirring business.

IT'S a good plan to root-prune some pedigrees.

A FAMILY tree is none the better for being shady.

YES, a brush with Jack Frost gives a hen a frozen comb.

AWARDS in the photographic prize competition given on page 842.

THE idle horse would better eat his head off than to eat the fat all off his ribs.

SHOW me the man and let me gaze my fill—the chap who really likes to pay a bill.

HOW does that statement of the cost of an acre of wheat—page 841—compare with a page from your own books?

SEE that your young orchard trees go into Winter quarters in good condition. The trees carry their Summer clothes in their trunks.

IN California, asparagus is packed loose in boxes, and then retailed to the consumer by the pound. This seems a very satisfactory plan, though the product may not look so attractive as in symmetrical bunches.

Events of the Week

DOMESTIC.—Clement Studebaker died November 27 at his home in South Bend, Ind. He was born in Adams County, Pa., March 12, 1831. He made his start in life in South Bend in 1852 in the blacksmith business with an elder brother, Henry. A Government contract for a hundred wagons was obtained, and the young firm from this beginning grew to be the present Studebaker Brothers' Manufacturing Company. Mr. Studebaker was twice a delegate to national Republican conventions, United States Commissioner for Indiana to the Paris Exposition of 1878, president of the Indiana Board or World's Fair Managers and a member of the Pan-American Congress during the Winter of 1889-90. . . . . A fire on the East River front of New York City November 28 started in a lumber yard, and by the crash of a big wall, released a torrent of naphtha in the adjoining property of the Standard Oil Company. A sea of fire flowed down the street, and only the most strenuous exertion saved a big gas plant. The total loss is believed to reach $750,000. . . . . November 27 a collision occurred at Seneca, Mich., between two passenger trains on the Wabash Railroad. Both trains were wrecked, taking fire immediately; 80 persons were killed, and 135 injured, many of whom will die. Of the dead, 50 were Italian immigrants. . . . . The ferryboats Sausalito and San Rafael collided in a dense fog in San Francisco Bay on November 30, and the San Rafael sank. It is known that three of her passengers were drowned, and it is feared that others were lost. . . . . Near Altoona, Pa., December 1, Mrs. C. W. Burk and her four children were burned to death in their home, the house burning so rapidly that escape was impossible. . . . . The South Carolina and West Indian Exposition at Charleston was formally opened December 2. Senator Depew was the orator of the day, and a message of greetings was sent by President Roosevelt. . . . . The British ship Nelson, from Astoria for Cape Town, with lumber, turned turtle off the Oregon coast on December 3, and went down with her entire crew of 28 men. . . . . The barges Gypsum Queen and Gypsum King are adrift in the Bay of Fundy with 10 men on board, having broken loose from a tow during the gale, December 2. Grave fears are felt for the safety of the men.

CONGRESS.—The first session of the Fifty-seventh Congress was opened December 2. Resolutions respecting the late President McKinley were introduced in the House by Representative Grosvenor, simultaneously with the introduction by Mr. Foraker in the Senate of the same resolutions. The Secretary of the Interior sent to the House a copy of a resolution of the Legislature of Hawaii asking a duty on coffee, in order to protect the coffee industry of Hawaii. The presentation and reading of the President's message and the adoption of resolutions for a joint committee to consider by what token of respect and affection Congress might express the sorrow of the nation upon the tragic death of the late President McKinley was the only business in Congress December 3. Both Senate and House adjourned as a further mark of respect, the House until December 6. The message occupied about 2½ hours in reading. While there are differences in regard to the utterances of the President on some of the subjects treated, all agree that it is a strong, well-written document, characteristic of the writer. The first five of the 45 printed pages covered are taken up with the assassination of President McKinley and discussion of measures that are needed to punish anarchists. After strongly eulogizing the late President and denouncing the assassin, the message urges action by Congress that will suppress anarchists at home, and prevent the coming to this country of persons professing principles hostile to all government and justifying the murder of those placed in authority.

The question of trusts was touched upon. There is a popular belief that the great corporations known as trusts are in certain features and tendencies hurtful to the general welfare. This is based upon sincere conviction that combination and concentration should be supervised, and within reasonable limits controlled, and with this judgment the President agrees. He believes that a law can be framed which will enable the Federal Government to exercise control along lines indicated in the message, but if Congress should decide that it lacks the constitutional power to pass such an act, he recommends a constitutional amendment. Immigration laws were pronounced unsatisfactory. An educational test is recommended, which would "tend to decrease the sum of ignorance so potent in producing the envy, suspicion, malignant passion and hatred of order out of which anarchistic sentiment inevitably springs. Finally, all persons should be excluded who are below a certain standard of economic fitness to enter our industrial fields as competitors with American labor." Tariff revision is not recommended. The President says the condition of the merchant marine is such as to call for remedial action by Congress and the advocates of the Ship Subsidy bill are encouraged by his utterances on this subject, although there is no positive recommendation for the grant of subsidies as a direct means of reviving our commerce on the sea. Several pages are devoted to urging action for the preservation of the forests and the wild game, and measures for establishing a system of irrigation for the reclamation of the arid lands of the West. With regard to the colonies, the President says all legislation should be shaped to establish healthy American communities who would own and till the farms, and that the land policy for the islands should be modeled on the United States homestead system. Cuba will soon be established as an independent Government, and "there are weighty reasons of morality and of National interest why the policy of reciprocity should be held to have peculiar application," and the attention of Congress is directed "to the wisdom, indeed, the vital need of providing for a substantial reduction in the tariff duties on Cuban imports into the United States." The Philippine problem is discussed at length. The earnest effort of this Government is being directed to assist the Filipinos along the stony path that leads to self-government. "We hope," says the message, "to make our administration of the Islands honorable to our nation by making it of the highest benefit to the Filipinos themselves, and as an earnest of what we intend to do point to what we have done." Additional legislation is recommended for the introduction of industrial enterprises. Recommendations are made for upbuilding the navy and for an increase in its personnel. This is regarded as essential to our honor and material welfare, as well as to our peace in the future. The establishment and organization of a strong naval reserve is also recommended. 'The navy offers the only means of making our insistence upon the Monroe Doctrine anything but a subject of derision to whatever nations choose to disregard it.' It is not deemed necessary to increase the army beyond its present size, but it is necessary to keep it at the highest point of efficiency. He recommends that provision be made for field exercises by at least a division of regular troops once a year. An extension of the Chinese Exclusion act, which expires next year, was advised.

PHILIPPINES.—On account of insurgent activity in Batangas Province more troops are being sent from Manila to reënforce the garrison there. . . . . The financial situation in the Philippine Islands is causing considerable alarm. The United States post office at Manila now refuses, except to Government employees, to issue money orders in exchange for Mexican silver, but merchants and others are forced to carry their accounts in Mexican silver. The commercial community had relied upon the United States Philippine Commission to continue accepting two Mexican dollars for one gold dollar, but the Commission is unable to act without the authority of Congress. The stores of Manila are compelled to accept two Mexican dollars for one gold dollar, while Chinese speculators are paying as high as six per cent premium in American paper money for American gold. . . . . American deserters are becoming very bold on the island of Samar, and are believed to have planned the massacre of Company C, Ninth Infantry. It is generally understood in Manila that deserters from the Ninth Cavalry, colored, are causing the trouble in the Province of Batangas.

GENERAL FOREIGN NEWS.—The United States is preserving order on the line of the Panama Railroad, preventing either Colombians or Liberals from using the railway. Order is being preserved at Colon by American, English and French warships. . . . . Miss Stone and Mme. Tsilka are still held captive, and measures for their relief are no further advanced.

FARM AND GARDEN.—The New York Experiment Station at Ithaca is preparing to send out weather reports to farmers, which will be furnished through the rural mail delivery. By this means farmers will receive warning of storm or frost in time to take precautions demanded by their work.

Secretary Snow, of the State board of sheep commissioners of Wyoming, reports an almost total absence of scab and other infectious diseases among the range flocks. During the year the Government inspectors have condemned only two droves.

The National Live Stock Association will approve a bill to be submitted to Congress reserving to the Federal Government the exclusive right to prepare and sell antitoxins.

The Association of Agricultural Colleges and Experiment Stations met in Washington recently. After the adjournment of the convention, the Association of Agricultural Chemists spent three days in discussing questions of chemistry dealing with adulterated foods and food products and other allied subjects. At the concluding session, Dr. Wiley, the Chief of the Bureau of Chemistry of the Department of Agriculture, was chosen the secretary for the forthcoming year.

A part of the coming short course in agriculture at the Agricultural College of Kansas, at Manhattan, January 7 to March 28, 1902, is live stock judging. Competent instructors, for years judges at the great live stock fairs, have been secured for this work of the short course, which is also to include instructions in butter making and milk testing under competent instructors.

Indiana breeders of Aberdeen-Angus cattle organized a State breeders' association November 21. Thirty-six breeders joined the association. The election of officers resulted as follows: President, W. R. Pleak, Greensburg; vice-president, F. C. Fleming, West Lebanon; secretary and treasurer, Geo. Henderson, Lebanon; directors, T. C. Phelps, New Castle, and Geo. Swain, Pendleton. The annual meeting will be during the week of the meeting of the State Board of Agriculture.

Representatives of the dairy boards of trade in New York met at Syracuse last month and organized a State Board of Trade, to look especially after State and National legislation. Organization was perfected and the following officers elected: R. P. Grant, Clayton, president; W. A. Rogers, Watertown, secretary; B. D. Gilbert, Clayville, treasurer. Executive committee: The three officers named, C. W. Richardson, Little Falls, and A. D. Martin, Canton. The president of each local board of trade becomes vice-president of the State association by virtue of his office.

Symptoms of renewed discrimination against American meat are manifest in the new imperial inspection laws of Germany, which, when passed, it is generally supposed, will affect domestic as well as foreign produce. The new laws will become effective April 1, 1902, but only as far as imported meat is concerned. The date on which German meat will be subjected to the rigid new system is left open. The new law will absolutely exclude pieces under four kilos' (eight pounds) weight. The American trade in these goods is not specially extensive but very valuable. The feature of the law providing for inspection at the boundaries of the country is desirable, but it makes possible a considerably earlier examination of meat than is possible under the present system of inland inspection.

The Wayne Co. (N. Y.) Fruit Growers' Association met at Newark, N. Y., December 11, for the purpose of electing officers.

The champion trotter Directum, with a record of 2:05¼, has been purchased by the International Stock Food Company, of Minneapolis, Minn., the price paid being $12,100.

The Virginia State Horticultural Society will meet at Richmond January 7-8, 1902. Secretary, Walter Whately, Crozet, Va.

The New York State Breeders' Association will meet at Rochester December 17-19.

The next meeting of the Eastern New York Horticultural Society will be held in New York City, February 12-13, 1902. Full notice of it will be given later.

SHALL WE GROW WHEAT?

The farmers in central New York have received such an impressive lesson this season, in the growing of wheat, that profit and loss in the business is now, for the first time, a subject of serious consideration. Whether to continue the buying of costly fertilizers and trying to raise a crop of wheat in competition with the great and growing West and the Hessian fly, or adopt some other system of farming, and if so what, is a question of serious, special and immediate interest to the farmers in, at least, 20 counties of central and western New York. Aided by farmers' institutes, experimental stations and the practical presentation of farming methods by acknowledged standard publications, the agricultural people all over our country, and especially in the Empire State, are beginning to "keep books," and in the account book of one of our practical farmers is found, for the season of 1901, the following estimated cost of growing one acre of wheat: Plowing, $3; harrowing, rolling, drilling, $3; seed, $1.50; phosphate, $2; thrashing, $1; total cost, $10.50. The product of the field was an average of 20 bushels, which is probably a liberal average in central and western New York, and the charge for thrashing does not include the feeding of horses nor a dinner for hungry men. The credit side had 20 bushels of wheat at 70 cents a bushel, or a balance for one acre of $3.50. Deduct from this the interest on the land at $50 an acre—which is $2.50—and we have $1 left for taxes, insurance and a new point for the plow.

The continued low price for wheat in all of this section, taken in connection with losses by the chinch bug, the sparrows and the Hessian fly, has compelled our farmers to consider whether there may not be some product substituted in the place of wheat, in at least a part of farm management. The discussion has not yet become general, but up to this time, the predominating opinion is for the raising of cattle for the dairy or beef, or for both, and the inducement for this change is the belief that beef, in average price, will never be lower, and that wheat will never be higher; that the ranges on the vast plains of the Middle West are fast decreasing as pastures and are being taken up as farms for the growing of wheat and corn. A discussion of the subject is not intended in this article, but simply and very briefly to call attention to a matter of increasing interest in this State. Figures and facts in dairying and in stock raising as contrasted with the growing of wheat, can be fully presented, and surely should be in a full and fair investigation of such important departments in our agricultural industries. C. F. B.

Auburn, N. Y.

Crop Reports.

The past season has been a good one in some ways for farmers. We realized a little over $100 from seven hogs this season. Gilt edge separator butter made on the farm is growing more in demand than ever before. A string of private families as consumers of it make a good market, and you don't have to contend with the middleman. M. E. G.

E. Smithfield, Pa.

Some localities throughout what is called the fruit belt of Illinois report an abundant crop of apples of good quality, while others have only a fair crop. The amount of salable fruit is evidently above the average; of those grown for market Ben Davis would head the list; then would come Jonathan and Minkler. The price this year has ranged from $2.50 for firsts to $1.50 for seconds per 2½-bushel barrel. The culls go to the evaporator for from 15 to 40 cents per 100 pounds, according to quality. Good apples at the present time would bring $1 per bushel in bulk. Of course, we see times that we would be glad to get 25 cents per bushel for all Summer and Fall apples. J. W. M'C.

Kinmundy, Ill.

MICHIGAN NOTES.—We have been having very fine weather for Fall work. In our immediate vicinity this has been one of the best seasons in years. On our farm six acres of potatoes gave over 900 bushels of good tubers, without fertilizers. They were Sir Walter Raleigh, for main crop, with Pat's Choice for a trial, which did remarkably well, and for early we had 275 bushels of Early Wonderful, certainly the finest eating potato we ever tried. Our corn crop was also good, about 125 baskets per acre. We have our stalks in the barns and stacks, and cut all fodder as fast as we use it. Early in July we drilled three acres of Evergreen sweet corn on some new muck ground, drilling in rows 28 inches apart with grain drill. It made a wonderful growth, completely covering the ground. The fodder did not dry out sufficiently to put into a stack or barn, and we have it in large shocks. In cutting fodder we cut a few bundles of this and a few of the husked stalks, and it makes a most excellent feed for sheep and cattle. We have had a very dry Fall, and pasture is thus short, and we are having to feed all stock now, although the weather is open and fine. Our Shropshires are in fine shape, and while the ram trade has not been quite up to expectation, the trade in choice breeding ewes gives promise of the best since we have been breeding them—about 15 years. It is certainly the proper time to start a good flock of sheep, as better animals can be bought now for the same money than in times when all sheep are high, and as the price of wool is becoming stronger, and sheep are being marketed faster than produced, I believe that another year will see great activity in sheep, and much higher prices prevailing. It is the great mistake of the American farmer to sell out when stock is cheap, and buy back when it is high. A few good sheep can be kept on any farm turning weeds and other stuff that would otherwise go to waste into money, and they produce two good crops a year. A few of them on a farm will almost take care of themselves. It is only when they are kept in large numbers that they require special care, and the cost of keep becomes considerable. Choice animals of any kind or breed always bring paying prices, while the common to culls always have to be sold at a loss. A. H. F.

Allegan Co., Mich.

Woman and Home

From Day to Day.

DEAR UNSELFISH DAN.

'Most every one that knew our Dan
Agreed he was the kindest man
They ever see. He had the knack
Of takin' on his own broad back
The burdens an' the slaps and pokes
Belonged by right to other folks.
If anyone was in distress
An' went to Dan, he'd say: "I guess
We'll pull you out all right; let's see.
Suppose you leave all that to me."

Was nothin' finer than the way
He cared for poor old Uncle Jay,
Who was the most unlucky han'
For havin' trouble with his lan'
'Bout taxes, or the early Spring
Plowin', or some other thing
That plumb upsot the poor old man.
Then, in the nick o' time, our Dan
Steps in, and says, "Oho!" says he,
"Suppose you leave all that to me."

It got to be that Uncle Jay
He couldn't git along no way
Without our Dan, an' our Dan he
Jest cared fur him unselfishly.
An' when the old man come to die
Our Dan, o' course, was right close by.
Says Uncle Jay: "I'm worrit, Dan,
'Bout what's to come of all my lan'
An' all my money out at loan,
An' in the bank, when I am gone."
Then Dan, he ups an' says, says he:
"Suppose you leave all that to me."

—Catholic Standard and Times.

*

ONE of our friends who has been interested in the discussion of home work for country girls, says in a recent letter:

I have lately discovered a new field for women. I fixed up a buggy, painting and varnishing it and oiling the top, etc. A neighbor saw the vehicle after it was finished, and he asked me how much I would ask to do his for him. Carriage painters charge $8 or $10 for such a job.

*

A CUP and plate rack, composed of two shelves, fitted into some little recess in the dining room, is not beyond the skill of a home carpenter, and is an attractive convenience. Midway between the two shelves a rod, fitting into brackets at the sides, prevents the plates from slipping. Brass screw hooks are put under the bottom shelf to hold cups, and the upper shelf is kept for tall pieces of china, such as pitchers or bowls. The rack should be painted or stained to match the woodwork of the room.

*

IN the modern wardrobe or clothes closet, a number of hooks are put under the shelf, on which to put coat hangers for the dress waists. Skirts go back along the wall, while the waists are hung separately. Coat hangers for women's use seen in the shops now are almost as elaborate as pincushions, but they are easily made, and are pretty and useful gifts. The ordinary wire hangers are padded with cotton batting, scented with sachet powder, and covered with gay silk, shirred on. The loop by which it is hung is twined with narrow ribbon, and a rosette is put where the loop and hanger join.

*

ONE noticeable thing about the photographs sent in for the competition recently announced in this department is the wide range of country they represent, coming from as far away as the Pacific coast. Another thing is the comfortable living they imply. Conditions are still hard for the housewife on many farms, and conveniences are often lacking, but the general standard of comfort has greatly advanced. The greatest drawback, in many cases, is the lack of help. It is not only difficult, but often impossible for an overburdened farm housewife to secure help in the home, and since there is so much unavoidable work, it is absolutely necessary that her convenience be considered, and her work simplified. We often see some slight inconvenience, some error in arrangement, which entails extra labor, permitted to remain year after year, when a trifling outlay of money or time could rectify it. The nervous and muscular force wasted in this way means much in a woman's life; unfortunately, it is a form of extravagance many mistaken people look upon as economy.

*

A READER asks whether it is difficult to make chocolate creams. The recipe is very simple. Put the white of one egg and an equal quantity of cold water into a bowl; add a teaspoonful of vanilla, and beat until frothy. Stir in sufficient confectioners' sugar to make a stiff paste (about 1¼ pound). Work until smooth, form into small balls the size of a cream chocolate, stand on greased paper, and put in a cool dry place to harden (about two hours). Put one-half pound chocolate into a small bright tin basin, and melt over boiling water; then stand in a basin of boiling water to prevent it from cooling. Place one ball on the end of a fork, dip it down in the melted chocolate, so that it is well covered, scrape off the fork carefully, then slide the cream back on the greased paper. When all are dipped, stand in a cool place over night. They are very nice.

A RAINY-DAY VISIT ON A RURAL WIRE. FIG 379.

A Telephone Talk.

The picture shown in Fig. 379 is a genuine rural telephone scene, photographed in a home where THE R. N.-Y. is a valued weekly visitor. When the picture was taken little Bernice was in the attitude of listening to an entertaining talk that was then going on over the wire. She is a five-year-old resident of Cuyahoga Co., Ohio, but is not too young, however, to use the telephone all by herself. That is one of the beauties of the rural telephone. The little tots just shove a chair up to the 'phone, call up central, and get their little friends, and have as jolly a visit as the older ones. In stormy, disagreeable weather when they cannot go out it greatly relieves the monotony and tediousness of the day. The rural telephone has a great and increasing value in relieving the solitude of farm life, apart from its convenience and utility in transacting business.

A. R. PHILLIPS.

The Photographic Competition

The competition for prize photographs of domestic subjects first announced October 19, is now ended. The winners are:

First Prize, $7.00, Mrs. S. J. Perry, Michigan.

Second Prize, $5.00, Mrs. Hugh Aiton, New Brunswick, Canada.

Third Prize, $3.00, F. Housholder, Oklahoma.

So many excellent pictures were received that the final judgment required much thought on the part of the jury of five persons forming the decision. It must be remembered that *domestic* subjects were called for; hence this point was the first considered. Several fine pictures, which will appear later in THE R. N.-Y., were precluded from participation in the prizes merely because they were general, rather than domestic, in interest. The second consideration was the value of the picture for reproduction in a half-tone engraving. We were obliged to put aside some excellent domestic views because they were deficient in this point. The three prize-winners meet the requirements of the competition; they are fine photographs, and effective pictures. Most of the other pictures will, however, be used; some of them are so admirable that they are entitled to a prominent place in our pages. Indeed, the results of the competition are so excellent that we shall feel impelled, at no distant date, to offer further prizes for another series of rural photographs.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal". See our guarantee 8th page.

For the Church

THE LADIES' HOME JOURNAL and THE SATURDAY EVENING POST offer you a better way of raising money—easier and surer and more profitable than fairs, teas or suppers.

There may be several hundred dollars in it; maybe over $1000. You can surely earn as much as in fairs, etc., and with less trouble, if you'll do a little systematic work. Write to

Wisconsin Traveling Libraries

Wisconsin is rich in libraries. The very extensive city libraries of Milwaukee and other cities are patronized and appreciated by the student body and urban residents generally. Even country towns in the older settled portions of the State support very respectable libraries. These, however, reach only the city and town people. The thousands of families in the pine woods of northern Wisconsin and in other remote regions, miles from a railroad, are not benefited by these libraries. The pitifully scant supply of literature available in these regions, has led certain large-hearted people to establish traveling libraries. The first of these was set in motion in 1896. In that year J. H. Stout, a wealthy lumberman of Dunn Co., Wis., purchased 500 volumes of good books, and accepted from his neighbors hundreds of copies of magazines, etc. These were divided into 16 lots, each put up in a strong case with a shelf, double doors with a lock and key, a record of the books and copies of the rules, etc. These miniature libraries were then sent to points in Dunn Co., each accompanied by the following letter from Mr. Stout:

You may have the use of these libraries under certain conditions. You must form local library associations of responsible people, and elect a secretary to represent you in dealing with me, and a librarian to deal with you. You must agree to have the books well cared for, and to keep them in a convenient place where every resident of the neighborhood who uses the books carefully, can get them without cost. Persons who misuse the books or destroy them, must pay proper penalties. When most of the readers have read as many of the books as they wish, the library may be exchanged for another. For each library sent you will pay a fee of $1. In consideration of this fee I will pay all transportation expenses for the first library, and all the expenses of furnishing the libraries, repairing the books and keeping up the supply of blanks.

It is needless to say that these were gladly received and the demand for more became so urgent that Mr. Stout soon sent out 20 more libraries under similar conditions. Following this lead, others have started similar libraries in other sections, until at the present time 215 are in operation. These are all under the supervision of the Wisconsin Free Library Commission, a body created by legislative enactment in 1895. The Commission is composed of five members and its duties are to "give advice and counsel to all free libraries in the State, and to all communities which may propose to establish them, as to the best means of establishing and administering such libraries, the selection of books, cataloguing and other details of library management."

A wide range is covered in the selection of books. Biography, travel, fiction and juvenile literature, all of the highest order, are selected. Eggleston, Scudder, Dickens, Conan Doyle, Scott and Louisa Alcott are some of the names one meets in looking over a catalogue. The libraries are located mainly in farmhouses and country stores. They are, without exception, well received and patronized. Each is in charge of a librarian, who requires the patrons to observe certain regulations, similar in many respects to those of city libraries. For instance, a book may be retained but two weeks without renewal or the payment of a fine. The borrower is liable in full for the loss of a book or damage to the same. The books sent out in the earlier libraries were mainly light literature. In the later ones these have been replaced in part by more solid reading, in the endeavor to create a taste for the best. It is probably too early yet to judge definitely of the merits or demerits of the system, but the tendency so far is all in the right direction.

The location of the libraries as indicated on an outline map of the State in the office of the secretary shows them as clustered mainly about the points of origin, that is near the homes of Mr. Stout and others in the pine woods regions, but a few are seen straggling into the southern part of the State, and one within 20 miles of cultured Madison. Fifty dollars covers the entire expense of one of the libraries and there is but little doubt that within a few years thousands will be in operation.

FREDERIC CRANEFIELD.

The Rural Patterns.

Golf capes are very serviceable as extra wraps, especially when driving. The model shown is simple and tasteful, made of double-faced cloth simply stitched; but plain cloth with hood alone or with cape and hood silk lined is also in vogue. The cape is seamless and closes at the front with buttons and buttonholes. The hood folds becomingly over the shoulders. At the neck is a turn-over collar of the cloth. To cut this cape for a girl six years of age 1¼ yard 50 or 56 inches wide will be required. The pattern No. 3988 is cut in sizes for girls of 2, 4, 6, 8 and 10 years of age; price 10 cents from this office.

A cap and muff to match are pretty and useful. The pretty little models shown are made of velvet cord in Napoleon blue, with an edge of chinchilla fur, but all velvet, velveteen, corduroy, heavy silk and soft cloths are appropriate, and ruchings of silk or net may take the place of the fur. The little cap fits snugly and is drawn in at the back edge to fit the circular crown. The neck frill is gathered and seamed to the lower edge, but can be omitted when preferred as shown on figure. Attached to the lower edges are ties which are bowed beneath the chin. Soft silk or satin is used for lining. The muff is simply constructed and can be easily made. Over the satin lining the material is arranged and both stitched together some distance from the edge to form a casing, through which elastic is inserted to draw up to the proper size. The frilled edges thus formed are trimmed with fur, but may be plainly finished if preferred. Bows of ribbon, animal heads and tails may be added if a more

3988 Girl's Golf Cape.
2 to 10 years.

elaborate muff is desired. To cut this cap and muff for a child two years of age 1¼ yard of material 20 inches wide, ⅝ yard 44 or 50 inches wide will be required, with 1⅝ yard of fur for edging and one yard of silk for lining. The pattern No. 3990 is cut in sizes for children of 1, 2, 4 and 6 years of age; price 10 cents from this office.

Rural Recipes

Hungarian Chicken.—Clean and cut up a large chicken as for fricassee, put it in a small pan with two ounces of butter and two onions cut into small pieces. When beginning to color add two ounces of flour, mix well with your other ingredients. Moisten with one cupful of milk, add a teaspoonful heaping of salt, one-eighth of pepper, two cloves of peppercorns, ditto of bay leaves, and tie all together. Boil very gently, skim off the grease, remove the spices and serve.

Fried Cornmeal Puffs.—Mix one-fourth teaspoonful of salt and one-fourth teaspoonful of soda with one cupful of fine white cornmeal and scald it with boiling hot water, adding it gradually until the meal is all wet and swollen, not at all soft, but barely damp enough to hold it together. Cover it and let it stand over night. In the morning

3990 Child's Muff and Cap
1, 2, 4 and 6 years

stir in two eggs, the yolks and whites beaten separately. The mixture should be a soft dough, not thin enough to spread when dropped on the pan, and as meal varies in its thickening quality, it will be well the first time to add the egg gradually, lest the mixture be too soft. Take it up in small spoonfuls and drop into a kettle of hot fat and when brown turn like doughnuts.

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

The Girl on the Farm

It seems to me that there is no way in which a young woman can earn money with so little outlay of time and strength as in keeping bees. I have found from my own experience that there is no comparison in the amount of work involved between poultry raising and work in the apiary. The lack of knowledge need not keep one from trying it if she will study some good work on the subject, such as Root's A B C of Bee Culture. The more one studies this subject the more interested she will become, and not only are you able to furnish your own table with an abundance of pure honey, which is the most delicious and healthful of all sweets, but your friends will be glad of the opportunity to buy any surplus that you may have to sell. The fact that bees do not require any care through the Winter is one that recommends itself to any woman who has tried keeping poultry. From the time they are put into their Winter quarters in November, until the warm April days tell us that it is time to bring them out into the sunshine, we need hardly give them a thought. I have often wondered why this subject has not been discussed in THE R. N.-Y. from a standpoint that would interest the wives and daughters of the farmers and fruit growers in this healthful and profitable way of earning a little extra money.

BUSINESS BITS.

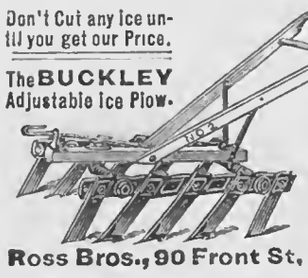
THE Chicago House Wrecking Co., of 35th and Iron Sts., Chicago, has purchased the buildings complete of the Pan-American Exposition, Buffalo, N. Y. It is understood that the purchase price was $132,000. The buildings will, of course, all be dismantled and removed from the grounds, and the above company will dispose of the material through their mail order business.

IT may seem incredible that a good time-piece can be bought for the small sum of $1. The Ingersoll dollar watch is now famous in Europe as well as America. Two million of these watches were purchased during the past Summer by an English house. A handsome and interesting catalogue may be had free by addressing R. H. Ingersoll & Bro., Department 230, 67 Cortlandt St., New York.

THE Home Correspondence School has prepared a very careful, conscientious and thorough course on all phases of the great farm industry. The head of the school is Prof. W. P. Brooks, of the Massachusetts Agricultural College. This fact alone speaks volumes for the stability and high character of the instruction offered. A thorough course is taught by mail. A portion of the spare moments and long evenings devoted to this study, will gain the knowledge to enable you to get from the farm those profits which have been going to waste. The Home Correspondence School of Springfield, Mass., will send catalogue and a pamphlet, "Money in Farming," with other valuable points, free. We feel sure it will pay you to send for them.

Don't Cut any ice until you get our Price.

The BUCKLEY Adjustable Ice Plow.



Cuts any size cake, from 18 to 30 in.; runs easy; will last a lifetime; will do as much work as any $50 00 Plow made. We sell, to introduce, at about one-third of that. Send at once for circular and price.

Ross Bros., 90 Front St, Worcester, Mass.

Free Public Lands.

Free Homesteads
Free Timber Lands
Free Grazing Lands
Free Mineral Lands
Free Stone & Coal Lands

Located by Counties, and giving fullest information about free government lands and how to secure them.

100 pages packed full of information to Land Seekers.
A BILLION ACRES OPEN TO FREE ENTRY.

VACANT GOVERNMENT LANDS is the title of a new book just published giving the number of acres and the kind of land described that is open to settlement in each county of every public land State and Territory. The location of each land office to which applications are to be made, with blank form of application. It tells about irrigation and irrigated lands. About oil and saline lands. How to acquire townsites and millsites. With many diagrams and tables revised up to date. This book will be mailed to any address with six months' subscription to THE FARMER, St. Paul, Minn. The oldest and leading farm paper in the State, all for 25 cents.

W. F. Allen Land & Imp. Co., Salisbury, Md.

GLENN RANCH,
Glenn County, California,
FOR SALE IN SUBDIVISIONS.

This famous and well-known farm, the home of the late Dr. Glenn, "the wheat king," has been surveyed and subdivided. It is offered for sale in any sized government subdivision at remarkably low prices, and in no case, it is believed, exceeding what it is assessed for County and State taxation purposes.

This great ranch of 40,000 acres runs up and down the western bank of the Sacramento River for 15 miles. It is located in a region that has never lacked an ample rainfall, and no irrigation is required.

The river is navigable at all seasons of the year, and freight and trading boats make regular trips.

The closest personal inspection of the land by proposed purchasers is invited. Parties desiring to look at the land should go to Chico, California.

For further particulars and for maps, showing the subdivisions and prices per acre, address personally or by letter,

F. C. LUSK,

Agent of N. D. Rideout, Administrator of the Estate of H. J. Glenn, of Chico, Butte County, California.

WE BUY AND SELL
Dutton Corn and Pop Corn. Canada Peas, Cattle and Poultry Feed, Grass Seeds, Rice Meal, etc. CHAS. H. REEVE, 187 Washington St., New York City

For Sale—I have the New Era Cow Pea for sale. They have been tried from Maine to Florida, and are without a rival. It is the earliest and most prolific pea grown. J. C. LITTLE, Louisville, Ga.

GEO. P. HAMMOND. EST. 1875. FRANK W. GODWIN.
GEO. P. HAMMOND & CO.,
Commission Merchants and Dealers in all kinds of COUNTRY PRODUCE, Apples, Peaches, Berries. Butter, Eggs, Cheese, Poultry. Mushrooms and Hothouse Products a Specialty. Consignments solicited. 34 & 36 Little 12th St., New York.

POULTRY SHIPPERS.
We make a specialty during the Winter months of handling Poultry, having a very extensive trade. Write us for any information you may wish regarding dressing, packing, etc., and we will be pleased to answer all inquiries.
Returns made on sale of each shipment.
ARCHDEACON & CO., 100 Murray Street, New York.

IF YOU HAVE ANY POULTRY or GAME to market, why not ship to a house that gives its entire attention to that line? We are the most exclusive poultry handlers on our market. We positively guarantee you outside market prices at all times, with prompt returns. If you have never shipped to us, we ask you to look up our responsibility carefully through Dun's, Bradstreet's People's Bank of Buffalo, and all Express Companies. For further references write to us for names of shippers in your section who are sending us their poultry regularly. Send us your name and we will keep you posted on our market. We will also send you full directions how to dress poultry for our market. HARLOW BROS., Commission Merchants, 141-143 Michigan St., Buffalo, N. Y. Write us.

Do You Wear Rings?

No. 77.

Perhaps you would like one to use as a holiday remembrance to some friend. We have been able to make arrangements with a manufacturing jeweler by which we can furnish handsome rings with stone settings at surprisingly low prices. These rings are rolled gold, with a five-year guarantee. We offer four styles. No. 77 is a single stone. You can have any color stone or any size ring. Price, 25 cents. No. 81 has three stones, Tiffany shape; you can have three combination of colors, and any size. Price, 25 cents. No. 66 is a cluster of imitation diamonds with center stone, which may be had in any color. Price, 75 cents No. 55 is an Egeria diamond scarf pin. This is a gold-plated pin on German silver, which gives a high finish. The setting is new and gives a pretty effect. Price, 25 cents. We will send any one of these rings or the pin as a reward for one new subscription at $1, except No. 66. We will send this for a club of two new subscriptions, or with one new and 25 cents extra. Select ruby, emerald, opal or diamond for single stone, and for the combinations two emeralds and one diamond; two rubies and one diamond; or two opals and one diamond. Measure size of finger carefully with narrow slip of paper, and send this with order. The rings are sold only to subscribers or their families.

THE RURAL NEW-YORKER, NEW YORK.

As We Go to Press.

STRONG ARGUMENTS.

We have all heard of "women farmers." THE R. N.-Y. has a number of them on its list. They are usually good farmers and ideal subscribers. What do we mean? Well, read this note from a Connecticut woman who has just sent us a new subscription:

The man came to ask me if he could sell me any milk. He asked how many head of cattle I kept, and I told him 30, besides my three horses. He wanted to know how long my feed would last. I told him I expected it would last until I turned out in May. Well, it was fun to look at him. He owns 130 acres and I only 20, and five of that are of no use. I told him I depended on THE R. N.-Y. to help me, and he guessed he would try it, so send it to him as soon as you can.

Certainly, Madame—it goes at once! Now this lady is a good farmer—as is evidenced by the fact that her barns and silos are well filled with the products of her small farm. We call her an ideal subscriber because she does not hesitate to say, right out, that THE R. N.-Y. has helped her. You see she gave that man to understand that the dollar which she invested in THE R. N.-Y. had swollen so that it nearly cracked the silo and hay mow. Of course the man had a dollar to invest in the same way. Her remarks were certainly "words fitly spoken," and every reader of THE R. N.-Y. might easily do as much. Some men say they will never let a woman beat them! In a case of this sort they ought to get two new subscriptions in order to keep ahead!

10 Weeks for 10 Cents.

We do not want our friends to forget these trial subscriptions this month. The cash prizes for clubs will be distributed January 1. The clubs are yet small, and anyone who can do a little work now for the remainder of the month can earn one of these prizes. This is the best time of all the year for the work. Our regular subscribers are responding nicely with these trial subscriptions. Small lists are coming in every day, but there are many yet to hear from. Every reader can certainly send at least one, and we still hope to hear from those who have not responded yet. We want to reach that 20,000 mark for trial subscriptions before the close of the year. We will send samples if you want them.

THE RURAL NEW-YORKER,
New York.

BOOK BULLETIN

FOR SALE BY THE RURAL NEW-YORKER.

THE AMERICAN STANDARD OF PERFECTION contains the authorized description in detail of all purebred varieties of poultry. It is the Bible of the Breeder, and no one who pretends to be up to date can afford to be without it. By its aid you can determine the quality of the birds you buy or sell, or the probable chance of winning of any you wish to send to a poultry show. It will be sent postpaid from this office for $1.

ASPARAGUS CULTURE, by F. M. Hexamer. This is a concise volume of 168 pages, which treats its subject very fully, discussing the most approved methods of growing the product, and preparing it for market. The methods given are not confined to any one locality, but extend over a wide range, from the Atlantic coast to California. Up-to-date methods of forcing asparagus are described, as well as outdoor culture, and insect enemies and diseases are discussed. It will be a valuable aid to any grower of asparagus. Price, postpaid, 50 cents.

A DEFINITE program for the weekly issues of The Youth's Companion for 1902 has already been arranged and printed, from which one can readily judge if the paper will be worth its cost for the coming year. The names and writers of the principal contributions are given, and one cannot look through the 28 pages of this prospectus without feeling that The Companion will be more interesting, more instructive and more inspiring than ever in the past. The Youth's Companion has now entered upon its fourth quarter of a century. As in the past so for 1902 the foremost men and women in the English-speaking world have been enlisted as contributors, while the work of an unprecedented number of new and promising writers has also been secured. Thus the constantly increasing demand for the best reading suited to all members of the intelligent American household will be fully met. More than 50 special articles by such men as President Roosevelt, Secretary Long, Bishop Potter and Lyman J. Gage, Secretary of the Treasury, will be given during the year, besides fully 200 stories by the most popular writers of fiction. Every issue of The Companion will possess real interest for every member of the family. Those new subscribers who send their subscriptions to the publishers at once will receive all the weekly issues of The Companion for the remainder of 1901, as well as the beautiful Companion Calendar for 1902.

THE RURAL NEW-YORKER,
409 Pearl St., New York.

MARKET NOTES

POTATOES are 50 to 75 cents per barrel higher than three weeks ago. The cause appears to be the disinclination of farmers to sell at present. Those who had made up their minds to sell early, either because of lack of storage facilities or the belief that prices would not be higher, have disposed of their crop, while others have decided to hold until Spring. These high figures, however, are likely to change the minds of some holders, and draw out extra supplies. Just at present is a favorable time to dispose of potatoes in this market, though there is no certainty that these conditions will last long, as considerable foreign and western stock is on the way.

POP-CORN NOTES.—A reader asks about the market for this in New York. Dealers have had such severe losses on account of the corn getting wormy that they are cautious about stocking up heavily, and few can be found who care to take any large quantity unless they see an immediate outlet for it. Most of the corn retailed is shelled and put in packages holding about one pound. If in good condition when put up, and kept airtight the corn saves very well, although we have seen packages where the contents when emptied would remain solid, being full of webs. To be best the corn should be at least a year old, as the new crop is not considered fit for use. A man who handles large quantities of corn gave me the following startling explanation as to why it becomes wormy: "Now that corn, if it is kept cool, will be all right until next Summer. Then the heat will make the life of the corn change to a worm which will eat its way out and turn into a moth miller, the same kind that eats your clothes in Summer. It's easy enough, just simply vegetable life changing to animal life." This way of accounting for it seemed perfectly reasonable to him, although it reminds one of the snake that swallowed himself, and would hardly pass muster with the scientific men.

LATE COMERS.—"Yes," said a poultry man on November 29, "there are 10 barrels of turkeys that should have been here three days before Thanksgiving, and there are more on the way now that were meant for this trade. It is hard to get people who make shipments for the holidays to send them early enough. If that poultry had been here in time, we could have sold it all, but now it will have to be held over for several days." Trade after a holiday is usually dull, but little being done during the remainder of the week following Thanksgiving. The market was badly upset for several days on account of the large quantity of left-over stock, the heavy receipts and mild weather. Prices dropped three to five cents per pound, and considerable quantities had to be put into storage, although so poor as to be scarcely worth holding. There is a general complaint that poultry is thin this year, as the prices of grain have been too high to feed heavily. Of course, the transportation companies are often responsible for the delay of shipments on account of the extra work at such times. The safer plan in shipping is to make allowances for such things and send a little earlier than seems necessary rather than run the risk of being too late. Those who have poultry for the Christmas trade can make money for themselves and accommodate their selling agents by bearing this in mind. W. W. H.

Apple-Eating Birds.

In the issue of November 16, page 770, H. S. M. makes serious charges against certain members of the Apple Consumers' League, and asks the League for its aid in getting rid of the objectionable members, even to the extent of adopting the southern policy of shot-gun tactics. I am strongly inclined to believe that H. S. M. has not been a very close observer of the habits of the woodpecker family, and more especially of the menu from which they choose their daily diet, else he would not ask aid in a movement looking towards their extermination. I have seen a member of the family work for 10 minutes to get at the larvæ of some insect in the wood of a maple tree, when the tentless caterpillar fairly covered the outside of it. As a family the woodpeckers are most diligent and persistent workers, and almost invariably in the interests of fruit growers and horticulturists. Their bill of fare is largely made up of foods which are beyond the reach of other species, as nature has given to them special implements (a chisel-like or wedge-shaped bill and elongated tongue with barbs near the end) with which they can supply their daily needs. In August I saw a Downy woodpecker alight on an apple and peck into it. When he had flown away I secured the apple, and on opening it, found evidences of the recent work of the larvæ of the Codling moth. It might be possible that those members of the A. C. L. whom H. S. M. desires to have expelled or exterminated are, after all, the most useful members of the organization, and that their work, of which he so bitterly complains, was protective, rather than destructive, and at that late day, they were trying to make amends for what he failed to do earlier in the season. They dig insects and their larvæ out of trees, and contrary to prevalent impressions, their boring does not seem to injure fruit trees. The numbers of noxious insects these birds destroy is simply incalculable, and what little fruit some of them steal is not to be mentioned in the same connection.

New York. A. R. E.

Oleo and Milk Rogues.

The following parties have received a small slice of justice at the hands of the State Department of Agriculture:

MILK.

Warwick Valley Milk Association, 1279 Broadway, $75 and costs.

Ed. D. Pierson, 325 E. 120th St., $100 and costs.

Ed. Shoemaker, 316 Willis Ave., New York City, $50 and costs.

Benjamin Wacht, 53 Moore St., Brooklyn, $50 and costs.

Jos. A. Rudoif, 513 42nd St., New York City, $100 and costs.

Wm. Jordan, 207 East 36th St., New York City, $50 and costs.

Manhattan Dairy Co., 1315 Amsterdam Ave., New York City, $100 and costs.

Wm. Schmidt, 138 7th St., New York City, $90 and costs.

Henry Schneider, 402 East 12th St., New York City, $100 and costs.

Mutual Milk & Cream Co., 322 East 103d St., $250 and costs.

OLEOMARGARINE.

Gustave Strunck, 359 First Ave., New York City, $25 and costs.

Michael O'Brien, Jersey City, (wagon), $250.

Ernest Lentz, 146 Fulton St., Brooklyn, $75 and costs.

Otto Ling, 116 Myrtle Ave., Brooklyn, $50.

Henry Dunker, 3009 Third Ave., New York City, $100 and costs.

Grandpa

Everybody's proud of this sort of Grandpa, and he's proud of himself; proud of his clear brain and active body. There are other kinds of grandparents that we can't be proud of. Weak of body and feeble of mind, we can only pity them. They no more live; they only exist. What makes the difference between these two classes of old men? A sound stomach and a plentiful supply of pure, rich blood. Dr. Pierce's Golden Medical Discovery strengthens the stomach, purifies the blood, and increases the activity of the blood-making glands. It won't make old men young, but it will enable old men to assimilate the food they eat, and so strengthen them for a life of reasonable exertion.

"I suffered for six years with constipation and indigestion, during which time I employed several physicians, but they could not reach my case," writes Mr. G. Popplewell, of Eureka Springs, Carroll Co., Ark. "I felt that there was no help for me; could not retain food on my stomach; had vertigo and would fall helpless to the floor. Two years ago I commenced taking Dr. Pierce's Golden Medical Discovery and little 'Pellets,' and improved from the start. After taking twelve bottles of the 'Discovery' I was able to do light work, and have been improving ever since. I am now in good health for one of my age—60 years. I owe it all to Dr. Pierce's medicines."

Old people often need a laxative medicine. The best for them is Dr. Pierce's Pleasant Pellets.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal". See our guarantee 8th page.

A CURE FOR ASTHMA.

Asthma sufferers need no longer leave home and business in order to be cured. Nature has produced a vegetable remedy that will permanently cure Asthma and all diseases of the lungs and bronchial tubes. Having tested its wonderful curative powers in thousands of cases (with a record of 90 per cent permanently cured) and desiring to relieve human suffering, I will send free of charge to all sufferers from Asthma, Consumption, Catarrh, Bronchitis and nervous diseases, this recipe in German, French or English, with full directions for preparing and using. Sent by mail. Address with stamp, naming this paper, W. A. Noyes, 847 Powers Block, Rochester, N. Y.

BRAND NEW STEEL ROOFING

Bought at Receivers' Sale. Sheets either flat, corrugated or "V" crimped. No tools except a hatchet or hammer is needed to lay the roofing. We furnish free with each order enough paint to cover and nails to lay. Price per square, $1.75

A square means 100 square ft. Write for Free Catalogue No. 67 on General Merchandise. Chicago House Wrecking Co., West 35th and Iron Sts., Chicago, Ill.

All Hands Need It

when all known resources fail, no matter how deep-seated, complex, chronic or acute the case, its penetrating, absorptive, antiseptic power is unfailing.

Veterinary Pixine

brings quick relief. Scratches, Grease Heel, Mud Fever (that defied treatment for years); Abscesses, Stinging Sores, Hoof Rot, Mange, all Inflammatory Swellings, Old Sores and Skin Disease

Absolutely Cured.

Heals without Scab. Stimulates New Growth of Hair—natural color. It penetrates, soothes and heals. Money back if it heals.

2 oz., 25c.; 8 oz., 50c.; 5-lb. pkge., $4.

At all druggists and dealers or sent prepaid.

TROY CHEMICAL CO., TROY, N. Y.

SPECIAL OFFER

High-Grade Watches.

WALTHAM AND ELGIN ONLY.

Orders will be filled by return mail for Christmas and New Year's presents.

We now offer some extra fine watches. Every watch offered is stem wind and set and has all improvements.

The "P. S. Bartlett" Waltham and the "G. M. Wheeler" Elgin are as good watch works for men as we have ever seen.

Men's Size Watches.

"P. S. BARTLETT" OR "G. M. WHEELER."

We give you your choice. They are full 17-jeweled watches. They are adjusted by experts and are first-class in every respect. They come cased at following prices, including free safe delivery:

In solid ore-silver case, open face	$12.25
In sterling silver case, open face	13.88
In sterling silver case, 3 oz. case, open face or hunting	16.15
In 25-year gold filled case, open face	18.56
In 25-year gold filled case, hunting	21.37

No. 7. Ladies' Waltham or Elgin Watch.

14-K. GOLD-FILLED CASE.

FULL 15-JEWELED WORKS.

No. 7 is a lady's full 15-jeweled hunting case watch. The works Waltham or Elgin. The case is 14-Kt. gold filled, guaranteed to 25 years. Price delivered in good running order, $14.50.

All watches are fully guaranteed. Money returned if not satisfied. The watches are sold only to subscribers. You can get any watch free by getting up a club of subscriptions.

Live Stock and Dairy

HOLSTEIN BREEDERS TALK.

Are Holstein breeders generally satisfied with the results in the Model Dairy at Buffalo? Should the value of the skim-milk be added to record of each cow, and if so, why?

Our opinion is that a cow should be credited with all that she produces, and hence we think the Holsteins would have made a better showing in the Model Dairy, for they gave much more milk, and the skim-milk, fed to Holstein calves or even to pigs, would have been quite an amount in this case.

East Claridon, O. KNAPP & PIERCE.

I do not find the Holstein people dissatisfied with the results or the system and management of the Model Dairy test, as they had prizes giving credit for total products, and which you will note were won by Holsteins, which shows that the Holsteins are the most profitable for farmers to keep, as they not only made the most profit in total products, but also made largest net gain in weight. The only objection which I can make, and which is made by the majority of Holstein breeders, is the manner in which those results were published, as the column for total products was always omitted. You will note that the prize for net gain in total solids was won by Holsteins by a net profit of $26.44 and the prize for net profit in total solids and gain in live weight was also won by Holsteins by a net profit of $31.63. Prizes for net profit in butter fat were won by Guernseys by a net profit of $4.66, and prizes for net profit in churned butter were also won by the Guernseys at a net profit of $5.86. This not only shows that Holsteins are the most valuable "all-purpose cows," but also that Holsteins are the only "dual-purpose cows." W. M. BENNINGER.

Benningers, Pa.

In simple justice, as long as every pound of food the cow consumes is charged to her, why should she not be credited with every cent's worth of her product which has a distinct market value? Skim-milk is selling in the Cleveland market at 55 and 60 cents per 10-gallon can. There is a demand upon Dellhurst Farm for more than they can produce at 40 cents delivered on the cars in Cleveland; it costs us 15 cents per can to deliver. We think the only fair way to make a comparison of the business value, without prejudice as to the breed of cattle, is to charge them with all they consume and credit them with every cent they produce. The test of the value of butter fat is what it can be sold for on the market, and skim-milk should be judged on the same basis. Perhaps this is putting my favorite breed, the noble black and white, on too cold a business basis; but it seems to me eventually they must stand or fall accordingly. H. B. VAN CLEVE.

Mentor, O.

MARKET VALUE OF FEEDING STUFFS.

How do we determine the value of the component parts of a ration (separately)? What is the market value of the protein, carbohydrates and fat as shown in the table in THE R. N.-Y. of November 2? If I knew the price per pound on the various elements, I could use the feeding tables more intelligently. G. H. T.

Bloomington, Ind.

There is no market value in the ordinary sense, placed on the protein in a feeding material, or carbohydrates and fat. Chemists, however, on the basis of numerous feeding trials and chemical analyses, regard the digestible protein in one feeding stuff to be of the same value pound for pound with that in another feeding stuff. In the same way, the carbohydrates in one feed have the same food value that those in some other feed have. There is no market value, however, for a pound of protein, although those foods richest in protein are nearly always the highest priced. The market value of a food is largely based on its abundance. For example, when bran is very abundant, and other feeding stuffs quite common, bran will be cheap. I have bought it in Lafayette, Ind., for as low as $8 a ton. Now, however, it is scarce, and is $20 a ton. Further, the price of bran seems to have no essential relationship to a large or small wheat crop. Several experiment stations, notably those of Connecticut, Vermont and Wisconsin, have endeavored to place a money value on the nutrients in concentrated feeding stuffs, but thus far no satisfactory results have come from this. As Henry says in his work on "Feeds and Feeding": "At present it is impossible to state the value of one feeding stuff in terms of another, from calculations based upon the nutrients contained in each." We do know, however, that if 1,000 pounds of cornmeal contain 80 pounds of digestible protein for an animal, and 1,000 pounds of gluten meal 250 pounds, then the latter contains three times the feeding value of the former so far as protein goes. In such a case, where there is so much difference, the one having the least protein contains the most carbohydrates, so it is necessary to consider the other nutrients besides protein, if buying in the market. It, however, is quite well understood that those foods containing the most protein have their greatest value for producing lean meat or muscle, or milk, or supplying work, while the carbohydrates and fat have their chief values in fattening. Protein foods are also of great value for growing animals that are not to be fattened, or for breeding animals. But as I have said before, we have no satisfactory money standard to establish uniform food values by.

The feeding value of foods was originally determined through feeding experiments on animals. Samples of the foods used were first analyzed by the chemist, and later the manures and excretion carefully collected and analyzed. The gains in weight or in animal product showed the amounts of digestible nutrients in the food, after deducting the losses in excretion from the original food analyzed. From such analyses and experiments our feeding tables have been prepared. C. S. PLUMB.

The Winter Lamb.

Following is an interview with Clark Allis, who has made a success of this business:

How long have you been raising early lambs?

I always liked sheep, and have been at it since I was a boy 10 years old. Of course I have tried many breeds. From Henry Stewart's book I got the idea that the Tunis would be good for Spring lambs, as there was no difficulty in getting them to breed early, and I have found them by far the best of any breed tried.

How do they compare with Shropshires?

The Tunis is an ordinary farm sheep, and has not been fitted for exhibition purposes so thoroughly. It is in raising early lambs that they show their true worth. We killed eight lambs for New York Thanksgiving trade. Six were Shropshires and two Tunis grades. The Tunis had as much fat on one caul and kidney as two of the Shropshires. All of the lambs had been on good pasture, and only one, a Shropshire, had had any grain.

How about Dorsets?

I used them for several years, but a comparative test with the Tunis showed that the latter brought from $1.50 to $2 more per head. I now have about 60 Tunis, the fattest lambs I ever saw together, and neither they nor the ewes have had any grain. I never saw a Tunis grade that was not fat on his kidneys, and that is what sells a Spring lamb.

How are they for wool?

Tunis wool brings the highest price of any I produce.

How do they compare in live and dressed weight with others?

In lambs of the same live weight a Tunis will dress from two to four, and, in case of fine wool lambs, six to eight pounds of the highest quality of mutton more than any other breed I have tested.

Notes from Milk Producers.

Skimming station paid producers for the month of October 90 cents to $1 per 100 pounds, station returning skim-milk to producers. The milk shipping station paid 94 cents net per 40-quart can for October; November they pay $1.05. About 75 cans are handled daily by shipping stations. Our creamery has not been rebuilt. Oats held firm at 45 cents per bushel; yield very light and very inferior in quality. Corn, 60 cents per bushel; wheat bran, $21; wheat middlings, $22; gluten, $26; hay $8 to $10 per ton; stock generally in good condition. Cows are selling for $25 to $35; sheep, $2 to $3 per head; lambs, 3½ cents per pound; choice or extra, four cents per pound. Many farmers are selling their entire flock with the view of going into the dairy business. M. D. W.

Spencer, N. Y.

The milk from this locality is all shipped to New York and to the Borden Condensery at New Berlin. At our station at River Forks we have a contract with the Mutual Milk & Cream Co. of New York, for six months beginning October 1. The price for October, February and March is 2¼ cents per quart; for November and January, 2½ cents, and December, 2¾ cents. At present there are about 95 cans per day received and shipped. They pay monthly on or before the 10th of each month. Cows are in good condition and fodder plenty; some hay is being baled and shipped from this section. Feed of all kinds is very high; cornmeal, $26 per ton; hominy and gluten, $25; bran, $22. Farm hands are geting from $13 to $15 per month and board and washing. The farmers are wondering what the end will be.

Unadilla Forks, N. Y. H. P. C.

The milk business is conducted about the same as last reported. We are shipping from Stanton Station about 15 cans daily. The majority of this goes to Perth Amboy. The price received is $1.20 per 40-quart can (net to the shipper) for the six Winter months. The shipping station at Sunnyside is operated by James Wyckoff, who also operates a station at Clinton, the same shipping from 15 to 20 cans daily. The producers patrons of the shipping station receive New York Exchange price, less one-half cent per quart as station charges. Cows will go into Winter quarters in good condition generally. The price of feed is high; corn and oats feed, $1.35 per 100 pounds; bran, $20 per ton; shorts, $24; brewer's grains, 26 cents per 100, which makes the price of milk too low when compared with the price of feed. J. B. Anderson, one of our progressive dairymen, is laying the foundation for a new house on the top of the mountain to correspond with the round barn erected three years ago. The place is known as Rockland Farm. He has a herd of 30 grade Jerseys. W. A.

Stanton, N. J.

Anybody

can keep his horses free from all forms of **Lameness**, curbs, splints, contracted cord, thrush, grease heel, etc., by treating promptly with

Tuttle's Elixir.

Used internally it cures Colic, Distemper, Founder, Pneumonia, etc. **Used and endorsed by Adams Express Co.**

Dr. S. A. Tuttle.—Dear Sir:—I have used your Elixir on one of the worst spavins that I ever saw on a horse, and it entirely cured the lameness. I also used it for rheumatism in my family, with just as good a result, and will cheerfully recommend it to anyone in want of a liniment. O. B. GOVE, Waits River, Vt.

TUTTLE'S FAMILY ELIXIR cures rheumatism, sprains, bruises, etc. Kills pain instantly. Our 100-page book, "Veterinary Experience," **FREE.**

Dr. S. A. TUTTLE, 30 Beverly St., Boston, Mass.

Beware of so-called Elixirs—none genuine but Tuttle's.

Avoid all blisters; they offer only temporary relief if any.

Can You

do a little pleasant and profitable work for us in your own town? No experience necessary. We will explain just what you have to do. The work will be light, and we will arrange for the time you shall be able to give to it. We can give you work for all your time or just for your spare time. Write for full particulars. THE RURAL NEW-YORKER, NEW YORK.

Breeders' Directory

JERSEY BULL

Yearling—registered, from a great show cow; almost faultless, by a producing sire. Farmer's price. R. F. SHANNON, 907 Liberty St., Pittsburg, Pa.

123 HOLSTEINS all ages, for Sale DELLHURST FARMS, Mentor, Ohio.

FOR SALE—Thoroughbred HOLSTEIN-FRIESIAN CATTLE of the best families. Also, 30 high-bred Bulls at reasonable prices. Write the MAPLES STOCK FARM, Binghamton, N. Y., WM. ROOD, prop.

For Sale—PUREBRED HOLSTEIN-FRIESIANS from best families. Two registered bulls ready for service and bull calves. Also have purebred BERKSHIRE SWINE and SCOTCH COLLIE PUPS at low figures. Write for breeding and prices. W. W. CHENEY, Manlius, N. Y.

Jersey Bull—18 months; solid color. No further use. Good size; dam 14-lb cow; sire better; kind & fine; won 6 prizes. Cheap: write at once

Mammoth Bronze—No better; y'g toms, 20 lbs. Shine like metal fine; $6 pair

Prolific Swine—3 sows, farrowed 39 pigs. Pairs not akin. CHESHIRE. Send 2-c. stamp for illust'd catalogue. history, etc. C. E. CHAPMAN, Peruville, N. Y.

$23.75 for top Poland-China sow, bred for Spring. These are the mellow, easy keepers. $10 for Sept. pigs. K. HAWK, Mechanicsburg, Ohio

Reg. P. Chinas, Berkshires and C. Whites.

Choice Pigs, 8 weeks old, mated not akin. Bred Sows and Service Boars. POULTRY. Write for **hard times prices** and free circular. HAMILTON & CO., Rosenvick, Chester Co., Pa.

2000 FERRETS. First-class stock. Some Trained. New Price-list free. N. A. KNAPP, Rochester, Lorain Co., O.

ANGORA GOATS are handsome, hardy and profitable. Prize stock. Low prices. Large cir. E. W. Cole & Co., Kenton, O

Light Brahmas and White Plymouth Rocks. Fine birds of each fit to show. Thirty years a shipper of Fine Poultry. J. A. Roberts, Malvern, Pa

For Sale—300 Choice Barred and Buff P Rocks; also White and Silver Wyandottes. Price reasonable. DR. S. C. MOYER, Lansdale, Pa.

BARGAINS—200 cockerels at $1 each. Buff Wyan; Buff Rocks; S. C. White Leghorns; R. C. Brown Leghorns. Everyone a thoroughbred. A. B. KATKAMIER, Macedon, N. Y.

Cockerels—Choice W. Wyan., P. Rocks, Brahmas, Cochins, Leghorns, from prize-winning stock. 23 varieties of land and water fowls. Satisfaction guaranteed. Big catalogue free. Pine Tree Farm, Box T, Jamesburg, N. J.

MAPES' VENTILATING DRUM *Utilizes Animal Heat.* Heat your hen roost with absolutely no expense for fuel. Warranted to secure a constant circulation of pure air, and a temperature above 40 degrees in zero weather. Full directions with each drum. Price, $3.50. MAPES' VENTILATING CO., Middletown, N. Y., Box 205.

HOMING PIGEONS—Twenty-five pair, guaranteed. Stock at $1 per pair. S. B. ARTHURS, Brookville, Pa.

Collie Pups—Spayed Females. Circulars. SILAS DECKER, South Montrose, Pa.

Sharples "Tubular" Dairy Separators.

Greatest Step Ever Made in Advanced Cream Separator Construction.

If cost more, are worth double, for they produce enough more butter than the best competing separator to pay fully 6 per cent interest on whole first cost of machine.

We Absolutely Warrant It and Give Free Trial to Prove It.

Also very light running, a 600 lb. machine turning easier than other 300 lb machines. No disks to bother with and get out of order. No complications.

If you want to know about all different separators, send us for a copy of "The Separator," containing an expert opinion on them, together with free Catalog No. 153.

Sharples Co., Chicago, Ill. P. M. Sharples, West Chester, Pa.

DAIRY AND FARM NOTES.

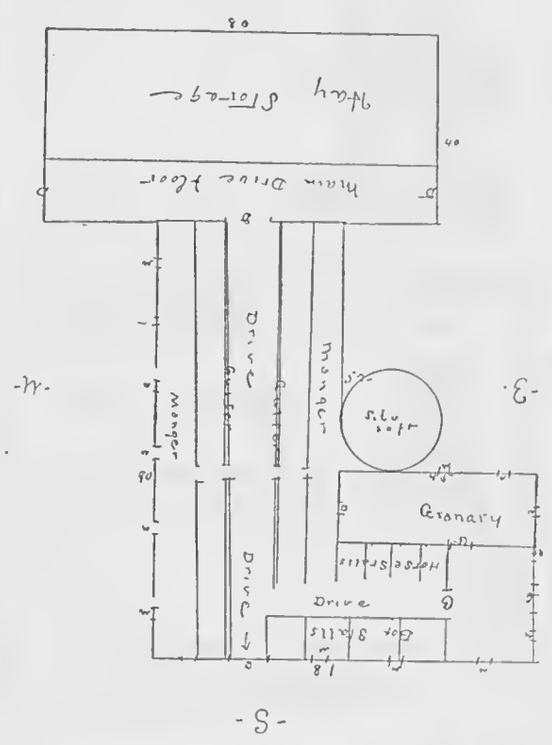
Building a Dairy Barn.

PART III.

COST AND CONVENIENCE.—It is always useless to write about impossibilities when discussing questions from a business standpoint. Value comes to us not from what we know, but from its execution. In talking about barns I hope the impression may not remain that buildings must be expensive to be valuable. At the same time, remember that a good job cannot be done cheaply. I write for those like myself, who have moderate means. A lack of working capital is our greatest agricultural hindrance today. I have some ideas upon associated farming which in a way are being carried out on Union Home Farms, that I hope some time to put into print, that bear directly upon the point in question. Some of the most ill-planned and unsatisfactory barn construction, particularly the stabling, has been upon farms owned by wealthy men. Return for a moment to the idea given on page 798 relative to disease. The question of temperature, as a rule, takes precedence over moisture, or, more clearly stated, farmers seem to think that an animal is under greater strain and discomfort out in the zero day even though the atmosphere is quite free from moisture, than upon a day 20 degrees warmer but in an atmosphere full to saturation. In my judgment this premise is wrong, and I am not sure but it may be a cause of frequent cold and subsequent lung trouble and tuberculosis.

DAMPNESS AND DISCOMFORT.—I have in mind the New Jersey cows one year ago during November and the first half of December, as seen from carriage and railroad out of doors from early morn till close of day, and frequently all night unhoused, simply because it was not cold. Yet their attitude evidenced the fact that they were not comfortable; the cause, damp air. Arriving home about December 15 I found our section in the throes of midwinter weather and zero temperatures. At this same time our own cows were far more comfortable, housed in light, dry, warm stables, and anyone seeing the marked contrast in weather conditions would at first hardly believe my story, but I know I am right. Now this cool damp air is much the same, whether found in the outdoor air of the Middle Atlantic coast and adjacent regions, or in a cow stable anywhere, and our first effort should be to get rid of it. In my experience it has been difficult to build all parts equally satisfactory. There must be more or less subordination of the working parts, with some one feature leading. The leader on a dairy farm should always be the stable, for it is in use every day, and our machinery, which is locked up in the vital force found there, if not in working condition develops friction and consequent loss. Hay storage, silos, granary and all appurtenances connected with the building must take second place. Since silage has come to be a dependent stock food the immense hay storage of former years has not been needed, and again early cutting of hay reduces space required. Not much more than half the space is required for storing a given amount of food when cut before July 1 in our latitude as delayed three or four weeks.

LABOR-SAVING DESIGNS.—This brings us to form. Shall the building be round, square or rectangular, with greater length than breadth? In some measure these questions are answerable only by the builder, who should first study his needs and limitations. I have no experience whatever with the round barn, and am therefore not qualified to discuss its merits or demerits. I have always studied to save steps in daily work about the barn, because what is performed daily, although the saving seems small at the time, may in the aggregate far outweigh some apparent extra cost in crop handling which comes but once a year. The diagram of the working parts of barn built in 1900, Fig. 382, may serve us best. First notice points of compass, giving a southern and western stable exposure, admitting light and direct sun's rays as previously mentioned. It will be observed that the working parts are all upon the ground, quite contrary to the accepted designs for a strictly modern barn. I worked out this plan, however, after using for 12 years a two-story barn possessing equivalent or slightly greater capacity, and the use of the two barns under quite similar demands rather favors the more recent plan. The only added expense in first construction is the roofing, but this is offset by the very cheap frame, and general construction of the hay storage. Much of the labor is thus saved which we find involved in a double floor. This barn is not without storage capacity over the stable—used mainly for straw after thrashing and hay for horses. It was first planned to build the stable without floor above, bringing the eaves low and having really a warm shed. A



PLAN OF DAIRY BARN. FIG. 382.

very serious objection appeared, and the plan was not matured.

HIGH CEILINGS.—The ancient cow stable was not intended for a tall man, six feet being the usual space between floor and upper joists. The modern stable is too often built with the other extreme, 12 to 16 feet in the clear, and the greater the effort to build wisely and expensively the higher the ceiling. I would like to ask the reader whether he ever went into a stable of this description and met that warm comfortable feeling at the door that one should meet on a wintry day, or, in fact, any time? In my observation these stables may have been clean and sanitary from every other point of view, but here we find throat and bronchial troubles, and I could cite several cases of tuberculosis that developed in these cool, damp, high-ceiling barns. I could not see any way out of the shed system and not have this same objectionable feature. In them it becomes an impossibility to maintain a relatively high temperature without artificial heat. A good, well-fed cow should lie down at least half of the time. She is within three feet of the floor, the coolest place in the room, having no use for the warmer air 12 feet above. I concluded that nine feet was a happy medium, considering both appearance and utility; for utility alone eight feet is sufficient, and a small stable holding 10 or 15 cows will not have a low appearance, but a room 100 or 150 feet long with a suitable width will appear out of proportion with that height. A safe working principle always is, first utility and secondly appearance, but general appearance should always be kept in view. H. E. COOK.

Bone-Making Food Needed.

I have never fed ground bone to my cows. I do not believe it could be necessary, from the fact of my soil being on limestone hills and clay. The hay, grass and fodder thus grown carries sufficient lime and bone material. Horses raised on this soil have very good feet and bone. It might appear to be a needful material to supply in the ration of growing young stock if fed heavily on corn and cornstalks and Timothy hay. To a full-grown, mature cow requiring but very little to maintain bone growth I would expect but little benefit from feeding ground bone. The hen requires it because of the lime and bone material in her production. The hog gets but very little bone material from his ration of corn and water. The hog on pasture does not require the bone meal as much as one kept on corn ration. I can see where a cow supporting an embryo calf, and fed largely on corn and grasses and fodder grown on very low wet land might produce a larger-boned calf by being well supplied in her feed with some bone meal. It is not the heavy ration that injures the dairy cow as much as it is the unbalanced ration, and to balance the ration perfectly or nearly so for a working dairy cow the whole year through in our climate should be very carefully studied and her condition observed.

Oxfordville, Wis. H. C. TAYLOR.

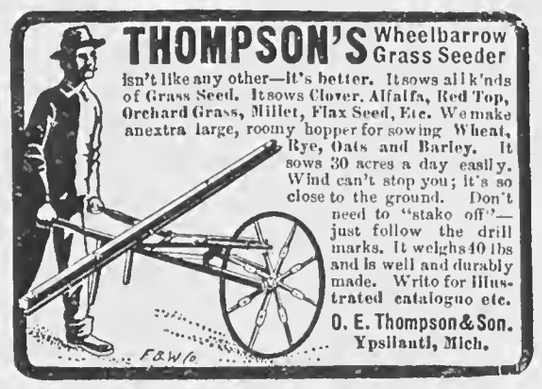
10 Weeks for 10 Cents. You have several neighbors and friends who need THE R. N.-Y. We are going to help you to see that they get acquainted with it. For our part we will send the paper to them now 10 weeks for 10 cents—a cent a week. We ask you to call their attention to this offer. Perhaps you can get up a club. The 23 largest clubs will each get a cash premium January 1 Will you be one of them?

YOUR FOOTSTEPS

By the depth of his footstep in the earth the Indians tell the weight of a man. Do you tread shallow or deep? Perhaps you would like to weigh more? If you are below weight and find that ordinary food does not build you up try Scott's Emulsion.

It is not a drug but a food that time has shown to have a real value in such cases as yours.

We'll send you a little to try, if you like.
SCOTT & BOWNE, 409 Pearl street, New York.



THOMPSON'S Wheelbarrow Grass Seeder
isn't like any other—it's better. Itsows all k'nds of Grass Seed. Itsows Clover, Alfalfa, Red Top, Orchard Grass, Millet, Flax Seed, Etc. We make anextra large, roomy hopper for sowing Wheat, Rye, Oats and Barley. It sows 30 acres a day easily. Wind can't stop you; it's so close to the ground. Don't need to "stake off"—just follow the drill marks. It weighs 40 lbs and is well and durably made. Write for illustrated catalogue etc.

MORE LYING AS TO PARIS SEPARATOR AWARDS

Cornered and beaten in its misrepresentation as to the Buffalo separator awards, one of our desperate would-be competitors now reverts to its lying misrepresentation as to the Paris Exposition awards in 1900.

The following official statements speak for themselves:

STOCKHOLM, December 5, 1900.

By request the undersigned hereby testifies that Aktiebolaget Separator [the European De Laval organization] was awarded the GRAND PRIX on its exhibition of cream separators by the International Jury.

(Signed) HENNING ELMQUIST,
Secretary Royal Paris Committee.

(Cablegram) STOCKHOLM, April 2, 1901.

We hereby positively certify that Aktiebolaget Separator of Stockholm [the De Laval European organization] were awarded the GRAND PRIX for their Alpha-De Laval separators at last year's Paris Exposition.

(Signed) THE SWEDISH PARIS COMMITTEE.
(Signature legalized through the Anglo-American Telegraph Co.)

U. S. CONSULATE GENERAL,
STOCKHOLM, Sweden.

From evidence this day furnished me I am able to certify that the Separator Company, Ltd. [Aktiebolaget Separator] of this city did receive the "GRAND PRIX" for their Alpha-De Laval separators at the Paris Exposition, in the year 1900, as per announcement in the "Journal Officiel", Paris, of Aug. 18th, 1900, this day presented at this office.

In witness whereof I have hereunder set my hand and affixed my seal of office on this 17th day of April, 1901.

(Signed) CARL P. GERELL,
[OFFICIAL SEAL] U. S. Consul General.

Any assertion by anyone and however made that the De Laval separators did not receive the Grand Prize at Paris is simply and wholly a vicious lie, and is particularly aggravating in the case of the concern now insinuating such a thing because its manager was in Paris at the time the separator awards were originally announced and begged and pleaded through the American Government representatives that its own third grade award (on "U. S." cream separators) be changed to a second grade one, which out of special courtesy the French authorities finally conceded.

A QUARTER CENTURY WITH FERTILIZERS

THEY HAVE KEPT THE FARM PRODUCTIVE.

Must Use Enough of Them.

I see that on page 760 you call for the experience of those who have used commercial fertilizers to maintain the fertility of land in farming. I have used fertilizers as the chief source of plant food in my farming for 25 years, and have used most of the time from 10 to 20 tons per year. As the result of my experience I should have no hesitation in undertaking to grow crops and maintain soil fertility with fertilizers under almost any conditions where I should be willing to attempt the same results with stable manure. To secure success with fertilizers one must inform himself as to the qualities of fertilizers, and select such as will do the work he desires. If properly selected and used, I think the results are as lasting with fertilizers as with manure, and I have tested them side by side for the purpose of observation. When fertilizers are used sufficient provision must be made to maintain the supply of humus in the soil, and also to correct soil acidity, which is more likely to occur with fertilizers than with stable manure. This is especially true of fertilizers as they have been compounded heretofore. It may be possible so to compound them as to obviate their tendency to produce soil acidity. In the present light on subject I have concluded to discard the use of forms of potash containing chlorine, hoping thus to attain that result. I think many cases of supposed soil exhaustion by the use of commercial fertilizers are only soil acidity. My own experience leads me to this conclusion. After I had used fertilizers several years I found the results were not as good as at first. Neither would crops grow as well when stable manure was used. From statements about liming land to correct soil acidity, given out by the agricultural stations (more especially the Rhode Island Station) I was led to test my soil with litmus paper for acidity. I found the soil was quite sour. I then sought to find the least expensive way to supply lime for the cure. I live where lime cannot be obtained cheaply; the best I could do was about $9 per ton for caustic lime at the railroad station. If I bought air-slaked lime, the increase of weight for actual lime, and the consequent increased cost of freight, made the cost of actual lime just about the same. I found, upon investigation, that wood ashes were about one-third lime, and, allowing for the value of potash and phosphoric acid in the ashes, and considering also that the ashes are already in good condition for spreading, I decided to use Canada ashes. I applied about one ton per acre with good results, and the next year I repeated the dose.

The result is, my land, some of which never had as much as one good dressing of manure in the 18 years I have cultivated it, now grows fine crops of hay. One lot produced three tons per acre at first cutting, and one ton per acre of rowen this year, which has been very favorable for hay in this vicinity. I use each year in Spring on grass a dressing of fertilizer costing from $5 to $7 per acre. One great reason for the belief that the use of commercial fertilizers produces exhaustion of the soil is the fact that users do not generally apply *enough*. Farmers who do not think of applying less than five cords of manure per acre for corn, and spread most of it broadcast, will expect 400 to 600 pounds of fertilizer per acre dropped in the hill to produce equally good results without exhausting the soil. If they should rot down the manure to make it fine and quickly available to the crop, and then try to grow corn by using only a small shovelful to each hill, they would find soil exhaustion approaching just as rapidly as by the use of 400 to 600 pounds of fertilizer per acre. When using fertilizer for corn I try to get one that will yield up its plant food gradually throughout the growing season, and apply 1,000 to 1,500 pounds broadcast; then use a small quantity of some more quickly-acting fertilizer in the hill. Such an application will be likely to bring a good crop of corn and leave the soil improved instead of depleted. For potatoes I use a more active fertilizer, 1,200 to 1,800 pounds per acre, and apply in the drill. Potatoes have only a short growing season, and need their food near by and ready for use. So in all cases, the farmer who aims to get best results must consider the needs of his crops and select the fertilizers to supply those needs, and make the supply *abundant*. I formerly kept 12 to 15 cows and three horses, but a few years ago I sold all my cows but one, and now rely almost entirely upon fertilizers to keep up the fertility of the farm. My reason for selling the cows was inability to attend to the dairy, and also to the fruit growing, which I now make my leading farm crop. I still cut as much hay as ever, but sell it. This present year I cut about 55 tons. I will recapitulate the points which I consider necessary to secure success with fertilizers:

Select such fertilizers as will supply the needs of the crops, and use them *abundantly*, and mainly broadcast. Watch for acidity of soil, and correct it by applying lime in some form. Keep the land covered with some crop *all* the time, Summer and Winter, which will go far to keep up the supply of humus, but if humus becomes deficient plow in a crop of some kind, preferably some legume.

M. MORSE.

Massachusetts.

R. N.-Y.—Mr. Morse gives a very clear statement of the method of farming that is followed by many eastern farmers. We do not consider that further argument is needed to demonstrate the *possibilities* of fertilizer farming. Still, it must be admitted that this system is a matter of locality, convenience or inclination. A younger man or one naturally inclined to stock raising might do better with cows, sheep or hogs — obtaining his supplies of plant food from manure. That is a matter which each farmer must settle for himself. The yearly profit on these fertilizer farms will probably average higher than that from farms employing equal capital in stock raising or general farming. That is our conviction after going over many farm figures carefully. If a man decides to use chemicals as his chief source of plant food he may well keep in mind the points made by Mr. Morse. Only high grade chemicals should be used and *enough* of them must be applied. The supply of humus in the soil must be kept up and this can usually be done by means of "catch crops," or crops grown between two money crops. The tendency of this sort of farming is to sour the land and lime or ashes should be used at intervals. Mr. Morse finds wood ashes best for his locality but this may not be true in all cases.

LOAFING AT THE BRICK BAKE OVEN. FIG. 383. SEE PAGE 858.

SEEST thou the man with the chip on his shoulder? Let him carry it. You will probably hurt your hand if you try to knock it off.

FEEDING HORSES ON WHEAT BRAN.

Is It a Dangerous Food?

We recently received the following letter:

I feel impelled to write to you about the horse feed question. I should feel guilty if I did not, knowing and seeing what I do. I should advise against feeding bran, as I have seen a number of horses die from the effects of it, and consider it very dangerous to feed it in much quantity, as it wears the intestines thin, and when inflammation sets in they burst easily. I think I feed my horses as cheaply as anyone can on bran and meal. I feed four quarts of corn and four quarts of oats to a large team, three quarts corn and three quarts oats to a 2,200 pound team. Cost for four horses, 57 cents a day. Cost on the average, 14½ cents a day. Our horses do about six or seven hours' work a day, generally very hard, as I pull a heavy load or else use a sulky plow in heavy sod. I have a friend who for two years has kept three horses weighing about 1,200 pounds apiece. His method is this: He feeds at noon four quarts of oats, at morning and night he feeds two quarts of whole corn soaked in scalding water for 12 hours. His horses look as well as any I ever saw, and work exceedingly hard. I consider this better than taking the risk of killing some of my horses, which would be certain with bran or cornmeal. I feed 12 pounds hay, three pounds in morning, one at noon, and eight at night. H. J. B.

Marion, Conn.

This was so contrary to our own experience that we wrote H. J. B. asking him for further facts. He then wrote as follows:

Three years ago I lost a horse from the use of bran. At that time I had a middle-aged New Yorker working for me who had had a great deal of experience around the country. He said he knew of a good many cases of it. Since that time I have been on the outlook for cases of this kind, as we do most of the doctoring of farm animals about here, and also conduct a bone yard or skinnery. I have had a good chance to observe such things. Since my horse died I have skinned and opened four horses which died of colic, all but one from the effects of bran. We have also had two very bad cases caused from it. I also notice that a large number of horse books advise against the use of bran as a regular food for horses; also against the use of bran of any kind.

We have also consulted some of the best horsemen in the country:

What a Veterinarian Said.

Bran is a perfectly wholesome, nutritious and easily digested food for horses, provided it be clean. If evil effects have followed the feeding of bran, it must be because the bran is heated or because it is contaminated with some foreign substance. A warm bran mash is prescribed by veterinarians for horses that are ill and that need to be tempted by a specially dainty food, and to be nourished by food that is exceptionally soothing to the digestive tract and easy of digestion. To my knowledge no harm and much good has resulted from this product. The only objection to the heavy feeding of bran to horses is that it is likely to cause looseness of the bowels. One can readily tell by experimenting how much bran a horse will stand. The laxative effect of bran is more noticeable on horses that are working than on horses that are resting in the stable. It is well to remember that the diet of the working horse should contain a large quantity of carbonaceous material, and that bran is altogether too rich in proteids to be used as a large constituent of the diet of the horse.

Pennsylvania. LEONARD PEARSON.

A Horse Trainer's Experience.

In regard to feeding horses bran, we always prefer putting in a quart of dry bran to about three quarts of oats for general feeding, or in about that proportion. The reason for this is, that the animal masticates the oats better and eats more slowly, and we believe it wholesomer than the four quarts of oats alone, and get better results. In feeding weanlings, the hardest season to make the little fellows grow is through the cold weather. We boil the oats twice a day for them, and while they are hot we put in about one-third Winter wheat bran, thoroughly mixing and then let it stand about an hour before feeding. In our opinion this is one of the best feeds for growing young horses. You can winter a horse very nicely on bran and good hay, if he is not working hard. I do not believe it would give entire satisfaction to feed too much bran for regular road use, as it is liable to cause loosening of the bowels, and cold and inflammation set in. I think I have answered all your questions and given you Village Farm's experience. You well know we have been successful in breeding the best race horses that have been bred in this country, also the most successful farm in bringing out prize winners in the country. VILLAGE FARM,

East Aurora, N. Y. John Bradburn, Supt.

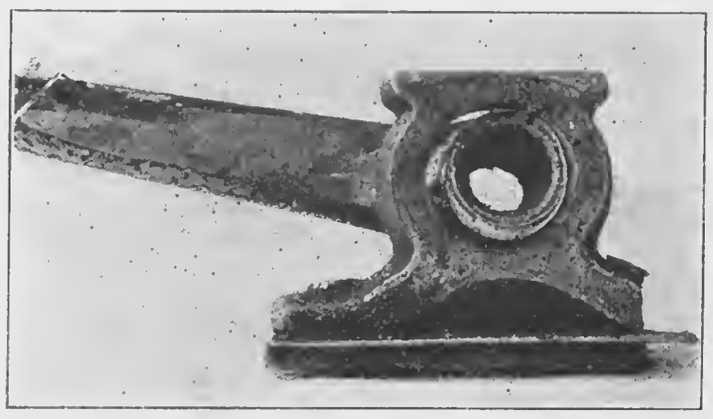
Bran Feeding Used for Roadsters.

We use bran for everything on the place, horses, cows, sheep, pigs and even chickens, and have done so since I was a boy. We feed our colts and brood mares half bran and half oats as a staple; with this about two tablespoonfuls of oil meal. No matter what ration of bran and oats we give this amount of oil meal. To older horses we feed less bran but like a little all the time. I have never had any bad results from its use, but have never fed over four quarts at a feed to a horse. I should think one might feed enough to scour a horse if the horse was a glutton, and possibly to any horse. I never tried to kill anything with it, or even tried to see how much they could stand. We would as soon think of getting along without any kind of feed as without the bran to any young growing animals. I think it is used on all stock farms. I would not expect to keep a work or driving horse on bran alone, for the reason that we do not believe there is enough fat and muscle in it. It is too bulky a feed to be a sustaining food for hard work. I do not handle as many horses as some, only sold 20 the past year; they were all light driving horses but one, he was a work horse. They all had more or less bran most of the time.

Vermont. C. A. CHAPMAN.

HINT TO BUYERS OF MOWING MACHINES.

The accompanying cut, Fig. 384, is from a photograph of the pitman connection of a mower. It is shown as an example of what may be expected to happen to any machine with the old-fashioned hook and eye pitman connection. Notice that both the sickle-head and the sickle-bar are broken. There is a quarter of an inch "play" in the connection, and this is what gave the pitman a chance to break the sickle. The agent for this machine said: "When the connection gets loose let the blacksmith heat up the end of the pitman and swell it out to fit the sickle-head by driving a big punch into the hole." Anyone who has run a mower knows that the only way to keep the pitman from knocking the sickle-head off or breaking the bar is to *keep* the connection tight. There should be on every mowing machine



PITMAN CONNECTION OF A MOWER. FIG. 384.

a ball and socket or some other easily-tightened joint at this place, so that all wear may be taken up as fast as it occurs. This point should not be overlooked by the purchaser of a mower. J. M. D.

Minnesota.

WORLD-WIDE WAYS OF FARMERS.

The well-known novelist, H. Rider Haggard, is a large farmer in Norfolk, England. In reading his published record of the year 1898, which he calls "A Farmer's Year," one meets with frank statements of the difficulties confronting the English agriculturist, which show how uniform is human nature the world over. Speaking of the encroachment of the sea on the sandy soil of the coast line, and of the inability of the land owners to combine to protect themselves, he says: "If we were Dutchmen the case would be different, but here in rural England, unless they are forced to it by act of Parliament, it is almost impossible to oblige people to combine to win future profits or ward off future dangers. Many farmers, to all appearance, would prefer individual failure to the achievement of a corporate victory." Will some philosopher please explain this common trait of the farmer mind the world over? If a remedy can be suggested and successfully applied, we shall not have such melancholy reading as this further extract from the same work—words that might have been written with equal truthfulness of our own Government at Washington: "In to-day's Times I see that a deputation waited upon Mr. Chaplin, the President of the Local Government Board, to urge, among other things, the prohibition of the artificial coloring of oleomargarine to resemble or imitate butter, and the prohibition of the mixing of oleomargarine and butter for sale. From Mr. Chaplin they got uncommonly cold comfort. He told them that he had 'heard the arguments of the other side,' and that if this fraudulent coloring—for the object of the coloring is fraud—were prohibited, it was urged that it would 'practically destroy the trade.' Is it not rather hard that such an answer should be given to an influential deputation by a minister supposed to sympathize with the distress of farmers?" Without doubt it was a little hard on the poor British farmer, but his case will be no easier until he overcomes his constitutional disinclination to organization. Let him go up to London and convince Mr. Chaplin that votes are behind him, and note the different reception that will be given him. Here in America the politician trades on what he believes to be the farmers' inability to combine to force their own interests, and so long as he is sure of that he will have no hesitation in flouting the farmer's demand for simple justice. F. W.

Massachusetts.

R. N.-Y.—We have always insisted that the only way for farmers to obtain what is due them is to show their voting power, so that the politicians will understand that they mean business. *Vote with the postage stamp!* That is the form of ballot to be used just now!

ALFALFA HAY FOR HORSES.

Alfalfa hay is an excellent roughage for heavily worked horses. It keeps them in good flesh, and Alfalfa-fed horses have glossy coats of hair such as are secured by feeding linseed meal. Teamsters who have given Alfalfa a trial for several months usually prefer it to other hay, while those who have fed it for a short time only strongly condemn it. When hard-working horses are first fed Alfalfa they sweat profusely, have loose bowels, and often urinate excessively. If the Alfalfa is properly fed these symptoms pass away in from three to six weeks, and the animals get in good condition and remain so. The writer recently saw a team of heavy Percheron mares that had been fed no other roughage than Alfalfa for 12 years, and were in nearly what breeders call show condition, although they had been fed little grain. In getting a horse on feed with Alfalfa hay not over two pounds should be fed the first day, and the horse should be given the same kind of hay as usual. The amount of Alfalfa fed should be slowly increased and the amount of roughage correspondingly decreased until at the end of three or four weeks the entire rough feed becomes Alfalfa. With a good grain ration 10 to 15 pounds of Alfalfa hay is sufficient for a day's ration for an average farm horse. When grain is high priced 18 to 20 pounds, and sometimes more, may be safely fed, but after 12 pounds per day is reached the increase in amount should be made very gradually, and a careful watch kept on the condition of the horse. If any of the symptoms mentioned as occurring when the horse is first fed Alfalfa appear the amount fed should immediately be reduced and kept down to 10 or 12 pounds until the animal gets in good condition, when an increase may again be slowly made.

Alfalfa makes the best feed for cattle, sheep and hogs when cut when only one-tenth of the plants have reached full bloom. It makes the best feed for horses when cut when in full bloom or even a little later. On large farms it is customary to start cutting when the Alfalfa is in proper condition for cattle, the work will not be completed until some of the Alfalfa is matured too much for cattle. That cut late is fed to horses. Alfalfa that has been over cured and thereby lost part of its leaves is better for horses than for cattle. The fourth and fifth cuttings of Alfalfa have a much greater percentage of leaves than the earlier cuttings, the hay is very laxative, and should not be fed to horses. Under ordinary western farm conditions either corn or Kaffir corn is the grain fed with Alfalfa. Equal parts of corn and oats makes a good grain feed. It is difficult to give the comparative values of prairie hay and Alfalfa hay. With a good grain ration a careful feeder will give a horse as many pounds of Alfalfa hay as he would prairie hay, but he will secure a condition of flesh, skin and hair that cannot be secured in feeding prairie hay without the addition of linseed meal. On the other hand, if grain is scarce or high the quantity fed may be limited and an increased amount of Alfalfa will take its place. The writer has seen a few teams this Fall that were doing ordinary farm work and were in good condition that had no other feed than Alfalfa hay, but the drivers knew how to work and care for their teams, and most teamsters would fail on Alfalfa alone. H. M. COTTRELL.

Kansas Ag'l College.

OILING WAGON TIRES.—After a wagon tire is loose oil will never tighten it. There is only one salvation when the tire gets loose, and that is to have it reset in the proper manner. We manufacture about 75,000 to 80,000 vehicles a year, and we seldom have any complaints of loose tires. The proper way to keep the tire from getting loose is to have the timber well seasoned, and then have the felloes immersed in hot oil before the tire goes on. Have the tire properly set, then the farmer should give his wagon or buggy wheels a coat of hot oil about twice a year, and he will not be troubled with loose tires and the felloes will last much longer, but as there are few concerns that adopt the course referred to, the farmer will use hot oil in oiling his felloes when the tires are not tight, and when the tires are tight, it will have a tendency to keep them so, and they are not so liable to get loose. J. M. STUDEBAKER.

TESTS OF CREAM SEPARATORS.

On 771 we printed a request from a Pennsylvania reader for some experiments to test the value of the so-called dilution cream separators. This is what he wanted done:

Use 400 pounds of milk, all mixed together. First, water 110 pounds, milk 100 in water separator. Second, 100 pounds milk run through a standard separator. Third, 100 pounds milk in Cooley-Stoddard or any standard creamer. Fourth, 100 pounds milk set in small pans. Fifth, after milk has been watered in No. 1, wait four hours or more, and then very slowly draw off about 100 pounds of milk and water, warm it and run the product through a De Laval, United States or other separator, and see how much butter can be extracted therefrom. Then, when these results are tabulated, we shall know *why*. Meantime, I will read and love THE R. N.-Y., water the milk and wonder whether I'm an old stupid or *why* watering is of "doubtful utility." E. D. R.

Pennsylvania.

The experiment station directors consider that this question has been fully settled—therefore they did not care to repeat their experiments. Prof. C. L. Beach, of the Connecticut Station, has made a careful experiment—the results of which are given below:

	Lbs. of 4 p. c. milk.	Lbs. fat in milk.	Lbs. skim-milk.	Test of skim-milk.	Lbs. of fat lost.	Per cent of fat lost.
Separator	100	4.	85	.025 p. c.	.02125	.62
Cooley creamer	100	4.	80	.29 p. c.	.232	5.8
Shallow-pan	100	4.	85	.55 p. c.	.4675	11.68
Aquatic separator	100	4.	165	.5 p. c.	.825	20.6

In addition to the skim-milk the separator milk includes 15 pounds bowl wash, causing further loss. In the aquatic separator 100 pounds warm water were added. The skim-milk from the aquatic separator was warmed up to 90 degrees and was then run through a centrifugal separator; 16.5 pounds, which were caught from the cream spout of the separator, tested 4.8 per cent fat, equivalent to .9 of a pound of butter. C. L. BEACH.

Conn. Exp. Station.

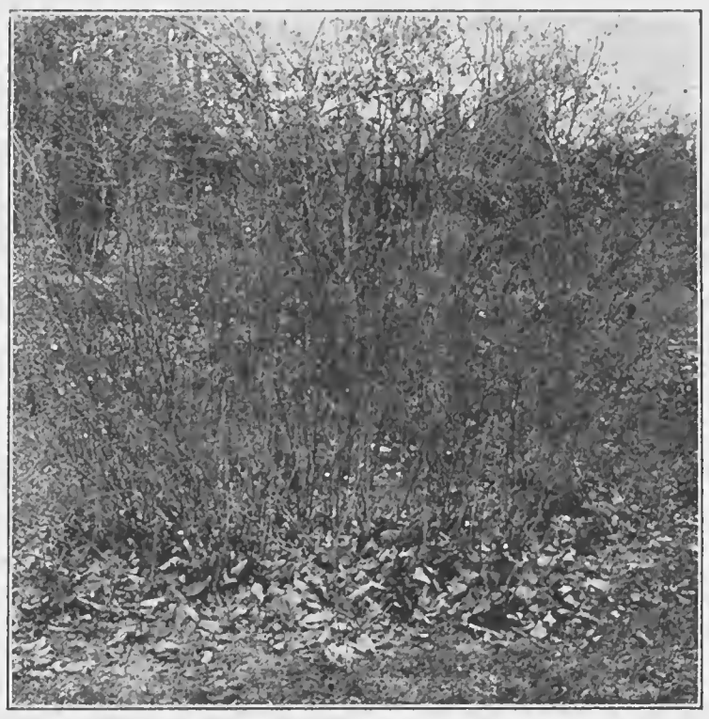
EXPERIENCE WITH ICEHOUSE AND ICE.

In almost all directions for building ice houses I read "provide proper drainage," which always puzzled me, for I could not imagine any need of it, for the ice, if properly put in, would not melt enough to run out at the bottom. It was several years before it dawned upon me that this advice was meant for the outside instead of the inside of the building. A ground floor is the best floor for an ice house, and should be filled in or have a natural elevation just enough to keep away surface water from the sides, and prevent water from raising to the ice from beneath the surface. Level off and spread a thin coating of oat-chaff or sawdust and it is ready for the ice. The simpler the scheme of the building the more satisfactory it will be. It is an easy thing to keep ice if a few principles are observed. The building should be of wood, as stones or bricks draw heat, and white is the least objectionable of all colors. The frame should be ceiled up on the inside at least a foot from the outside, and the space filled with sawdust. "Why not put sawdust between the outside and the ice, and save cost of the ceiling?" asks one. Because the damp sawdust will rot the frame, and in a few years your building will fall down. The ceiling has nothing to do with keeping the ice; it is to keep the house. A roof that will shed rain and the sun's rays is enough. The air above the ice should be dry, and to be kept so must be kept in circulation, and two small open windows on shady sides accomplish this end.

The first layer of ice should receive a good deal of attention, and the most intelligent and careful hand should be put at this part of the work. The ice should be cut true and packed level and close. Fill in six or eight inches between the sides and the ice, packing firmly, so the cakes cannot move, and then level off the surface with an adz, filling all cracks. Sprinkle on water and freeze all solid. It pays to handle ice in quite cold weather, as it is dry to handle, and can be packed better. If air-holes are left the air will, as it gets cold, settle to the bottom and warmer air will follow. There should be no movement of air, a perfect expulsion of all air, and the nearer one comes to it, the less will be the loss by melting. The second layer should be packed smooth side down and the long side of the cake out, so as to make as few cracks at the side as possible. Adz off and pack sides and fill cracks with fine cold dry powdery snow that will run down and fill air spaces. Pour on water and freeze solid; keep on till full. Sawdust is the best material for packing, and the drier the better, but do not make the mistake of throwing away the old, unless rotten, for new. The new is liable to ferment and heat some, while the old has the fire all taken out, and is the best for several years. The bottom must be absolutely airtight and have no drains or air passages under it. A covering six inches deep of the sawdust on the bottom and sides, with the layers solidly frozen, makes all airtight, and there will be no melting. The covering on the top should be two feet thick, and kept dry at the surface. In the warming days of Spring the surface should be tramped over and all air-holes filled to keep all airtight. One should shovel over the sawdust a few times, now, and air and dry it ready for use. Some haul it out to an open shed or building, and then have to haul it back again while filling it. One is usually busy then, and the team is needed to haul ice, and I like my plan better. Put a temporary partition across one end, say a third of the space, and shovel the sawdust to that end, piling it up as high as needed to hold it. Commence filling the space, and use the sawdust nearest to you as long as you can, and then pile the remainder on top of the ice and commence at the bottom again. By this method some labor is saved, the sawdust is always handy, and the litter of it over everything is avoided. Cakes weighing about 100 to 130 pounds, 18 inches long and 12 inches wide by 12 inches thick, are handy to handle, and ordinarily are as large as one wants at once. C. E. C.

AUTUMN REFLECTIONS; NATURE'S MULCH

The Autumn is one of the most interesting periods of the year, and it ought to be from every nature observer's standpoint. At this season one has an opportunity to study the peculiarities of trees in a way not presented at any other time. To me one of the most interesting features about Autumn is the manner in which nature protects her own against the vicissitudes of Winter. The many precautions she exercises go on regularly, smoothly and unfailingly. For instance, let us watch the processes attending the maturing of leaves. Note how with the gradual changing of color tints the leaves become less pliant,



NATURE'S MULCH AROUND SHRUBS. FIG. 385.

grow papery; how the little joint appears at the connection between the leaf stem and the twig to which it is attached, how finally an easy and natural separation takes place at this point. At this time the twig has withdrawn practically all the food content of the leaf, which is then really a skeleton made up of fibrous tissue composing its veins, cell walls and epidermis. To the orchardist the fall of the leaf should not in itself be an uninteresting phenomenon, for its mission is not completed as soon as it drops from the tree. Let us observe what happens after the leaf comes whirling to the ground. Take a walk through a park, an orchard, or a cornfield. In the park, unfortunately, the enforced rules of tidiness which apply to leaves as well as waste paper, prevent one from noting the natural disposition of the trees' Summer suits, but in undisturbed places is it not fitting, appropriate and even thoughtful, the way in which the wind carries the leaves off the lawn and tucks them in little banks and billows about the base of the shrubs, as at Fig. 385, or covers the herbaceous border, or wraps them around the feet of a stray weed in the orchard. They are the plaything of the wind, and in their dried condition are whisked here and there until they finally find lodgment and are at once protected and protector—a resting place for themselves and a blanket for their guardian. One may be interested in knowing the weight of the Summer dress of a 10-year-old Norway maple for instance. Summer gowns, as a rule, are not weighty. In this case the condition is reversed. I was astonished to find the other day on carefully gathering and weighing the dried leaves which fell from 10-year-old Norway maple trees that the crop amounted to 130 pounds, or an average of 43 1-3 pounds apiece. While this weight of vegetable matter does not represent a large amount of plant food it does represent an agent of considerable value in its relation to the physical quality of the soil. No one who has composted leaves and has used this compost as a mulch for the herbaceous border, the rose or lily bed, can fail to recognize the great ameliorating influence of this sort of a dressing upon the physical properties of the soil. Its protective value in keeping out frost is also considerable. These notes are simply dropped by the way in order to suggest that a much better use can be made of nature's mulch than is the case when the lawn is religiously raked every second day during the Autumn, and the rakings carefully burned. When this is done the carbon is simply returned to the atmosphere from whence it came, and the almost inappreciable amount of ash is wasted entirely.

JOHN CRAIG.

NATURAL GAS ON THE FARM.

How a Kansas Farmer Uses It.

PART I.

We have had an extraordinary warm and dry Fall, and last night (December 2) it was warm and pleasant. The barometer had begun to rise, indicating a cool wave, and when I went to bed I set the cool wave signal, so that when the wind changed to the north, the large sail would fill out and strike an alarm on the farm bell. The big 16-horse steam thrasher had finished thrashing millet for me, and stood in the hogyard, and if a cool wave came up I had promised the owners I would keep it from freezing up. At 2:30 A. M. the farm bell tolled its alarm, and I got up to find a veritable cold wave bearing down upon us. I started a fire under the boiler of the thrasher engine, saw that the pigs were warm and comfortable, shut the storm door to the sheep shed, saw that the Shorthorns were all right in their barn, the bulls in their stalls, the horses in theirs; then crossed the yard and saw that the two herd boars and the several youngsters were warm; looked into the brooder and read the temperature, visited the incubator, making sure it was going along on the even tenor of its way, then entered the house, turned up the lights, started the four stoves at a merry clip and now I am at my desk near a warm fire, under two powerful incandescent lights, with the telephone receiver hanging within reach, the large bunch of daily mail delivered at the door every day by Uncle Sam, near at hand, and the great storm howling without.

Could an eastern reader of THE R. N.-Y. come along just now he would see about 26 windows in the house throwing out that intensely white light due to incandescent burners that are never turned out night or day, the great light in the door yard that lights up several acres and sometimes the stand flue over the hoghouse is light, which lights up the five corrals and all the sheds and barns; the light in the feedhouse is always burning and a warm glow is sent out through the windows, and now at this early hour I will tell R. N.-Y. readers all about the uses of natural gas on the farm, for this farm and thousands of others in this and other western States have all the natural gas they wish to use for farm purposes.

So many have such an erroneous idea of this country. They think it is in the great Staked Plain; that it is a desert; that we have no comforts, and many other ideas. Kansas is not "out West," but is the center State of the Union, the exact geographical center being three miles from Junction City, Kan., 120 miles from here. We have all the luxuries that any farm community has, and some that few of them have. Two steam railroads run east and west on my south line; an electric car goes every hour in the daytime, and two steam roads go north and south only 1½ mile from the farm, while two long-distance telephone lines pass the door, giving each farmer communication with the outside world at any hour. Daily rural delivery of mail and the daily visit of the creamery wagon make our lives easier and pleasanter, while the abundant use of natural gas on the farms here and in adjoining counties, gives us positive luxuries that only the very rich city people can possibly afford. From the Gulf of Mexico to the Canada line there is a strip of country that abounds in natural gas, artesian water and oil, and thousands upon thousands of farmers in the great gas belt use the gas, so I do not want anyone to think that what I do with gas is at all unusual, but on the contrary, is common here. Five years ago the Standard Oil Company secured leases on all this land through independent parties that they bought out, built a dozen large 1,600 retort smelters and rolling mills, also acid plants about six to 10 miles west of here, developed the gas field and are now holding this part for future use, not expecting to drill here for 30 years or more, but they have laid large gas mains along every lease, and they pay $50 per year royalty for the lease on each 40 acres, and give all the gas wanted for use on the farm. The main that passes my door comes from a well eight miles away, and has a pressure turned on of 290 pounds per square inch. This enormous pressure is entirely too much and all the gas we can use, hardly relieves the pipe any, and as these wells have not diminished in 20 years we do not think of being very economical with the gas. All the farmhouses and school houses near here have a chance to use the gas, and it is so common that we think nothing of it, so I do not wish any reader to think I am trying to boom up my farm, for it is not for sale at any figure. All the towns near here burn gas, and this is truly a well lighted and warmed county indeed.

Allen Co., Kan. J. CLARENCE NORTON.

FARMERS' CLUB

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Starting Persimmon Seeds.

L. A., Benton Harbor, Mich.—At what time and how deep should persimmon seeds be planted?

ANS.—Plant soon after fruit is ripe, placing four inches apart and about two inches deep in rows three feet apart in good mellow soil. It is a good plan to cover rows with a board during Winter to keep out vermin.

Linseed Oil for Wheels.

Reader.—The tires of my carriage wheels are loose. Can I remedy this by soaking the rims in hot linseed oil, or is there danger of this treatment injuring the wheels?

ANS.—Carriage makers say that when a tire becomes loose the proper thing is to have it set by a mechanic who knows his business. Soaking in oil would not be a permanent remedy and might do damage by lubricating the joints so that the spokes would work loose.

Wood Ashes for Wheat.

D. W. H., Topeka, Ind.—Would it pay to put wood ashes on drilled wheat; also Timothy that I expect to mow? I can get ashes for asking. When would be best time to put it on, and how much?

ANS.—We would use all the ashes we could get. You may use two tons per acre. That is about the limit when they are bought. On level land we would apply the ashes at any time when the snow is absent. On land inclined to wash we would use the ashes early in Spring.

Value of Sawdust.

J. F. C., Maryland.—Is there any objection to the use of sawdust as bedding for stable? It must make a good absorbent.

ANS.—No, except when there are sharp splinters or old nails in it. Sometimes the dust from an old ice house contains sharp substances which injure stock. Fresh sawdust contains an acid which is injurious to most plants when the dust is used too freely. This acid is overcome when the dust is rotted or used as an absorbent in manure. The ammonia in the manure neutralizes it.

San Jose Scale.

B. L. H., Campbelltown, Pa.—What are the insects or scales of which I send sample? Are they the San José scale? If so, what can I do to exterminate them? Some trees of little value I burned. The shavings sent are of the apple, currants and peaches. Currants are all coated. The twigs have reddish spots with minute grayish scales.

ANS.—The scale on the twigs received is the San José, or Pernicious. Cut the currants to the ground and spray the stumps. Trim the trees back and spray late in March with crude petroleum or whale-oil soap, two pounds to a gallon of water. Use same on currants at the same time.

Cutting Asparagus Tops.

A. S., Ooltewah, Tenn.—When should the bushy growth of asparagus be cut? After the drought of June and July our crowns sent up a good growth of new shoots, and we allowed the whole to grow until December. Should the first growth be removed earlier? Is it of any benefit to the crowns (five years old) to take only the largest spears during the cutting season, allowing the smaller to burst and branch? What is the proper time and method for applying commercial fertilizer to crowns set two years ago?

ANS.—As a general rule the bushy growth of asparagus should not be cut during the growing season, or until it has thoroughly ripened after frost. It is not only of no benefit but positively detrimental to cut the strong shoots from the crowns, leaving the weaker ones to grow during the cutting season. It is much better to cut everything that appears above the soil while the season lasts, allowing all the shoots to grow as they are afterwards. Commercial fertilizers are best applied in Spring just at the close of the cutting season, or in young plantings before growth starts, and thoroughly plowed or cultivated in.

Rot-Resisting Grapes.

G. L., Pomerania, N. J.—Can you give me the names of several varieties of grapes that do not rot? It does not make any difference whether they are wine or table grapes. Can you advise me where I can buy Norton grapevines? Nurseries do not keep them in stock it seems; at least they are not catalogued.

ANS.—There are few grapes that are of such character as to be entirely exempt from rot, but Norton is one that I have never known to be thus affected. Cynthiana is exactly like it, and is thought by many to be the same variety with another name. Clinton rarely has any rot and the same is true of some of Munson's new seedlings, although the latter have been but little tested. The three kinds named are all poor for table purposes. Norton is rarely offered by the nurseries because few customers want it, and it is very hard to propagate. It will not grow from cuttings, and vines must be layered from which plants are to be obtained. Some of the largest nurseries advertising in THE R. N.-Y. may have them to sell. H. E. V. D.

How to Keep Pears.

A. F., Moriches, N. Y.—What is the proper method for keeping and ripening Winter pears, after they are picked? I give the care of the fruit my personal attention, and have followed minutely the directions given me by a popular nursery, but every year my pears shrivel and become hard, without ripening. The varieties are the Lawrence, Easter, Mallnes and Anjou. So far I have had no difficulty in growing the pears, but have failed utterly in ripening them.

ANS.—Pears should be kept in closed packages, so the fruit cannot evaporate to such a degree that it will shrivel. If each specimen is wrapped in paper the possibility of evaporation will be still further lessened. In ordinary cellars or fruit houses the ripening of pears will go on in the way that is characteristic of each variety, but this will vary according to the warmth or coolness that may prevail. If the pears are put in cold storage the process of ripening will be very much retarded. When it is desired to have them ripen all that is necessary is to change a box or other package to a warmer room, but by no means exposing the fruit to the open air, because it would cause shriveling and loss of flavor. For family use I think it pays to wrap each pear in paper. It not only preserves the fruit from losing moisture, but flavor as well. H. E. V. D.

"White Ants" on Apple Roots.

R. O., Bluffs, Ill.—1. I enclose some ant-like insects which I find on the roots of dead apple trees, which were set last Spring. What are they, and did they cause the death of the tree, or attack it after it is dead? 2. Could I select better varieties of apples for sand in western central Illinois than York Imperial and Ben Davis? How would Stayman Winesap do on deep sand?

ANS.—1. The ant-like insects were what are commonly known as "white ants," because they look like true ants and have somewhat similar family relations, but structurally they are quite remotely related to the true ants in the insect world. White ants usually live in colonies in dry or decaying wood, or in books, and they often destroy libraries and buildings in the South and the tropics. They usually work in old logs or stumps in the North, but there are several records of their tunneling into living plants, such as geraniums. I do not recall any report of their working in trees in the North, but in the South they sometimes do much damage by eating into the roots of orange trees. Hence, the white ants may have been the cause of the death of the trees, or they may have just begun to work in the dead roots, but as the trees were only set last Spring, I should be inclined to attribute their death to the insects. I would remove the infested trees carefully, so as to get as many of the white ants as possible with the trees and then burn them. Thoroughly disturb the surrounding soil and do not allow any vegetation to grow there until you set new trees in the Spring. 2. Prof. Craig says that no varieties of apples will do as well in sand as in heavier soil. The trees may come into bearing a little earlier on sandy soils, but they usually do not last as long. Haas is a good variety to grow in sand, but it is not of high quality. He thinks the varieties mentioned will do as well as any others. Note what varieties your successful neighboring orchardists use, and study your market's needs.

M. V. SLINGERLAND.

Peaches for Central Illinois.

J. M'C., Havana, Ill.—1. What varieties of peaches would you advise for central Illinois, one-third to be extra early and the remainder continuous in ripening? Name the best three clings for the latter part of the season. I expect to put out about 200 trees. My soil is quite sandy. Do June budded peach trees come into bearing as soon as older trees, or, what is the difference? 2. How can grub worms be kept out of composted stable manure? They damaged my sweet potatoes seriously. Is fresh manure adapted to sweet potatoes, plowed under early in Spring?

ANS.—1. Of the very early peaches Triumph, Sneed and Greensboro are three good ones. Following these the Bishop, Mountain Rose, Elberta, Emma and Chairs are good. Of the very late clings the Henrietta, Wilkins and McDeavitt are the best I know. Sandy soil is good for peach culture. June-budded peach trees are a little behind those of the usual character in bearing. They are small and of feeble growth when set, and could not be expected to grow so rapidly and bear so early as the older and stronger trees do. 2. The beetles which lay the eggs that make white grubs are almost sure to find every pile of manure whether in heaps or scattered, and I know of no way profitably to keep them out. Mosquito netting would be costly, but it would protect the piles from the beetles getting to them. It might pay to cover the compost heaps in this way. I have often seen fresh stable manure put into the land which was planted to sweet potatoes the same year, but it did not prove as suitable as that which was well rotted. Stirring it in with the soil by repeated plowing or deep cultivation before planting would have an excellent effect.

H. E. V. D.

Dr. D. Jayne's Expectorant certainly does go directly to the root of all Throat and Lung troubles. There is abundant evidence of this in its sixty-two years' record of cures.—*Adv.*

Weevil in Beans; Stringfellow Planting.

W. J. S., Albion, N. Y.—1. Our bean crop was quite badly damaged by weevil here last Spring, many pieces being plowed up. Is there any way to tell whether this year's crop now stored for seed is infested? I have many times seen the holes in peas, but not in beans. 2. Your article on old orchards comes at a seasonable time for me, as I have just commenced cutting the dead wood out of about 30 trees. I shall also set half a dozen peach trees by the Stringfellow method. Do I cut off everything but the tap root?

ANS.—1. We would send a fair sample of the beans to Prof. M. V. Slingerland, Ithaca, N. Y., for examination. As a precaution we would use bisulphide of carbon in the way so often described on all the seed beans. 2. In setting trees on the Stringfellow plan this Fall we left short stubs—not pruning as closely as we did last Spring.

Good Apples for Maine.

C. H. C., Wells Branch, Me.—I think of setting out about 100 apple trees. I shall set one-half Baldwins and want some other good red Winter apples. What would you recommend? What do you think of Ben Davis, Wagener and Arctic?

ANS.—It is difficult to find a more satisfactory commercial apple than Baldwin, as grown in western Maine. For purposes of cross-fertilization, however, I would include 25 Sutton Beauty and possibly 25 Ben Davis—planting in alternate rows with the Baldwins. Ben Davis is hardy, vigorous and productive, and is at present one of the profitable commercial varieties. Its quality, as grown in the North, is, however, so inferior that it is hardly to be recommended. Wagener is a good apple but is not as large as in Massachusetts and New York, and is not equal to some other sorts for commercial purposes. Arctic may be characterized as a hardy Baldwin. The tree is of vigorous spreading habit, and the fruit, when well colored, is attractive. Trees set eight years ago in the orchard of the Maine Experiment Station bore two bushels of fruit this year. It will not supersede Baldwin in southern New England, but is valuable for sections demanding greater hardiness. W. M. MUNSON.

Maine Exp. Station.

Paper from Cornstalks.

Is it a fact that paper of fair quality has been made from cornstalks? Nearly everything else seems to be made out of the corn plant!

Experimental trials of the material have been made from time to time, and there is no doubt that paper stock of excellent quality, although rather short-fibered, can be made from the stalks by chemical treatment. The principal difficulty in the way of its utilization is the low yield as compared with wood. We doubt whether the fiber could be sufficiently disintegrated by purely mechanical methods to be available, on account of the siliceous character of the epidermis. LITTLE & WALKER.

Boston.

There has been considerable talk in the papers about the use of cornstalks as paper-making material, but we think it has been pretty much all talk, as we do not know of any mills that are using the material, and if it is being used at all it is in a very small way. We don't know anything about the pith either, other than the notices we have seen in the papers, and which seem to have gone the rounds, but we really believe there is very little basis for any such comment. About 20 years ago there was a considerable amount of straw used for making fine papers, but wood in later years has almost entirely displaced it. Sorghum cane was used for making book paper in at least one mill so long ago as 1867. There are enormous quantities of what is known as bagasse, being what is left of the sugar cane after the juice is expressed, in the sugar-cane districts, and at various times attempts have been made to use this material, but without much success. We understand there is one mill in Louisiana making a small amount of coarse grade paper. There is, however, more interest being taken in the use of plants that grow up each year for paper-making purposes, and there has been a lot of experimenting in the way of using these annual plants, and with some probability of its being done successfully on a commercial scale. Wood, however, is so extensively used that it would probably take a number of years to displace it. WEST VIRGINIA PULP & PAPER CO.

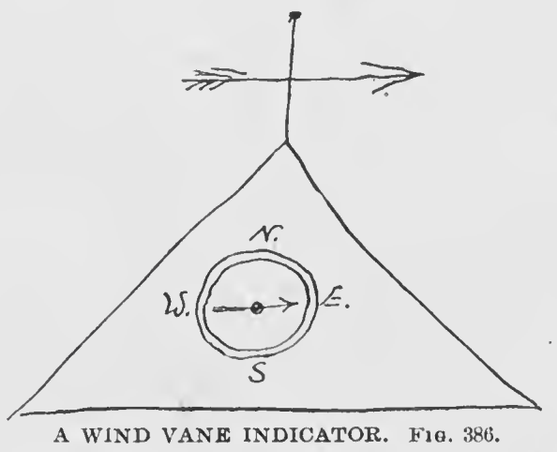
New York.

Can You

do a little pleasant and profitable work for us in your own town? No experience necessary. We will explain just what you have to do. The work will be light, and we will arrange for the time you shall be able to give to it. We can give you work for all your time or just for your spare time. Write for full particulars. THE RURAL NEW-YORKER, NEW YORK.

A Wind Vane Indicator.

While riding near China Lake, in this county (Kennebec), not long ago, I saw a peculiar weather vane or indicator. In order to read aright the ordinary vane, one needs to be almost under it. In this case, however, a glance shows the direction of the wind, as the face of a watch shows the time. The



A WIND VANE INDICATOR. FIG. 386.

rod to which the vane is fastened passes down through the roof in a short piece of gas pipe, and is geared at the bottom to a longitudinal rod upon which is the indicator. It is said not to be patented, and is very simple. I make a rough illustration, Fig. 386. When once adjusted the hand and vane always work together. C. S. P.

Maine.

Peaches for Northern New Jersey.

The following facts were brought out in a recent correspondence with a large peach grower in Sussex Co., N. J.:

Do you like to plant June-budded trees?

No, we have never planted them and I do not consider it worth while giving them a trial. We prefer the largest trees that we can safely plant.

What varieties do you find most profitable?

I shall plant next Spring, Emma, Late Crawford, Chairs Choice, Iron Mountain and Beer's Smock; this list is given in order of ripening, Emma gives us fruit about September 18, Iron Mountain and Beer's Smock fruiting up to the middle of October.

Do you not grow Elberta?

I tried to buy 500 Elbertas for next Spring, but the trees were all sold, and so I bought 500 extra Emmas.

Do you recommend these varieties for general use?

No. Differences in location will make differences in varieties; for example, Stevens Rareripe has been a money-maker with me, while with other nearby growers it has not done so well.

Which have been your best paying varieties?

Elberta, Chairs Choice and Beer's Smock have paid the best; really I have made more money per package out of Beer's Smock than from any other variety.

Are there two kinds of Smock peach?

Yes; there is a Smock shaped like an egg but very small, this is of little value with us, but the true Beer's Smock is a fine peach; it is also the best canning peach we grow. Some of our growers have planted Wonderful in place of Beer's Smock, claiming it is better because it is less liable to overbear. The season of Beer's Smock with us is from October 1 to 10.

What do you think of Crosby?

I would not advise its planting as it ripens here at the same season with Elberta, is much smaller and tends to overload. When Elberta is selling for $1.12 to 85 cents Crosby can be bought for 60 to 45 cents, and it was hard to get enough fine fruit to fill the packages. I have no Iron Mountain but it does well here, having the same season as the Smock, and I shall try it.

What is the best market demand for your peaches?

There is always a demand for a late white peach, and the Iron Mountain will fill the bill. I would not advise planting for the New York market any varieties later than Elberta, which finishes with us about September 15. The Emma comes in after Elberta, and that is why I ordered that for next Spring.

AN ACTIVE CHINAMAN.—The Pacific Rural Press gives this report of a Chinaman who raised tomatoes for a canning factory: "A certain Chinaman was induced by the superintendent of the cannery to plant five acres to tomatoes. From those five acres he has sold to the cannery over 50 tons of first-class tomatoes, at $10 per ton, and at this writing he is still hauling them in. Now, what could have been done on a 100-acre patch had white men given the care and attention to their business that this Chinaman knew his business had to have? This sleepy-eyed Celestial seems to be personally acquainted with each individual plant in his patch, and to know about the day and hour he can depend on it to ripen its fruit. And he is carrying away in some unknown part of that garment of his which passes for his 'pants' the good dollars that ought to be going into a white man's pocket. But the white man, even with the advice and under the direction of the able and experienced horticulturist, failed to show up the stuff. Hence these tears."

BARNS—Write for free book how to build. FRANK BRYAN, Mechanicsburg, O.

Use Mapes' Warming and Ventilating Drum

in your hen roost, and prevent all freezing. Utilizes animal heat. Fifty-hen size, $3.50. Full directions with each drum. THE MAPES VENTILATING CO., Middletown, N. Y.

THE DE LAVAL COMPANY

Acknowledge that they

Have been Lying About Paris Separator Awards

Qne of their latest advertisements is headed

"More Lying as to Paris Separator Awards"

which is one of the most truthful statements they have made lately, as we believe the readers will acknowledge if they try to reconcile some of their statements in the advertisement referred to with some in their previous advertisements.

In the advertisement headed "More Lying as to Paris Separator Awards" they publish what purport to be three "official" statements, dated Stockholm, Sweden. A careful perusal of these will show that they are what the courts call secondary evidence and never accepted by any court if there is primary evidence. The Paris Exposition was not held in Sweden.

Two weeks ago they advertised as follows:

> "At the Paris Exposition the DeLaval machines received the Grand Prize, or highest award * * * being entered and receiving such award in the name of 'Société Anonyme Separator,' which is the French translation of 'Separator Corporate Company,' the name of the DeLaval European organization."

Notice by this advertisement they claimed "Société Anonyme Separator" to be their European organization, thus acknowledging that no award was given to Aktiebolaget Separator.

But when we proved that "Société Anonyme Separator" exhibited a Butter Radiator or Butter Extractor, and not a Cream Separator, they lose their tempers again and accuse us of "lying and misrepresentation" and advertise the three statements referred to above in their efforts to prove that the Aktiebolaget Separator did get an award at Paris and claim it as their European arganization.

We call special attention to the dates of these statements, viz.: December 5, 1900; April 2, 1901, and April 17, 1901, then ask the reader to bear in mind that it was in the last of November, 1901, that they advertised that the award they claim was given to "Société Anonyme Separator." From which it will be seen that they pay no attention to facts or their previous statements when caught in a trap.

Being cornered on one claim, they abandon it and claim another; cornered again, they go back to their first abandoned claim. We recommend our "would-be competitors" to try once more.

An expert remarks that the DeLaval Company will have to "eat hair" in order to make their statements hang together.

We still say that the official list of awards distributed at Paris did not contain an award to the DeLaval Separator Company or the Aktiebolaget Separator.

To be continued in our next.

The United States Separator still leads the World. To-day it has no equal.

VERMONT FARM MACHINE CO., Bellows Falls, Vt.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

SWEET POTATO TRIALS.—Plants of the following varieties of sweet potatoes were forwarded for trial by F. S. Newcomb, Vineland, N. J., and received on the Rural Grounds June 5. They were immediately planted in a suitable plot of sandy loam in ridges three feet apart, the plants being set 20 inches apart. Well rotted manure was incorporated in the ridge at the rate of one bushel to 20 feet. The plants all made a strong growth, and the resulting crop was better than the average in the neighborhood. The potatoes were dug October 9 on account of threatened frost while most of the vines were still growing.

VINELESS BUSH.—Short, stubby, but vigorous growth; rank foliage but true bush habit. Not one of the 20 plants showed any inclination to run. Large yield of long, light yellow, well-formed potatoes. Good table quality. A very desirable variety but a little late for our locality.

VINELESS GOLD COIN.—Very heavy broad foliage; grows about one foot high. Not quite so compact as Vineless Bush. Large yield. Tubers spindle shape, light buff, or creamy white in color. Evidently later than Vineless Bush and less agreeable in quality.

BIG STEM.—Apparently a sport of Jersey Yellow, with enormously thick red stems. Large heart-shaped foliage, rampant grower. Moderate yield of long spindling, light yellow tubers, stringy and irregular in form. Apparently too late for us. Quality very fair.

EARLY GOLDEN.—Moderately vigorous. Heart-shaped foliage, with slender creeping stems. Very heavy yield of long, smooth, well-formed deep yellow tubers growing compactly in hill. Easy to dig and store. High quality, cooks sweet and dry. One of the earliest and best.

NEW SWEET COREY.—A strong but not rank grower. Fine yield of golden yellow tubers, smooth and fair. Rather blunt and short in form. Set close in hill and dig easily. Medium early. High quality. Good in every way.

GEN. GRANT.—Strong grower with rather small foliage. Good yield of large, bright buff, irregular potatoes growing in a scattering manner. Good table quality.

UP-RIVER.—Slender but a vigorous grower, ripens early. Probably the best yield of all. Smooth, fair, slender tubers of wonderfully even size, deep yellow in color. Grows compact and digs well. Excellent quality.

PIERSON.—Vigorous, large, coarse, vines and heavy foliage. Good yield of large, light-buff tubers much scattered in hill. Long and rather irregular in form. Medium early. Quality very good.

RED BERMUDA.—Strong grower with heavy foliage. Good yield of long, large, dark-red tubers; set compactly and dig well. Medium early. Quality sweet but rather watery when boiled. Very good when baked.

BRAZILIAN.—Plants seemed to be tender. Several rotted at collar when half grown, apparently from excessive rain. Light yield of long, light buff, irregular tubers. Quality only moderate, though claimed to be the sweetest. Evidently too late for northern New Jersey.

JERSEY RED.—This and the next variety are much grown locally, and are market standards. Slender vine but a rapid grower. Fine yield of deep red, smooth tubers; grows compactly. Late medium in season.

JERSEY YELLOW.—Slender but vigorous. Good yield of fair bright yellow potatoes, early and compactly set. Dig well. Most popular sort here, but divides honors with the preceding. Both are of excellent table quality, but we always prefer the yellow sorts.

All the varieties tested can be recommended with the exception of Brazilian, which appears to require a longer season and less humidity than we had last Summer. The medium-sized early, bright yellow kinds like Up-River, Corey and Early Golden suit us best in manner of growth and table quality, while they would be very attractive in market. The large light sorts of the Gen. Grant and Pierson type probably yield better in deep rich soils, but are rather too slow in development for latitudes north of Philadelphia. The new Vineless Bush impresses us very favorably where sweet potatoes must be grown in narrow limits, but we think it should have as early a start as practicable.

NEW ANNUAL SUNFLOWERS.—Sunflowers have long been conspicuous objects in country gardens, but the kinds grown have usually been confined to the large-seeded, tall-stemmed type, varieties of Helianthus annuus. Although a native plant, occurring wild from Minnesota to Texas, it is largely grown in all temperate countries for its seeds, which are used as food for poultry and also cattle after the oil is expressed. In Russia the seeds are much eaten as we use peanuts, but without roasting, and are freely sold by street vendors. The gigantic flowers of the single and double varieties are very striking but rather too coarse in outline for planting in near situations. They come in splendidly for backgrounds and other places where tall vegetation is wanted. Another native annual species, the Cucumber-leaved sunflower, H. debilis, has been greatly improved by European plantsmen, and is now offered in many dwarf, free-flowering varieties. They are usually catalogued under the name of Helianthus cucumerifolius, this name being just displaced by botanists under the rules of priority. The species grows wild in rich moist places throughout the warmer parts of the United States, and is generally found three or four feet in height. The improved varieties are much lower and more spreading in habit. H. Perkeo, a novelty of the season, was said to grow less than 12 inches high and cover circles of more than 18 inches in diameter. Our trial plants proved quite variable, growing from 10 inches to two feet high, and branched profusely. The dwarfer ones were true miniatures, and were covered with very bright and handsome flowers from late June until frost. When this low-spreading propensity becomes thoroughly fixed the Perkeo type will be a very useful garden flower. The blooms are single, nearly three inches across, dark yellow with a blackish purple "eye" or center. Among the taller types may be found quite extensive variations of color, from almost clear white, through creamy white to yellow and deep orange. All have the dark eye. There is another class announced for the coming year imitating the Cactus Dahlias in the odd forms of their quilled, twisted and fluted ray florets, usually spoken of as petals. The colors run through cream and lemon to deep yellow, and there are both dark and light gray central disks. One of the best known of these "cut and come again" sunflowers, so-called from their continuous bloom and usefulness as cut flowers, is sold as Stella. It is quite variable, and often comes fairly double. Planted as a background about two feet apart it makes a fine show throughout the long blooming season. Last year hybridization was effected on the Rural Grounds between a selected single bloom of Stella and a large double-flowered Russian variety. The hybrid thus obtained bloomed profusely the past season, some of the plants growing nearly six feet high, forming well-shaped bushes four feet across. The semi-double blooms averaged more than six inches across, and were borne on particularly long stems. Altogether it made a fine plant and looked like a good thing, but turned out almost completely sterile, only three plump seeds being secured from the many hundreds of blooms. The graceful habit and spotted stems of H. debilis were retained. It is possible that further attempts may produce seed-bearing plants having the same characteristics. W. V. F.

For the land's sake, use Bowker's Fertilizers. They enrich the earth.—*Adv.*

J. H. Hale on Peaches.

On page 804 I notice a reference to peaches, which should be corrected. Matthews peach is almost a reproduction of Smock and ripens fully as late. Emma is in no respect like Elberta (except it is yellow, but so is Triumph), and to suggest that it is will do great harm in tempting people to plant it, thinking to have a peach as fine as Elberta, only later. Emma is a *very poor growing* tree of Early Crawford class; has sickly yellow foliage, is quite unproductive, has a few large peaches and more very small ones. A few growers in the South have made some money out of it, as the few large peaches that were produced coming in just after Elberta, brought very high prices; all the same, it is a peach for planters to let alone. Elberta peach is being too largely planted, and in Elberta season in future years you are going to see flooded markets, and no mistake. Consumers are going to be all right, while growers who like to work for fun will have their hands full, and most likely empty pockets. Georgia will plant from 2,000,000 to 3,000,000 Elberta trees this Winter, and probably 1,000,000 or 2,000,000 more would be planted if the trees were to be had. For months now my nursery has had daily calls for Elberta in lots of from 5,000 to 50,000, while there is only a moderate call for more profitable earlier and later varieties. We nurserymen expect a picnic in the sale of Elberta trees for a year or two more, when a "busted" market will teach the orchardists that it is even possible to have too much of a good thing. J. H. HALE.

HYDROCYANIC ACID GAS.—In some recent issues of THE R. N.-Y., Prof. E. D. Sanderson, of Delaware, explained how the gas spreads in fumigating houses. He has now received the following note from C. P. Lounsbury, Entomologist, Cape Colony, S. A.: "In our work here, we have often been puzzled by the behavior of the gas. For instance, on one occasion a caged rat survived an hour's exposure in one ounce to 180 cubic feet of gas, when a large dog tied in another part of the room succumbed in a few minutes; and again three rats in a cage left almost beside the generator were still alive (though they died later from the effects) after an hour in one ounce to 150 cubic feet of gas. We did not understand such vitality, when at other times we saw rats gasp their last in a few minutes—presuming as we did that the uniform dissemination of the gas was complete in a few minutes. On principle I have had the government 'fumigatoriums' built with the ceilings highest at the center so as to throw back the ascending gas and placing the dish in the center of the space is practiced."

HOPE FARM NOTES

RYE STRAW MANURE.—I have the following letter from Yates Co., N. Y.:

In Hope Farm Notes, page 807, you speak of selling rye straw. We sold ours, and many of our neighbors also, not for $15 per ton, but for $7 baled. We paid $1 per ton for baling and boarded men and teams. Did this pay at this price after hauling to market? Would our land be better off with this straw worked into manure; or this straw money spent for chemicals? If rye straw will stand 150 years in mortar, how long will it take to rot into manure? Our rotation is rye, clover and beans, the clover being plowed under for beans, and rye sown after beans without plowing. After getting two crops of beans we put in a hay, corn and wheat rotation, seeding to clover again after the wheat. From your figures that rye straw is worth $2.40 per ton as fertilizer, at the price of chemicals here. Is there $2.50 or $3 worth of humus in it that will pay quick returns for the trouble of handling long rye straw in manure? We use our manure on the corn, but have to help it out with a potash and phosphoric acid mixture. The serious question with us is humus. Our soil gets lumpy and hard after rains, and when in this condition the chemicals do not show results. H. E. M.

I have always regarded rye straw as the poorest of all humus crops except in some cases on heavy clays. It is so tough and hard that it does not rot readily. I have told how my neighbor, in tearing down his old stone house, found in the clay which was used for mortar, pieces of rye straw which were still quite tough. They were put in that clay nearly if not quite 150 years ago, and had never rotted. Of course that is not a fair test for the straw as humus, for in any cultivated soil the air and water would be admitted so as to rot the straw. It would be slow work, however—in fact, I think rye straw will stay in the soil without yielding up its plant food longer than any other ordinary humus crop.

USES OF HUMUS.—On some stiff, heavy clays this might be desirable, for these soils are naturally rich and do not need plant food as much as they need shaking up. The stiff, hard rye straw holds them open—makes them porous and admits air and water. There may be one case in 50 where such a thing as delaying the decay of humus would be desirable. In the other 49 the best plan would probably be to make it available as quickly as possible. Humus is not unlike money. There may be some cases where it is desirable to lock it up so that we cannot obtain the principal for years, and where the interest will be almost too small to count, but in the great majority of cases, we like to have our property *available*, so that we may turn it easily and obtain a quick income from it. I would certainly sell the rye straw at $7 and buy potash and dissolved rock with the money. It is true that analysis shows that the rye straw contains some fertility, but that fertility is locked up so tight that it is not worth $2.40 as compared with the same value in rock and potash or in clover, because it is not so available. At the same time I believe in green rye as a humus crop under some conditions. We often use it, but we would plow it under while it is soft enough to cut for hay. You can adopt a child while its habits are soft and pliable, and it may help nourish your family tree. If you wait until these habits have hardened and stiffened your tree will need something stronger than Bordeaux Mixture. I prefer to use humus that decays quickly.

BUCKWHEAT OR COW PEAS.—This leads up to the following question:

I would like to ask some of your people who are growing cow peas in the North, whether they think it would pay me in southern Cayuga County to sow peas on a meadow that is cut early, say June 15, and plow in the next Spring for potatoes, or as I am doing now, sow to buckwheat July 1, and after this sow rye about October 1 and seed with clover, which is cut once and then plowed again. I can generally grow about 25 bushels of buckwheat at 50 cents a bushel. Do you not think this money invested in chemicals would do more for the land than cow peas?

If I lived in Cayuga Co., N. Y., I should go to Cornell University and get Dr. I. P. Roberts to look at the tongue of that farm. I don't feel like giving direct *advice* about cow peas for any farm north of my own. I know that with us cow-pea vines make the most quickly available humus of anything we can put into the ground. Get a good mat of them, let them lie on the ground over Winter and plow under in the Spring. They equal well rotted manure in their effect on the next crop. I am on record as saying that I would not sow cow peas on land that is already good enough to grow a fair corn crop. I will stick to that, although men who should know more than I do about it say it is not good advice. With my present experience, if I had that meadow at Hope Farm, I would cut it early anyway. If my other crops were such that I expected to be short on grain I should sow buckwheat, but add to it a peck of Crimson clover seed per acre. If, after the buckwheat were cut, the clover looked well, I would let it alone—plowing it under in the Spring for potatoes. I would double the $12.50 obtained for the buckwheat (it would bring more with us), and buy high-grade fertilizer to go on each acre of potatoes. The clover would, I think, be far ahead of the green rye for fertility. Would it equal a crop of cow peas? I do not think so, still we use fertilizer for potatoes anyway, and the old meadow and the clover supply plenty of humus. The 25 bushels of buckwheat will remove 22 pounds of nitrogen, four of potash and nine of phosphoric acid. With the $12.50 I can buy 225 pounds nitrate of soda, 125 muriate of potash and 400 pounds of dissolved rock, or 35 pounds of nitrogen, 60 of potash and 50 of phosphoric acid. If this were not a piece of meadow land, or if Crimson clover did not do well here I should certainly omit the buckwheat and sow cow peas—spending most of the money that the buckwheat *would have bought* for potash and rock to use with the cow peas. I would not think of planting potatoes in soil that was lacking in available humus. I don't believe there is anything equal to cow-pea vines for this purpose. What comes next? In our experience Crimson clover and coarse manure are about equal! Of course all your fields are well covered at present with a humus crop? I regret that truth compels me to say that there are several bare fields which ought to be covered. Why do you not practice your own preaching? I fear I am like the minister who said he preached so much that he didn't have time to practice. Most of Hope Farm is well covered this Winter, but the wet season crowded work so that part of the land could not be seeded.

WOMAN'S WAYS.—Winter is usually a hard time for the women on the farms. They are often shut in for days or even weeks at a time. We have no telephone yet at Hope Farm, though we ought to have. The Madame doesn't like the cold, and the wind over the hills is so fierce that she doesn't go out unless there is some urgent need for it. A lady in New York State sends me this bit of opinion:

If farmers' wives would help with the chores, be on familiar terms with cows and horses, also the poultry, go out to the barn every day, no matter what the weather, happier women would be the result, for with health comes happiness.

A. E. V.

I'll leave that for some one else to discuss. No thank you—I know better than to attempt to tell the women folks what they ought to do. As I get older and better able to fill the largest chair in the house it becomes a source of regret to me that I wasted so much time in attempting to give advice. Do they prefer to have those of their own sex advise them? Now you won't get a word of opinion out of me except the fact that I would like to ask if women doctors usually have a very large practice. I suppose most men conclude at one time or another that their wives have no such thing as judgment. If it is possible to make them comprehend the truth they will wake up some day to learn that their much prized "judgment" is like brass beside the golden instinct which prompts a woman to know what is best.

A lady in Michigan writes that she is much interested in Billy Berk and the other black boarders because they have Berkshires on their farm. But she says:

Those same little pigs that I think so much of rooted out my Ruby Queen rose so that it died. I felt so bad about that, but those pigs got shut up, so they do not root out any more roses for me.

I'll warrant they were kept shut up after that. When a rose is so fine that Berkshires want to use it for a nose-gay we may conclude that it is worth rooting for. If I may be permitted to make an observation right here, I will say that it is too bad that more of our farm women do not make a firm stand against things they are justified in opposing—*before the pigs root up the roses.*

FARM NOTES.—The weather continued cold through the first week in December, giving our part of the country the coldest Thanksgiving season for 30 years. The frost crawled deep into the ground and drove all hands out of the cellar for the new house. A warm wave followed, but that cold snap will crackle all through history as a time for frosted window panes, red noses and chilled fingers out of season. Charlie's speed as he brings in the morning's milk is a good index to the rise or fall in the mercury. . . When the cellar froze up the boys began to haul wood. We expected the steam engine in a few days to run the shredder and circular saw and so it was necessary to haul a big pile of logs from the woods. Coming down our steep hill with a heavy load was dangerous business, for the face of the hill was coated with ice. We use a low-down, wide-tired wagon. It is excellent for most purposes, but out of place on our hill in an icy season. It is difficult to lock these low, broad wheels so as to hold back. They slide like a wide-runnered sled. In very deep sticky mud these broad wheels pull hard, for the mud piles up over them. For all other kinds of work we prefer the low-down wheels. . . We find December, January and February the best months for feeding shredded fodder. I am speaking of the fodder that is usually brought to barn or stack. As a rule, it is not well cared for, being put in large shocks and not well cured. By March such fodder is usually moldy. It surely pays us to take pains with our fodder. It is, of course, all under cover and is green—not brown or dull yellow. It was cut into small shocks and left open to the air and sun. Of course our Fall has been very favorable to the proper curing of this fodder. Still, there is a right and a wrong way to do it, just as there is with everything else.

H. W. C.

A good season's work is that of the Cornell crew of experts, who by effective experimenting have taken a gold-medal machine, cleared its top of regulator, left it as clean as a table, and rendered the temperature on the level of the egg tray more even and uniform than has hitherto been attained. Write for catalogue to the Cornell Incubator Mfg. Co., 162 Brindley Street, Ithaca, N. Y.—*Adv.*

I will Cure You of

Rheumatism.

No Pay Until You Know It.

After 2,000 experiments, I have learned how to cure rheumatism. Not to turn bony joints into flesh again; that is impossible. But I can cure the disease always, at any stage, and forever.

I ask for no money. Simply write me a postal and I will send you an order on your nearest druggist for six bottles of Dr. Shoop's Rheumatic Cure, for every druggist keeps it. Use it for a month, and if it does what I claim pay your druggist $5.50 for it. If it doesn't I will pay him myself.

I have no samples. Any medicine that can affect rheumatism with but a few doses must be drugged to the verge of danger. I use no such drugs. It is folly to take them. You must get the disease out of the blood.

My remedy does that, even the most difficult, obstinate cases. No matter how impossible this seems to you, I know it and I take the risk. I have cured tens of thousands of cases in this way, and my records show that 39 out of 40 who get those six bottles pay, and pay gladly. I have learned that people in general are honest with a physician who cures them. That is all I ask. If I fail I don't expect a penny from you.

Simply write me a postal card or letter. Let me send you an order for the medicine. Take it for a month, for it won't harm you anyway. If it cures, pay $5.50. I leave that entirely to you. I will mail you a book that tells how I do it. Address Dr. Shoop, Box 570, Racine, Wis.

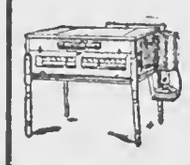
Mild cases, not chronic, are often cured by one or two bottles. At all druggists.

Bowker's Animal Meal will increase the egg yield of your hens and make your chicks mature early. Strongly indorsed by poultrymen. Enough for 10 hens, 3 months, $1.00; four times as much, $2.25. Send for free booklet, "The Egg," and testimonials.

THE BOWKER COMPANY,
Dept. No. 7, 43 Chatham St., Boston, Mass.

Dr. Greene of "Nervura" Fame.

Dr. J. A. Greene, the well-known proprietor of Greene's "Nervura," and also owner of the Roxmont Poultry Farm, at Long Island, N. H., writes: "I am a large user of Bowker's Animal Meal for poultry, and am free to say I believe every dollar spent in its purchase is doubly repaid by its use."



Incubators From $6.00 Up.
Brooders From $4.00 Up.
Fully Warranted. Free Catalogue.

The Rural New-Yorker

THE BUSINESS FARMER'S PAPER.

A National Weekly Journal for Country and Suburban Homes.

Established 1850.

HERBERT W. COLLINGWOOD, Editor.
DR. WALTER VAN FLEET, MRS. E. T. ROYLE, } Associates.
JOHN J. DILLON, Business Manager.

SUBSCRIPTION: ONE DOLLAR A YEAR.

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs.

"A SQUARE DEAL."

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

Name and address of sender, and what the remittance is for, should appear in every letter.
Remittances may be made in money order, express order, personal check or bank draft.

THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, DECEMBER 21, 1901.

We Are All Ready

to fill your orders for any papers or books you may need for next year's reading. We have taken a great deal of pains to develop a system by which we can send orders for other papers the day we receive them. Make out a list of what you want and send us with your order for THE R. N.-Y. We can save you money by sending the whole order to us in one remittance, and there will be less chance of errors and delays than if you send separate orders to the different papers. Orders for subscriptions should, however, always be sent as early as possible, as most large publishers get a week or two behind after the first of the year. We have perfected our system and have a trained force of assistants, and are prepared this year to care for every order the day it is received; but to secure other papers promptly orders should be in from one to two weeks in advance.

*

CONSUMPTIVE immigrants are now debarred from entering the United States, a consumptive pupil was recently ordered out of the public schools of Greater New York, and several States are said to be considering legislation which will prevent tuberculous persons from entering their borders. According to these indications, the consumptive will soon be ordered to get off the earth.

*

A TELEGRAM from Washington states that Speaker Henderson has organized the Committee on Agriculture so that it stands 12 to 5 in favor of the Grout anti-oleo bill. We do not yet know the exact make-up of the committee, but it is evident that one great point has been gained at least. THE R. N.-Y. returns thanks to the thousands of its readers who evidently voted with the postage stamp. Now keep it up until the victory is won!

*

WE are still receiving questions about the use of dry corn fodder in the silo. In theory it would seem as though dry stalks after husking might be cut into the silo and wet down with water so as to start a mild fermentation and make a sort of silage. We have repeatedly asked for experience in this line, but it is not forthcoming. We conclude, therefore, that this shock silage will shock a cow about as a dried-apple pie shocks a pronounced pie eater!

*

AT present bricklayers in London, England, lay one-third the number of bricks that they did for a day's work 30 years ago. The policy of some labor unions has been to reduce the day's work to the smallest possible amount and discourage the use of machinery that would displace hand work. The result has been to send large quantities of work out of that country. Speaking of this the Journal of Commerce says:

> Germany and Belgium have not only been getting iron and steel business that England used to have in foreign countries, but have been underbidding Englishmen in England itself. If this were due to the fact that the Germans were willing to work unreasonable hours at starvation wages one could regard the resistance of the English workman with high respect. But that is not the reason for German success, which is mainly due to the willingness of the German workman to use machinery, and, without working harder himself, to turn out a larger product. Machinery which is being rapidly introduced into American yards can either not be got into English yards without a strike, or can only be got in subject to conditions which reduce the work done by the men and do not increase the output.

Of course it seems very hard that a man who has spent the best part of his life at a trade should suddenly find that the inventor has hatched out a machine which does more work than he can, and at less cost, but this is one of the results of living in a country where progress and free thought are permitted. Any man, whether farmer, mechanic, editor, or statesman, who resists real improvement, will find himself swept aside. It is a wise plan for one to try to adjust himself to such new conditions rather than fight them; and better still, by looking ahead, to see the conditions and do the adjusting before they arrive.

*

A GOOD friend says he regrets that the farmers of the country do not take a more dignified way of making their wants regarding oleo known! With some people dignity becomes a disease. It would probably please the politician better if the farmer would take off his hat and stammer out a half-hearted request for a vote in favor of the anti-oleo bill; according to some standards that might be dignified, but the farmers know that it digs up very few votes. We admit that it will take most of the dignity out of an oleo Congressman to plaster him from head to foot with postage stamps, but he may bring it back with interest if he will support the bill.

*

WE have referred to the future of the automobile as a farm machine. We learn of cases where these vehicles, after doing their work on the road, have been used for turning farm machinery by raising the hind axle and running a belt from the wheel. The makers of automobiles, with one exception, discourage such double work. They say that the auto was made for speed and light travel—not for work that should be done by an engine costing less than one-fourth as much. As well put a light, swift trotter on the plow or heavy wagon when a stout heavy horse will do such work much better. It seems true that the present autos are not well fitted for farm use.

*

THE present high prices for grain come hard on the man with idle horses to feed. The cow gives her daily mess of milk and we feel that we are receiving immediate returns for the money spent for grain. With the horse we must often wait weeks or months for our return, and then receive it indirectly, often through the cow, sheep or hog! That is no reason why the horse should be starved, for we must keep him in good condition through the Winter if we expect him to do our work in the Spring. We must, however, feed him a less expensive grain than oats if we can find a grain that will keep him in good spirits for less money! We are gathering facts from horse feeders and would like to have *your* experience. What is the cheapest horse dinner at your barn boarding house?

*

WHAT is the value of a five-year-old child? In New Jersey the courts held that one dollar was fair value for a child that was killed by a trolley car. The plea was that the child had no earning capacity, and hence had no pecunary value to its parents! In New York City a jury allowed $300 for a little child killed by a cable car. The judge set this verdict aside. He said that the funeral and other necessary expenses cost $181, which would leave a trifle over $100 as the price of a human life! This, he said, was so low as to shock the moral sense. It is said to be almost impossible to obtain anything like a fair verdict for damages against one of the larger transportation companies in the great cities. As a rule they enjoy franchises which the people have given them, and which are worth millions. Yet, they will fight the payment of just damages in case of an accident with every trick and quibble of the law.

*

PRESIDENT Roosevelt in his message to Congress argues strongly in favor of Government irrigation of the arid lands of the Far West. In this he takes direct issue with the National Grange and the vast majority of farmers east of the Mississippi River. As most of our readers know, there are great tracts of desert land in the Far West where the rainfall is so scanty that cultivated crops will not grow without irrigation. Some of these lands are sterile or clogged with alkali, but if water were available for irrigation millions of acres would become productive. Through these lands run streams of good size, and irrigation is followed to some extent along the borders of these streams. If the water could be held back in storage reservoirs in the mountains and applied systematically to the land the area under irrigation would be vastly increased. The President favors the construction of such reservoirs at public expense, and, as we have said, thus places himself in direct opposition to the expressed wishes of a large majority of American farmers. If this land were actually needed by any generation now in sight there might be an excuse for some such scheme. Farm lands in the older settled parts of the country are now cheap enough—far cheaper in fact than good land would be on these irrigated plains. Those who desire farms can now obtain them, and we submit that it is far better from all points of view to repopulate and revive our present agricultural communities before we jump across the continent to build new ones. The opening of this arid land to productive culture would flood the country with food products far in excess of our present needs. That would mean further depreciation of our eastern farm lands which are now gaining in value. The building of these reservoirs and the sale or disposal of the irrigated lands would give occasion for one of the greatest political "jobs" in the world's history. The chances are that in the end the greater part of the lands would be controlled by great corporations, thus bringing the direct competition of the trust into the business of farming. For these and other reasons THE R. N.-Y. opposes Government irrigation—but chiefly because it is not necessary. We shall do our best to argue the matter in a fair and conservative way.

*

THE latest agricultural "fake" is the story of an Italian in New Jersey who tapped a trolley line and applied the electricity to his garden. It was said that he had "a vast net-work of wires" running all through the ground. According to the tale the trolley cars lagged, but the cabbage and potatoes jumped three weeks ahead of those in other gardens! People who would be tempted to take a nap if you talked the principles of plain agriculture to them jump at this story as a sure cure for their troubles. For example here is part of a note from New Hampshire:

> Give us the cost of any old dynamos and fixtures suitable for water power. There are hundreds of brooks among our New Hampshire hills that are murmuring and shouting to work for us farmers; gurgling and singing to grab the lightning and fling it into these rocky fields if that is the stuff which corn and onions want for dinner.

Investigation of the case mentioned shows that there is no trolley within three miles of the farm mentioned. The "electricity" used by the Italian seems to have been generated by a mixture of elbow grease and brain sweat! It is safe to say that there is at present no practical way of utilizing electricity to promote plant growth. That it will do this under ideal conditions seems to be demonstrated by experiments in greenhouse culture. We feel quite confident that some day the electric current will be used in a practical way for obtaining fertilizer nitrogen from the air. At present its use for agriculture appears to be limited to lighting, heating and providing power.

*

BREVITIES.

Let's be loyal to our calling,
Thus may we make farming pay,
So spell out your agriculture
With your very biggest A.

BOILED oats for the colt—page 850.

ARE hide growers joining the Free Hide League?

CUT hay early for cow feed—later for horse or market.

HOW would you like to be a Kansas natural-gas farmer?

IT is given to every man to live so that he need never fear the face of any other.

PROF. C. L. BEACH (page 851) found too much fat in the skim-milk. How the true "separator" did shake the fat out of its rival's work!

THE woodpecker has an elongated tongue with barbs at the end. We meet people who appear to have tongues of the same variety, but they use them to destroy characters rather than caterpillars.

A DISTINGUISHED entomologist says that the native New Jersey mosquito does not bite. Jerseymen should get out Federal injunctions compelling other States to keep their venomous insects at home.

OWING to delay in obtaining an engraving, the article on Mr. Mapes's plan of feeding hens will be held until next week. His conclusions will probably startle many good hen men.

LAST week we described a new plan for warming a henhouse. Mr. Mapes writes that he recently tested the device on a very cold night. The mercury stood at seven degrees below zero out doors and at 43 in the hen roost!

THE sugar refiners are said to be making overtures to the fruit growers in their efforts to obtain a repeal of the duties on raw sugar. They point out the fact that cheap sugar means an increase in the preserving industry, and a larger outlet for fruit. Beet sugar seems to have a chastening effect on the aforetime haughty sugar octopus.

SLIPPERY pavements in cities make poor footing for draft horses, and we frequently see them fall so heavily that it seems as though bones must be broken. The animals, often fine specimens of horseflesh, know their helplessness, and usually lie still until the harness is loosened. Then they scramble to their feet and go on as though nothing had happened, but there is no doubt that they carry lame spots for several days as a result. The look of fear on the face of one of these big horses when he feels that he is losing his footing and is about to fall, is pitiful. Many unnecessary accidents of this kind are caused by drivers who carelessly drive on dangerous places.

Events of the Week

DOMESTIC.—The range country for many miles northwest of Chadron, Neb., has been swept by a great prairie fire. The grass and weeds by reason of drought had become as dry as tinder, and when they were accidentally ignited the flames rushed across the prairie with great velocity. Live stock and flocks were driven from the path of the flames as fast as possible. The damage to the range has been very great, but very little stock is reported as lost. . . . . A despatch from Engle, N. M., says that oil borers have struck an artesian well at a depth of 200 feet which swept 1,000 gallons per hour through a two-inch hole. Engle is in the heart of the famous Journey of Death Desert, one of the most arid regions known, and the strike of water will prove far more valuable than an oil gusher. During the Mexican War out of a column of 165 soldiers, who attempted to cross the desert, all but 14 perished. Great excitement has been created by the strike. . . . The William McKinley National Memorial Arch Association has determined to change its plan of operation so as to appeal to Congress instead of to the public for the erection of the proposed McKinley memorial at Washington. . . . The State of Michigan has instituted proceedings against the A. Booth Packing Company, of Chicago, to enforce the penalty of $1,100 per month for six years for the company's failure to file articles of incorporation in this State and pay the franchise fees. The fine, if imposed at this rate, will amount to $79,200. The action resulted from the discovery that it was impossible to make proper service against the company in Michigan on counts of alleged illegal fishing. . . . . C. S. Hurter, Dominion Government metallurgist at Vancouver, states that among the millions of dollars worth of Yukon gold brought to him for purchase by the Government this season there was an abundance of platinum unknown to the miners. Hundreds of little nuggets of platinum were mixed with the coarse gold. Mr. Hurter declares that the miners of the Yukon have been throwing away thousands of dollars' worth of platinum daily. The Dominion Government is sending an expert to the Klondike to investigate.

CONGRESS.—In the executive session of the Senate, December 4, the new Hay-Pauncefote treaty was received and referred without comment to the Committee on Foreign Relations. . . . . Senator Jones, of Arkansas, introduced, December 4, without amendment the Anti-Trust bill which passed the House during the last session of Congress, but failed to pass the Senate. . . . Mr. Pearre, of Maryland, has introduced in the House a bill directing the suspension of tariff duties upon imports when their sale or manufacture is monopolized. . . . The report of the Isthmian Canal Commission was sent to Congress December 4. It says the Commission is of opinion that the most practicable and feasible route for the canal is by way of Nicaragua. Two bills providing for the construction of the canal were introduced in Congress December 4. . . . . In the Senate, December 5, Mr. McComas, of Maryland, made an extended speech on the subject of anarchy and the punishment of anarchist assassins, and was followed by Mr. Hoar, of Massachusetts, on the difficulties in the way of dealing with such criminals. The most effective remedy, he suggested, would be to have the civilized nations of the world agree upon some isolated spot to which all anarchists who upheld assassination or the overthrow of government should be transported. . . . . Senator Penrose, December 5, introduced in the Senate a bill for the regulation of immigration prepared by himself and the Commissioner-General of Immigration. The measure provides for a duty of $3 per head on all persons coming into the United States from foreign countries, except those who are citizens of this country or of Canada or Mexico, the fund thus raised to be applied to the payment of expenses incident to the regulation of immigration. . . . . Senator Depew introduced a bill in the Senate December 9 to establish the University of the United States. It will be for post-graduate work, and make use of the Government scientific collections, libraries and laboratories. It is reported that Andrew Carnegie is to make a gift of $10,000,000 to carry on the work, and a message from the President on this subject is expected shortly. . . . . The Senators and Representatives interested in the legislation for the irrigation of arid lands have determined to make the Hansbrough-Newlands bill the basis of action. It provides that the proceeds of the sales of public lands shall be set aside as a fund for arid land reclamation and irrigation. . . . . As the time approaches for final action on the Isthmian Canal project the complications begin to make their appearance. It is now asserted that before the United States can acquire the right to construct the canal a bargain must first be made with the Maritime Canal Company of Nicaragua, a New Jersey corporation, which claims to have spent $1,172,000 for lands and concessions along the proposed Nicaragua route. This company claims to own every foot of land between the Pacific and Lake Nicaragua. The supposition on the imperfect information attainable here is that this company is a successor of the Eyre-Cragin syndicate, which forfeited its concession after paying $100 000 and failing in October, 1900, to pay a further amount of $400,000. . . . . Senator Morgan introduced, December 10, a bill providing $180,000,000 for the construction of the Nicaragua Canal, of which $5,000,000 is made immediately available, and of which aggregate sum such amounts as are necessary are to be appropriated by Congress from time to time. The control of the canal and of the canal belt is vested in a board of eight citizens of the United States, in addition to the Secretary of War, who is to be president each member of the board to be paid $8,000 a year and to be chosen regardless of political affiliation. There is a provision authorizing the establishment of a regiment from the regular army on the canal belt to guard it properly, and courts also are authorized conformable to the powers granted by the governments of Nicaragua and Costa Rica. There is also a provision making three divisions of the canal during the construction, and there is to be a chief engineer and two assistants on each division, the chief to receive $6,000 a year and the assistants $3,000.

PHILIPPINES.—A member of Congress, who has just returned from the Philippines, has brought back a copy of the civilian pay roll at Manila. He insists that it shows great extravagance on the part of this Government, and that Congress should prune the list The civilian salary rolls at Manila carry 4,606 names of Americans and Filipinos, who draw an aggregate annual stipend from the Government of $3,086,989. Of these, 2,044 are Americans, whose yearly compensation foots up $2,280,044. There are 2,562 Filipinos, all with a few exceptions occupying minor places, which yield a total of $806,945 to the incumbents. Following is a list of some of the salaries paid to civilian officers: Governor Taft President of Commission, $20,000; each of four Commissioners, $15,000; secretary to the Commission, $7,500; Chief Justice, a Filipino, $7,500; six Justices, two of them Filipinos, $7,000; Treasurer, $6,000; Auditor, $6,000; Collector of Customs, $6,000; head of Department of Post, $6,000; Chief of Educational Bureau, $6,000; Chief of Health Bureau, $6,000; Attorney-General, $5,500. Up to September 1 last, Governor Taft was receiving $12,000 annually and $15 per diem. After that date his salary was fixed at $5,000 a year as Commissioner and $15,000 additional as the head of a bureau. His other colleagues on the Commission also are paid $5,000 a year as members of the Commission and $10,000 more each as heads of bureaus. Their compensation therefore is $15,000 annually. . . . . After leading a band of rebels for two years, during which period he used his knowledge of the methods of the Americans to great advantage, David Fagin, a negro who deserted from the Twenty-fourth Infantry (colored), has been killed by native scouts near Bangabon, Province of Nueva Ecija. A number of serious ambushes into which the American troops were led are known to have been the work of Fagin, and in many instances he is said to have ordered the assassination of prisoners who had fallen in his hands. . . . . The American and Fusion Federals elected their full ticket at the local elections held in Iloilo, Island of Panay. The constitutional code, allowing soldiers to vote, played an important part in the elections. . . . . Thousands of people are leaving Batangas Province for places of safety. Gen James M. Bell reports an important engagement between a force of insurgents at Labo, Province of Camarines, and a detachment of the Twentieth Infantry. Three Americans were killed. The loss of the enemy is not known, but is believed to have been heavy. Gen. Bell anticipates a speedy extermination of the irreconcilables. A large force of insurgents recently attacked the town of Lipa, Province of Batangas, killing one soldier and several Americanistas. Troop F, First Cavalry, killed 10 of the enemy before the remainder of the insurgent force escaped. The natives are stirred by the closing of the ports, and bitterly object to reconcentration. A Filipino force, consisting of 200 riflemen and 400 bolomen, recently attacked Nagpartian, Province of North Ilocos. Company M, Eighth Infantry, acting on the defensive, drove off the enemy, killing 11 of them, with no loss to themselves.

FARM AND GARDEN.—Orlando Harrison, president of the Peninsula Horticultural Society of Berlin, Md., who has spent his past life in horticulture, has engaged some of the best men in the country to talk on different subjects at their meeting to be held at Berlin, Worcester Co., Md., January 8-9-10. All horticulturists and agriculturists are invited.

Professor F. Lamson Scribner, the agrostologist of the Department of Agriculture, has been appointed Chief of the Insular Bureau of Agriculture in the Philippines.

The Pennsylvania Dairy Union has elected the following officers: President, William F. McSparran, Furniss; first vice-president, A. Leonard, Troy; second vice-president, W. E. Perban, Niagara; treasurer, S. F. Barber, Harrisburg; secretary, H. Hayward, State College directors, Henry W. Comfort, Bucks County; J. P. Sharpless, Chester County; C. L. Peck, Coudersport; S. J. McCoy, Elk City; E. P. Forney, Hanover. Secretary of Agriculture Hamilton demanded that the report of the Committee on Resolutions, which reflected upon his administration, be amended, and insisted that his department had performed it full duty to the dairymen.

The Secretary of Agriculture has designated Professor W. M. Hays, of the Minnesota State Agricultural College and Experiment Station in the Bureau of Plant Industry, to direct the work in organizing the State experiment stations in the middle Northwest, Minnesota, the Dakotas, Iowa and Wisconsin, into a coöperative union for improving the yield and quality of wheat and other grains, grasses, clovers and field roots.

Many prominent cheese makers from the counties of Brown, Calumet, Sheyboygan and Manitowoc met at Manitowoc, Wis., December 1. The object of the meeting was to solidify an organization—the Wisconsin Protective Cheese Manufacturers' and Buyers' Association—the purpose of which shall be the protection of cheese manufacturers and dealers throughout the State against frauds in adulteration of milk and cheese, also the encouragement of the manufacture of a more uniform and better grade of cheese in the counties above named, and a building up of a better market for the same The system used in this section in making cheese is the "ten to one," and the Babcock test was advocated.

The Northern Illinois Horticultural Society, in session at Dixon, elected the following officers for the ensuing year: President, J. F. Thompson, Marengo; vice-presidents, J. L. Hartwell, Dixon; A. D. Havenhill, Fox, and L. H. Cutler, East Dubuque; secretary, J. Friend. Nokomi; treasurer, Charles Hey, Dixon. Mr. Hey declined the office of treasurer and S. G. Soverhill, of Tiskilwa, was elected.

A report just issued by the Kansas State Agricultural Department places the total value of all farm products and live stock in the State last year at $350,000,000, an increase of $17,000,000 over last year. The total increase in two years is $45,000,000.

The Connecticut State Board of Agriculture held its annual meeting at Bridgeport December 17-19.

The Pennsylvania State Horticultural Association will meet at Bloomsburg January 14-15, 1902. A large attendance is expected.

The Wayne Co. (N. Y.) Fruit Growers' Association met at Newark, N. Y., December 11.

WAYNE CO. (N. Y.) GRANGE.

Waynes County (N. Y.) Pomona Grange held a two-days' session at Newark December 3-4. In spite of the disagreeable weather the attendance was good. The first day was occupied with election of officers and delegates to the State Grange, as follows: Officers: Master, E. P. Taylor, Lyons; overseer, G. P. Norton, Ontario; lecturer, Mrs. E. B. Norris, Sodus; steward, O. M. Lincoln, Newark; assistant steward, J. O. Wadsworth, Wolcott; chaplain, E. H. Clark, Palmyra; treasurer, D. A. Emeigh, Clyde; secretary, Mrs. B. S. Durfee. Macedon; gatekeeper, C. F. Swezey, Marion; Pomona, Mrs. P. S. Aldrich, Palmyra; Flora, Mrs. J. H. L. Roe, Wolcott; Ceres, Mrs. W. P. Rogers, Williamson; lady assistant steward, Mrs. F. A. See, Newark; member executive committee, Abram Garlock, Newark. Delegates to State Grange: E. P. Taylor, Lyons; Frank A. See, Newark; Mrs. F. H. Tuttle, Walworth; T. J. Bridges, Macedon; Mrs. D. A. Emeigh, Clyde; H. R. Paddock, Wolcott; Mrs. W. P. Rogers, Williamson; Rowland Robinson. Sodus; Mrs. G. W. Sweezey, Marion, and Edward Harrison, Lakeside.

At the morning session on Wednesday, the fifth degree was conferred in full form on a class of 10, making a membership of 325. Hon. T. W. Collins, of Lyons, introduced a resolution calling upon our representative to favor the Oleomargarine bill and oppose the Ship Subsidy and Irrigation bills. C. E. Clark introduced a resolution, asking Speaker Henderson to appoint some other person than James W. Wadsworth as chairman of the Committee on Agriculture. At the afternoon public session, assessment and taxation were discussed, and the accompanying answers made to the following questions sent out by the State Grange:

1.—If taxation is necessary for the enforcement of laws for the protection of property, individual or corporate; should any kind of property, either real or personal, which is protected by law, be exempt from taxation? No.

2.—Do you approve of exempting mortgages from taxation? No.

3.—Can you cite any case where bankers, loan associations or individuals have ever offered to loan money at any lower rate per cent on account of exemption from taxation? No.

4.—If personal property is entitled to exemption from taxation on account of the indebtedness of the owner thereof, why is not real estate entitled to the same exemption? It is.

5.—If one-half the property of the State be exempted from taxation, how much does it increase the rate per cent upon the remainder? 100 per cent

6.—Do you approve of taxing mortgages only by taxing real estate and requiring the mortgagee to pay such proportion of taxes as his mortgage value is to the land value, thereby dividing the land tax between owner and mortgagee? Yes.

7.—Do you approve of the State taxing mortgages for State revenue, and exempting them from local taxation? No.

8.—Do you approve of the State taxing mortgages for State revenue, while they are still taxable for local purposes? Yes.

9.—Do you approve of the State taxing corporations for all needed revenue, thereby relieving the individual citizen from all State taxes and exempting said corporations from local taxation? No.

10.—Do you approve of the State taxing corporations for all needed revenue, thereby relieving individual citizens from all State taxes and not exempting said corporations from local taxation? No. C. E. CLARK.

LICK A STAMP FOR BOSSY AND THE BABY.

Last week we printed a list of New York State Congressmen who are supported or elected by farmers. We wrote each one a personal letter asking him respectfully to use his best energies to help push the oleo bill through the House. Here are the answers received to date:

In regard to the oleomargarine bill introduced by Congressman Tawney, of Minnesota, it will give me great pleasure to take this matter into consideration, and if I find this bill will be of advantage to the farmers of our State, I shall certainly do all in my power to aid in the passage of the measure. C. A. PUGSLEY.

I shall be in favor of the Tawney Oleomargarine bill. JOHN K. STEWART.

I will surely support and vote for the Tawney Oleomargarine bill, at this session of Congress. A. S. TOMPKINS.

I shall be in favor of the Tawney Oleomargarine bill. J. S. SHERMAN.

I shall be in favor of the Tawney Oleomargarine bill. L. W. EWING.

I am heartily in favor of the Grout Oleomargarine bill and always have been. Shall do all I can to further it. GEO. W. RAY.

Your letter received and the subject will have early consideration. S. E. PAYNE.

I have not yet seen Mr. Tawney's bill, but I supported the Grout bill in the last Congress and favor its provisions now. M. E. DRISCOLL.

I have not examined Mr. Tawney's bill I think the Grout bill was favored by most of the farmers of my district, and for that reason I should vote in favor of a measure that sought to accomplish the same results. J. R. PERKINS.

I shall keep your letter on file and will give the same careful consideration when this measure comes before the House. W. H. RYAN.

It will be seen that the majority of these men favor the bill and will vote for it. Let us waste no stamps on them except to thank them for taking the position they do. Messrs. Pugsley, Payne and Ryan evidently need a few stamps. We appreciate the fact that they are going to "consider" the bill, but what we want them to do is to *vote* for it. Mr. Pugsley, for example, isn't quite sure that the bill will be of advantage to the farmers. Who is to change his mind? The farmers themselves. How are they to do it? The glue on a postage stamp will stick many an idea to a Congressman!

Woman and Home

From Day to Day.

IF SANDY CLAWS WAS PA.

I've often thought what fun 't would be
If Sandy Claws was pa.
He surely would be good to me,
If Sandy Claws was pa.
He'd let me see the million toys
He makes fer little girls an' boys;
An' every single Winter's day
I'd ketch on to the reindeer sleigh,
An' he'd be good an' wouldn't mind,
But jes p'tend that he was blind,
An' wouldn't never *whip behind*,
If Sandy Claws was pa.

The reindeer'd takes us 'way up high,
If Sandy Claws was pa,
They'd trot right through the air an' sky,
If Sandy Claws was pa.
An' pa would tell me how the deer
Could do a thing so awful queer,
An' why tney stay up in the air
Without balloons to keep 'em there;
He'd tell me how they fly all night
Up past the stars so big an' bright,
Without a single wing in sight,
If Sandy Claws was pa.

The pole explorers would be blue,
If Sandy Claws was pa.
We'd find the pole before they do,
If Sandy Claws was pa.
Fer we'd go there jes like a streak;
It wouldn't take us half a week
To make the trip, ner half a day,
Ner half a night while on the way.
It's great ole time them reindeer make
When their slim legs gits wide awake—
Not half a hour it wouldn't take,
If Sandy Claws was pa.

Each night there'd be a Christmas tree,
If Sandy Claws was pa.
An' one each day, besides, fer me,
If Sandy Claws was pa.
He'd tell me how he climbs right down
The red-hot chimbleys in the town.
An' how he ever, ever learnt
To never git his whiskers burnt.
But what's the use of thinkin' so?
These dreams is nice, but they don't go,
Fer pa ain't Sandy Claws, you know,
An' Sandy Claws ain't pa.

—Century Magazine for December.

*

We heard recently of a school teacher who tried, on her first day with the second grade, to gain the children's interest by questioning them as to what they already knew. Some of their explanations were a trifle unexpected.

"Now, who knows what a skeleton is?" asked the teacher, smiling coaxingly.

The little girl wearing the pink gingham apron and occupying the back seat waved her hand wildly and worked her mouth in frantic endeavor to get "teacher" to look at her.

"Well, what is it?"

"A skeleton," said the tot, twisting her apron in her fingers, "is a man who has his insides outside and his outsides off."

*

This season women's jackets are usually finished with a velvet collar—often with cuffs and revers of velvet, and when black or dark colored the dye rubs off the velvet in a most exasperating manner, smudging light-colored stocks or waists distressingly. One of life's little mysteries is the reason why such dye parts so willingly from the original fabric, and then refuses to move afterwards when its presence is undesired. A tailor tells us, however, that steaming the new velvet will prevent the color from rubbing off. A hot flatiron is rested up on its end, and a damp cloth put over it; the velvet is held in the steam until wet, and then brushed well with a soft hat brush. After the fabric is dry, it is treated to a second steam bath, and there will be no further trouble with the color rubbing off. A similar flatiron steam bath, applied to the under side, is our plan for renovating crushed or wrinkled velvet.

*

A small girl of our acquaintance, discoursing recently about Christmas, observed that her chum Lenore still believed that there was a truly Santa Claus. "I haven't believed in Santa Claus for years and years," continued Inez, she having reached the ripe age of 10.

"And did you tell Lenore that you don't?" we asked.

"Oh no," said Inez, in a shocked tone. "I think it's wicked to stop people from believing things that make them happy."

There is a good deal of Christmas philosophy in the little girl's opinion.

3971 Child's Costume, 4 to 10 yrs.

Most of us are foot passengers in a working world; there is no great destiny before us, and the plain and homely surroundings of our busy lives show nothing heroic, or romantic, or picturesque. We are the privates who march in the ranks. And yet, without building idle castles in Spain, and mourning because we can't live in them afterwards, it is possible to believe in a good many things that will make such lives happy. Perhaps some one who reads this looks forward to a Christmas from which necessity has stripped the customary gifts—a Lenten festival, bare of its traditional good cheer. Francois Coppée, the French poet, tells an old legend of a little orphan who, hearing of the gifts anticipated by his companions, determined to place his sabots by the fireplace on Christmas Eve, in full faith that Noel, the French Santa Claus, would fill them with gifts. But, as he left the church, after midnight mass, he saw, lying asleep in the porch, a carpenter's boy, his bag of tools by his side, and his bare feet exposed to the nipping frost. The orphan paused in pity of one poorer than himself, then, drawing off his sabots, slipped them on the feet of the sleeping stranger, and limped home barefooted through the snow. Reaching his poor room he cried himself to sleep, because he had not even the sabots to hold the gifts of Noel. But, in the morning, he saw, by the empty fireplace, his old sabots, piled high with gifts, while throughout the village the people talked eagerly of a miracle—a golden crown showing in the time-worn pavement of the church porch. The orphan had placed his sabots—all he had to bestow—upon the sacred feet of the Child of Bethlehem.

Whatever our private or personal beliefs—whether we welcome Christmas festivities or turn away from them like the sad-visaged Puritans—we are all alike the better for public recognition of a season of peace and good will. If our purses are light, there is all the more reason to make our hearts correspond with them. After all, being happy is largely a question of habit; not so easily acquired, perhaps, as a habit of looking on the dark side, but none the less a matter of personal choice. If we can't get what we like, we may at least like what we can get, and that cheery philosophy will spread a spirit of Christmas joy over every month in the year.

The Rural Patterns.

The kilted suit shown is made of blue serge, with collar, tie and shield of red cloth trimmed with narrow black braid; but white, dark red, green, brown and fancy plaids are all used, and flannel, cashmere and similar wool goods are appropriate. The skirt is laid in backward turning pleats from each side of the front to the center back where they meet. The upper edge is stitched to a body lining, that closes with the skirt at the back, over the front of which the shield is applied and which is finished with a standing collar at the neck. The blouse is made separately and in double-breasted style, closing at the edge of the box pleats. The back is laid in two box pleats and the fronts in one each, while the neck is cut away to reveal the shield and is finished with a sailor collar. The sleeves are full, and gathered into narrow cuffs, or bands, at the wrists. To cut this costume for a girl of six years of age five yards of material 27 inches wide or 3¼ yards 44 inches wide will be required, with ⅝ yard 27 inches wide or ½ yard 44 inches wide for collar, shield and tie. The pattern No. 3971 is cut in sizes for children of 4, 6, 8 and 10 years of age; price 10 cents.

Loose three-quarter coats are very desirable for children. In the model shown, the fronts are cut in box style and hang free from the shoulders, but the back includes a center seam. To the neck is joined a sailor collar, that is square at the back, but rounded over the fronts, which are cut away to close closely to the neck, where there is a simple turnover collar that is seamed to both the coat and the sailor collar. The sleeves are in regulation style and pockets, with pocket laps, are inserted in each front. The coat is closed, in double-breasted style, with handsome pearl buttons and buttonholes. To cut this coat for a child of four years of age 3⅝ yards of material 20 inches wide, 2⅞ yards 27 inches wide, 1⅝ yard 44 inches wide or 1½ yard 54 inches wide will be required. The pattern No. 3984 is cut in sizes for children of 2, 4, 6 and 8 years of age; price 10 cents from this office.

3984 Child's Three-quarter Coat, 2 to 8 yrs.

TRY GRAIN-O! TRY GRAIN-O!

Ask your Grocer to-day to show you a package of GRAIN-O, the new food drink that takes the place of coffee. The children may drink it without injury as well as the adult. All who try it, like it. GRAIN-O has that rich seal brown of Mocha or Java, but it is made from pure grains, and the most delicate stomach receives it without distress. ¼ the price of coffee 15c. and 25c per package. Sold by all grocers

A Wooden Washer works hard, rubs and destroys clothing, leaks and falls apart, is heavy and awkward to handle.
A Steel Washer—galvanized—never rusts, never leaks, never falls apart, is cleanly and will last a lifetime. That is why the

Syracuse Easy Washer

is made of steel. It is **easy to operate**, because it washes by air pressure. Air forces soap and water through the clothes and takes out the dirt. No rubbing on washboards, no wood or metal pegs to destroy clothes, as in other machines, but simply air pressure, without hard work, without friction, wear or waste, making washing easy.
It washes fast, washes clean, washes everything. It is on rollers to move about easily.
Thousands in use, each one a testimonial.
You take no risk on the EASY washer. **Try it four weeks,** then **return it if you wish.** Write for full information.

DODGE & ZUILL, 539 S. Clinton St., Syracuse, N. Y.

A Brick Bake Oven.

THE FIRST-PRIZE WINNER IN OUR PHOTOGRAPHIC COMPETITION.

The picture shown on our first page, Fig. 383, received first prize in the recent photographic competition. It is needless to enlarge upon the beauty of the photograph, for that is fully shown in the engraving. The first qualities that strike us in the picture are the skill of the grouping and the sentiment displayed, the latter quality being, from an artist's standpoint, too often missing from a photograph. The shining milk pails, the clump of hollyhocks, and the plump little maid with the cushiony loaf, would bring back recollections of wholesome country living to many who have drifted far from the soil. The sender of the photograph, Mrs. S. J. Perry, of Michigan, has this to say of it:

"Such a brick bake oven is used in Ohio and Pennsylvania for baking bread, pies, cakes and cookies. A fire is built inside of dry hard wood, and left to burn to coals; then raked out and a wet mop used to clean out the ashes. The large loaves of bread go in first, then pies, cakes and cookies. Bread requires but one hour to bake, and other things less. In fruit time large board trays are filled with apples or peaches sliced, or any fruit one wishes to dry, and put in after the bread is out. The door is closed and the fruit left until next day, when it is generally dry enough to put away. The bread is fine-flavored, and in generous-sized loaves as you can see. Eight to 10 loaves, half a dozen pies, cake, biscuit, etc., are generally a baking. The Pennsylvania Dutch know well how to make such things."

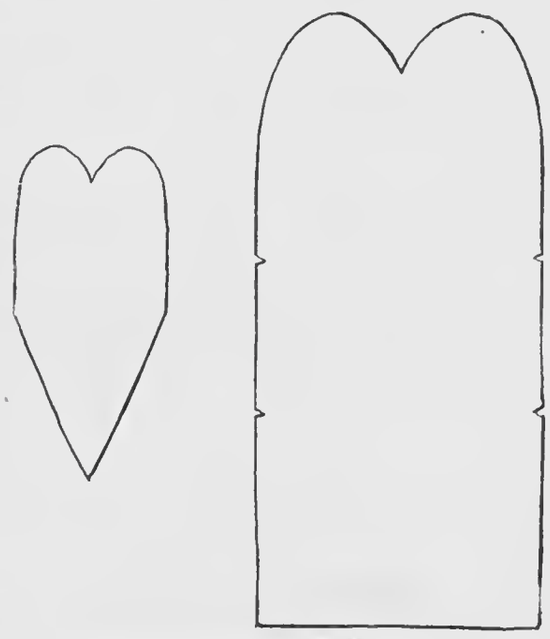
Christmas Holly.

Readers of THE R. N.-Y. may wish to know more of the holly they see at Christmas. Some of the best comes from Delaware. Late in November and early December is a season of activity to a number of holly workers. It grows in the woods and damp places; is a tree, when at its best. The most beautiful holly has a thick, waxy dark-green leaf, edged with sharp thorns. It bears bunches of bright scarlet berries, smooth and shiny. They ship small branches of leaves and berries in boxes or cases. This is called loose holly by the trade. Crosses and anchors are made in various ways; one style by wiring twigs of green and bunches of berries to wooden forms; another by the tacking of each leaf and sprig of berries to flat wooden cross or anchor. While the latter is pretty, the former is the more natural looking. Men, women and children go holly hunting, on foot and with team; sometimes go miles. Reckless, greedy gatherers will cut down trees or cut the limbs and top; leaving the poor denuded stump to testify to their meanness. Others clip twigs, leaving the tree to bear a crop for next year. Some steal, some beg; others buy. Holly has a money value; so have potatoes; why steal more of one than the other? The twigs are carried home in bags. Often the wreath-maker has helpers. The husband or children will "trim" for her. Bad leaves, and extra leaves are clipped off. The hoop is made of a switch bent, tacked and tied, or wired. The maker has spooled the wrapping wire upon a small stick; taking the hoop in her lap, placing some twigs upon it, she holds them with the left hand, while she wires them round and round with the right. The berries have been freed from the leaves and tied into bunches; one of these is wrapped on to the hoop as often as the maker chooses. Five to the wreath, if a small one, is the common arrangement. Wreath making is not play. Considerable strength is required for good work, and the hands are continually coming in contact with the sharp holly points. Many a child has warmer clothing or an extra Christmas gift due to holly work. Each year finds it scarcer than before, and will increase the cost of decoration. It is a pity to rob the trees of their beauty! Upon a background or carpet of snow the dark-green leaves and bright berries are a beautiful sight to the eyes of a lover of nature's handiwork. Nevertheless, it would give me joy to transplant some of them in their brightest beauty, where the city people could enjoy them in their perfection of loveliness. Each wreath or sprig of holly could tell you of your fellow beings in the country if it could speak. Some holly buyers see only dollars and cents in holly from first to last; others see beauty all the way, though money be the object for which they labor. No, not money but what money will buy. LUCY E. HORTON.

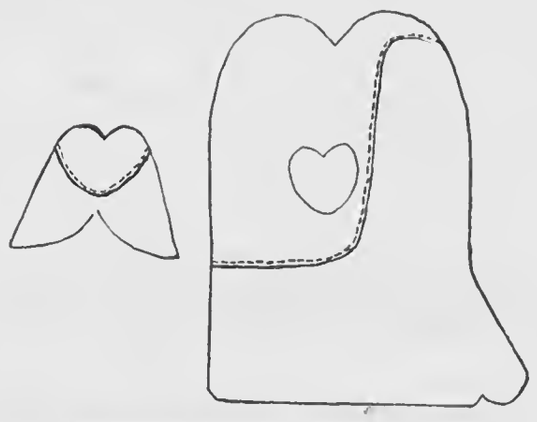
MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

Homemade Mittens.

Jack Frost is with us once again, and there is a general demand for mittens, large and small; and in one home at least there is no lack, although there is not a good knitter in the family—not one who has ever mastered the art of knitting to such an extent as to be able to knit and read at the same time, as Grandmother used to do. As the reading must not be neglected, the sewing machine is pressed into the service with very satisfactory results, turning out mittens at a rate that would astonish the housekeepers of "ye olden time." For the men, who work all Winter with their mittens on, and must therefore have such as are warm, pliable and durable, we make them of heavy denim or duck, and line them with old knit under-



CHILD'S STOCKINET MITTEN. FIG. 388.



MAN'S WORKING MITTEN. FIG. 389.

wear. These are so cheap, and quickly made, that to mend them would be a waste of time. The hands are made double as shown by dotted line in Fig. 389; being applied on the outside, when the "hand" wears through, it is ripped off; and this is all the mending they ever get. Made of wool goods (a piece of an old coat for instance) with the backs nicely stitched, they are very neat; and one pair, made from some pieces of an old fur cape, with calfskin hands, is quite fine, and just the thing for driving. The little boys have each a pair made of astrachan, lined with eiderdown, and finished around the tops with fur.

For Spring and Fall wear, we omit the lining; and for the children, very good ones are made from pieces of their old bicycle hose, (there is usually a little left between the knee and ankle) cutting them as shown in Fig. 388. They will wear these cotton mittens—thus preventing chapped hands—when woolen ones would be too warm. Now I imagine some sister holds up her hands in holy horror, and exclaims: "How shiftless!" But I deny the charge. Only those who cling to Grandmother's ways are shiftless; and if some one can suggest a better way I am ready to shift about at any time. MARION LAWRENCE.

Rural Recipes.

In Maryland we're happy—
The nor'west breezes pipe;
The canvasback is blooming
And the terrapin is ripe.
The hardshell crab is tempting
The jaded appetite;
The oyster makes us joyous—
The world is running right.
—Baltimore American.

Raisin Gingerbread Without Eggs.—One cupful brown sugar, one-third of a cupful of shortening (part butter and part nice beef suet), one cupful of molasses, two-thirds of a cupful of buttermilk, three cupfuls of flour, one cupful of seeded raisins, one rounding teaspoonful soda, one teaspoonful each of ginger and cinnamon, and one-third teaspoonful each of cloves and allspice. Bake in a shallow pan and eat warm.

Indian Pudding.—An old-fashioned apple Indian pudding, known to every one who remembers grandmother's cooking, calls for two quarts of milk, one cupful of molasses, one cupful of Indian meal, one tablespoonful of finely-chopped suet, two teaspoonfuls of salt and one quart of pared and quartered apples. Heat the milk in a double boiler, and when it boils pour it over the meal. Put the mixture in the double boiler and cook for three-quarters of an hour, stirring it often. Add the molasses, apples and suet and a half teaspoonful each of ginger and nutmeg. Butter the pudding dish, turn the batter into it and bake it in a slow oven for three hours. Serve it with cream. If butter is used in place of suet three tablespoonfuls will be required. Sweet apples are the best for this pudding.

WHAT'S IN A NAME?

Depends upon the name. Scott's Emulsion is a name that has value. Maybe it doesn't mean much to you—but to the consumptive who has been strengthened and fattened, to the sickly children who have received good health, to the weak mothers and babies who have grown strong—to these Scott's Emulsion means something.

To all of them it has meant an easy and natural return to health.

We'll send you a little to try, if you like.
SCOTT & BOWNE, 409 Pearl street, New York.

EVERY MAN
WOMAN AND CHILD

who suffers from

Rheumatism

should use

St. Jacobs Oil

It Conquers Pain, acts like magic, and has no equal on earth as a pain killer.

Price, 25c and 50c.

SOLD BY ALL DEALERS IN MEDICINE.

☞ Please tell what you wish to purchase.

BUSINESS BITS.

RIPLEY Hardware Co, Grafton, Ill., is looking for hustling agents and dealers to handle its compressed-air pumps. The Eclipse spraying outfit is on this list, which is one of the best made for orchard work.

THE Banner root cutter is one of those machines that it is extravagance to be without, for any farmer who feeds roots. It cuts the roots in very fine slices, and is equipped with a shaking device which removes all dirt or gravel before the roots reach the knives. Write O. E. Thompson & Sons, Ypsilanti, Mich., for copy of their handsome free catalogue.

THE Rife Hydraulic Engine seems to be the most effective outfit to insure a constant water supply. The manufacturers guarantee every machine to the extent that if after 30 days' trial any machine is not entirely satisfactory (no conditions attached), it may be returned and the money paid will be refunded, or, if rated, the engine will be shipped on 30 days' trial. Write Rife Engine Co., 22 Liberty St., New York, for catalogue and full particulars.

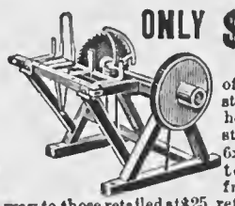
SPROUT, Waldron & Co., Muncy, Pa., are making some remarkably fine portable mills for use on farms. They grind all kinds of dairy feed and every kind of grain—oats, rye, corn, barley, provender, clover, hay, cornstalks, corn and cob—anything suited to live stock feeding. One of these mills will be sent to any responsible person for a free trial of 15 days. Or if you prefer to know more of them you may have a descriptive catalogue, free, by sending your name and address to Sprout, Waldron & Co., Muncy, Pa.

FLEMING'S Lump Jaw Cure, Fleming's Spavin Cure and Fleming's Fistula and Poll Evil Cure must be known by name at least to every reader, for these famous stock remedies are advertised in our columns. Fleming Bros., Union Stock Yards, Chicago, are eminent chemists who believe in a separate remedy for each class of disease they treat. The Lump Jaw Cure cures lump jaw, the Spavin Cure cures spavin, and the Fistula and Poll Evil Cure cures these diseases, so Fleming Bros. assert, and prove it by offering to refund all money paid if their medicine fails to cure.

Satisfactory Results.

Gentlemen: We inclose check to cover inclosed bill. We have had very satisfactory results from this quarter's advertising in THE R. N.-Y.. Your guarantee that those writing to advertisers in your paper will get quick reply and a square deal is valuable to your subscribers and advertisers. What we want is the confidence of the readers of THE R. N.-Y., and we merit it by guaranteeing our stock just as represented; if not satisfied it can be returned and we pay return charges.

Rosenvick, Pa. HAMILTON & CO.,



ONLY **$14.30** for our No. 12 tilting table wood saw, saws any kind of wood. The frame is made of seasoned oak, shaft of cold rolled steel. Castings and wrought iron parts heavy, braced extra well, making it stiff and strong. 95 lb bal. wheel. Pully 6x6 in. Wt. 320 lbs. **We guarantee** this machine to be the best saw frame made. If not found equal in every way to those retailed at $25, return at our expense. Price—24 in. saw **$5.75**; 26 in., **$6.70**; 28 in., **$7.65**; 30 in., **$8.60**. **Send for our Large Free Catalog**, it shows 8 styles saw machines. All sizes circular saws, lowest prices ever offered.

Sold to close estate. More land if desired. Possession any time. Good roads. Near "Peaks of Otter." Health of vicinity perfect. Water the very best. A bargain. Apply B. W. BOCOCK, Crystal, Va.

GLENN RANCH,

Glenn County, California,

FOR SALE IN SUBDIVISIONS.

This famous and well-known farm, the home of the late Dr. Glenn, "the wheat king," has been surveyed and subdivided. It is offered for sale in any sized government subdivision at remarkably low prices, and in no case, it is believed, exceeding what it is assessed for County and State taxation purposes.

This great ranch of 40,000 acres runs up and down the western bank of the Sacramento River for 15 miles. It is located in a region that has never lacked an ample rainfall, and no irrigation is required.

The river is navigable at all seasons of the year, and freight and trading boats make regular trips.

The closest personal inspection of the land by proposed purchasers is invited. Parties desiring to look at the land should go to Chico, California.

For further particulars and for maps, showing the subdivisions and prices per acre, address personally or by letter,

F. C. LUSK,

Agent of N. D. Rideout, Administrator of the Estate of H. J. Glenn, of Chico, Butte County, California.

Free Public Lands.

Free Homesteads Free Timber Lands Free Grazing Lands Free Mineral Lands Free Stone & Coal Lands	Located by Counties, and giving fullest information about free government lands and how to secure them.

100 pages packed full of information to Land Seekers.
A BILLION ACRES OPEN TO FREE ENTRY.

VACANT GOVERNMENT LANDS is the title of a new book just published giving the number of acres and the kind of land described that is open to settlement in each county of every public land State and Territory. The location of each land office to which applications are to be made, with blank form of application. It tells about irrigation and irrigated lands. About oil and saline lands. How to acquire townsites and millsites. With many diagrams and tables revised up to date. This book will be mailed to any address with six months' subscription to THE FARMER, St. Paul, Minn. The oldest and leading farm paper in the State, all for 25 cents.

Address, **WEBB PUBLISHING CO.,**

Horses, Cattle, Sheep and Swine

$2 Book for $1

We have yet some copies left of a lot of slightly shelf-soiled books of **Horses, Cattle, Sheep and Swine,** by Curtis, that we will mail postpaid as long as they last for $1. This book is the standard work on live stock. It is used as a text-book in almost all agricultural colleges, and is indorsed by all leading authorities on live stock. It is a large book, fully illustrated, and requires 16 cents to pay postage alone. These copies are in condition for any library, and will be reserved for subscribers alone. They will not be sent at this price to dealers. They are a great bargain at the price for anyone who wants to make a study of animal husbandry.

THE RURAL NEW-YORKER, NEW YORK.

10 Weeks for 10 Cents.

The time is nearly up for those 23 cash prizes that we have been talking about. The contest closes January 1. We have received clubs from every State in the Union, and Canada. The clubs are small, but we expected them to be; yet as a whole they count up into a great many names. We are, however, yet short of our 20,000 new names for 10 weeks each. We would like to have enough to make up the full 20,000 new names by January 1. If two out of every five old subscribers would send one name we would get the 20,000 before the close of the old year. Besides, there is time enough even now for anyone to start in and win the first prize by New Year's. We are ready to send samples, blanks, etc., to anyone who will send us a postal card for them.

THE RURAL NEW-YORKER,
New York.

MARKET NOTES

THE NORTH WOODS are sending down their usual delegation of Christmas trees, which are piled up high along the docks on West Street. The trees are mostly of the spruce and hemlock family, and are put up with great care, the smaller in bunches, and the larger ones with limbs tied together. The packing is done so nicely that when loosened the limbs spread out and look nearly as well as wher in the woods. Retail prices run from 50 cents to $5 according to size. This year there was a large pile of ordinary hemlock twigs two or three feet long, for use in trimming the interiors of houses and churches. Of course, there are large quantities of holly and various mossy running evergreens, both loose and made up in ropes, wreaths and other forms. Much of the mistletoe comes from England, and at this writing has not arrived. Last year the bulk of it heated and spoiled on shipboard. What was fit for sale brought enormous prices, a little spray selling for 75 cents.

PUMPKINS AND SQUASHES of the better sorts are scarce, and sell at prices double last year's figures. There is no doubt that the use of corn-cutting machinery has lessened the growing of pumpkins, which are in the way of the harvester; and ordinarily pumpkins do not bring enough to pay a farmer for hauling them to market. Squashes sold so low last year that many growers were disgusted and reduced their acreage. It is reported that Minnesota has a fair crop of squashes, which have been bought by Boston parties. The size of the pieces of pumpkin pie in New York eating houses has not visibly diminished, but then there are schemes for adding other stuff to the filling. I have found apple sauce adulterated with mashed potato. The lack of flavor was a mystery until the cause was discovered. The potato appeared to mix very well and would hardly be noticed except by looking closely.

GROWER AND CONSUMER.—The following letter is from a New Jersey fruit man:

"This is a fruit-growing section, mostly small fruits. Our local market here is very small. Consequently we have to ship our fruit and produce mostly to the large cities by rail, to be disposed of through commission houses, which as a rule is very unsatisfactory to the growers. We are aware that the prices the consumers pay for our fruit and the prices returned to the growers are altogether too far apart. Is there any way to come closer in contact with the consumer? We can get along very well with insects, scales, fungus diseases, blights, etc., but the greatest trouble is in the market end. Often it makes but little difference in price whether we put our fruit upon the market in first-class or inferior condition. Can you suggest a plan to remedy this great difficulty in marketing?"

This question has been often discussed, but it is one in which interest is constantly growing. When a fruit grower compares the retail price at which his goods sell with the net that he gets, he feels, and often justly, that the difference is too great, and that somebody is getting more profit than his share. Of course, a man who lives at some distance from the city must have an agent here to handle his goods. There is no one better qualified for this than the commission man who has had years of experience in distributing produce throughout the city. The trouble is that in this commission business there is so much opportunity for dishonesty in various ways that can hardly be detected that rogues find it an easy field to work in. These people and the dead beats who receive goods without making any returns whatever, have brought the business into disrepute. There are enough honest commission men in New York to handle all the goods shipped here. Of course, they do not promise extravagant and unwarranted prices, and they sometimes make mistakes in selling too quickly or holding goods too long. It is for their own interest to get as high prices as they can, and make quick and fair returns, for upon these principles their business has been built up, and they know that there is no other way in which it can be continued. The difference between the wholesale and retail prices is not all profit to the handler, for waste, cartage and store rent must be considered. The complaint that it makes but little difference in price received whether fruit is first-class or only ordinary, shows that the receiver is dishonest or does not know his business. Of course, owing to the freakish state of the market during the fruit season, it may happen that, owing to a temporary scarcity, inferior lots on one day sell for more than better grades the next, but this is exceptional, and the rule is that quality and appearance count largely in the price obtained. We do not know how one farmer at quite a distance from the city can get any closer to the consumer to advantage than by having a reliable commission man act as his agent. It looks like a feasible plan, however, for associations of farmers to open depots for distributing their own goods at retail in cities. It is doubtful whether much more money would be made for a time than by selling through the better class of commission dealers, but features could be made of small packages for family use, and a trade mark standing for real merit, which would be a constant advertisement to increase the demand for the goods of the association. W. W. H.

NEW YORK STATE DAIRYMEN MEET.

A Good Meeting at Olean.

The meeting of New York dairymen at Olean on December 11-12 will pass into history as one of the most helpful of the long series. Olean lies in the heart of a great dairy section—a section in fact where cows are the chief farm machines and milk is a staple product. The interest in the oleo discussion and the fact that some of the most noted dairy authorities in the country were to be present served to attract a large audience. There was probably a larger proportion of actual cow men present than is usual at the New York meeting. By cow men we mean those who actually milk the cows, as distinct from creamerymen and manufacturers. This goes to silence one argument of the oleo men, who have claimed that the common farmers take no interest in the passage of the Grout bill, but that only a small class of creamerymen demand it. The way these same "common farmers" pour out and express themselves whenever they have an opportunity ends that argument. It was thought best not to have a display of of dairy machinery and fixtures at this meeting, and it was doubtless a wise move, for the speakers thus secured larger and more attentive audiences.

Mayor J. H. Waring, of Olean, welcomed the dairymen. He said that Allegany and Cattaraugus counties can supply as good dairy products as can be found anywhere. Yet bogus butter and filled cheese have come into the market as a menace to the dairy industry. It is legitimate for dairymen to get together and learn how to make better products, or how to cheapen and improve methods of manufacture. It is equally important for them to learn how to prevent fraud and unfair competition for, unless this can be done, their labor and skill will be largely wasted, and the incentive to study and develop new methods will be destroyed. The Mayor's address served to show how all who come in touch with dairymen quickly recognize the strong demand for legal protection from fraud. Jared Van Wagenen, Jr., responded, and referred to the business-like methods of organized farmers. Dairying is the greatest industry of the greatest State of the Union, and no excuses are needed when dairymen seek to combine, and thus pick up the successful methods of other lines of business. President Geo. E. Smith said that the Association in 25 years of work had met with varying fortunes, but on the whole had done its share in uplifting the dairy interests of New York. He spoke of the exhibits of cheese at Buffalo. New York had a total of 409 exhibits and scored 97.39. Canada with 200 exhibits scored 96.79, while Wisconsin with 219 exhibits scored 96.04. This shows how close the competition was, and while New York led it must be remembered that the exhibition was at her home, and that only the hardest work can win abroad. New York won a gold medal on butter and cheese, thus showing that it is possible to make the finest of dairy products in the State when the conditions are right.

Prof. H. H. Wing, of Cornell, gave an excellent talk on "Some Results from Feeding a Herd of Poor Cows." He said that for the past 10 years they had been trying at Cornell to feed fat into milk—that is, increase the per cent of fat by special feeding. They conclude that it is not possible to make any permanent increase of fat per cent by changing the feed. It was argued that the Cornell cows were not fair specimens for such a test, so a herd of 20 cows was selected that seemed to be better suited. The owner was in debt and could not buy the required grain feed. The cows were mostly young—giving from 10 to 20 pounds of milk per day. This milk was tested before the feeding began, and from March to November weekly records were made. Then 10 of the cows were bought for $25 each—best and poorest included. They were fed silage and hay and from four to six pounds of bran, corn and oats and cotton seed mixed. After calving they had all the grain they could eat—from eight to 14 pounds per day. This grain was fed while the cows were at pasture, the plan being to see if they would give richer milk than before, and how much. As a result of all this one cow made an average gain in butter fat of one-half of one per cent. Three others gained .44, .41 and .41 respectively—others less. One cow actually gave a poorer milk under the heavy grain feeding. One cow gained heavily in milk, giving 2,476 pounds in 1900 and 5,049 pounds for the period in 1901 while under test. This cow ate 14 pounds of grain per day. This does not show any great increase in butter fat as the result of heavy feeding. Prof. Wing drew the conclusion that all such tests show that each cow has a certain individuality of her own. What one will do is no rule for another. It pays to know what each cow is doing, and then vary the feed and care if results show it to be desirable.

Prof. I. P. Roberts read a thoughtful paper on "How May the Profits from Our Dairies Be Increased?" The profits of dairy husbandry are not what they should be. Suppose the eight-hour system were established in the dairy. Other lines of business have prospered on an eight or 10-hour day, but dairying has always required long and arduous hours of toil. It would be impossible to meet the shorter day unless the economics of milk production can be simplified and improved. The cows in the Pan-American test showed a profit, excluding the calf, of $41.56 per cow for six months. That is, the selling price of the butter was that much greater than the actual cost of the food—not counting labor. The butter in this case brought 25 per cent more than the average price received by dairymen in the State. Many practical dairymen work from early morning until after sundown at night, and at the end of the year have but a few hundred dollars surplus. Prof. Roberts believes that much of this lack of success is due to bad management or carelessness. At least one-half of the cows in the State do not pay. At Cornell some years ago the herd averaged scarcely 3,000 pounds of milk per year. In 1898 the descendants of these cows averaged 7,575 pounds. These cows are largely grades, but good bulls have been kept at the head, the cows have been well fed and selected by the scales and Babcock test. The Binghamton beet sugar factory sold its old machinery for scrap iron and put in a new plant at a cost of $200,000. The result is that the company will be able to pay dividends while the old machinery meant sure failure. Dairymen may learn a lesson from this. If half a million cows could be sent to the fertilizer heap the situation would be relieved and prosperity given to a struggling industry. Prof. Roberts says that our stations, institutes and conventions do not reach and convince the man with the unprofitable cow. We make laws to exclude cheap labor, but forget the cheaper labor on the farms of New York State who work 12 hours per day at five cents an hour, and whose products compete in every market with those of better paid labor. Teachers must be sent to the homes of those men, and even then the work of education will be painfully slow. Prof. Roberts did not attempt to tell how this work is to be done. He painted the picture in dark colors, and called for volunteers to show how it may be remedied.

The following officers were elected for the ensuing year: President, D. P. Witter; vice-president, H. E. Cook; secretary, W. W. Hall; treasurer, F. E. Dawley; directors, Jared Van Wagenen, W. H. Jordan, R. P. Grant, M. T. Morgan, Geo. W. Sisson and J. C. Sibley. The honorary vice-presidents are: B. B. Odell, of Albany; T. L. Woodruff, of Brooklyn; C. A. Wieting, of Sehoharie; E. J. Burrell, of Herkimer; C. H. Royce, of Dutchess; F. H. Merry, of Oneida; W. E. Daud, of Livingston; J. P. Clark, of Chautauqua; R. H. Bent, of Jefferson; E. J. Preston, of Dutchess; F. A. Converse, of Jefferson; A. D. Harrington, of Chenango; F. W. Borden, of Montgomery; V. C. Beeby, of Wyoming; F. N. Godfrey and F. W. Higgins, of Cattaraugus. Resolutions were adopted stating the justice of the Sherman cheese bill and the Grout oleo bill, and urging all New York State Congressmen to vote for these measures. Secretary Wieting's administration of the State Agricultural Department was commended, and the thanks of the Society to the citizens of Olean, and particularly to F. N. Godfrey, who worked hard to make the convention a success, were given with a rising vote. The convention also denounced the scheme of Government irrigation for the arid lands.

In The Summer

Of life a woman may find herself fading and failing. She doesn't understand it. She goes to doctors, who treat her for this or for that, but she gets no better. She grows frail and pale. She can just "drag about the house," but has no pleasure in life.

Many such women have taken advantage of Dr. Pierce's offer of *free consultation by letter*, and have been restored by Dr. Pierce's treatment to perfect health. There is no more wonderful medicine for women than Dr. Pierce's Favorite Prescription. Its action upon the womanly organs is at once apparent in the decrease of pain and the increase of strength. It cures female weakness and such diseases as take away the strength and beauty of women.

Sick women are invited to consult Dr. Pierce by letter *free*. All correspondence private. Address Dr. R. V. Pierce, Buffalo, N. Y.

"Before I commenced to use your medicine I was in a bad condition (for eight years) and four doctors treated me," writes Mrs. Bettie Askew, of Garysburg, Northampton Co., N. C. "They, of course, gave me at the time some relief, but it did not last long. I was some days in my bed and some days I dragged about the house. I have used five bottles of Dr. Pierce's Favorite Prescription and five of the 'Golden Medical Discovery,' and four vials of the 'Pellets.' Now I feel like a new woman, and I want the world to know it."

The action of the "Favorite Prescription" is assisted by the use of "Pleasant Pellets" when the bowels are irregular.

RHEUMATISM

The Dr. Von Post great Holland Remedy, "QUICKRELIEF," in capsule form, QUICKLY CURES RHEUMATISM IN ITS WORST FORMS. No free doctors. No free samples. No free humbug, but an HONEST and special QUICK RELIEVING remedy. Don't wait and suffer. Price, by mail, $1 per hundred, or send 25 cents in silver and get 25 capsules for trial. Your "quarter" back if not satisfactory. JOHN H. POST, Deep River, Conn.

Trade Mark.

LUMP JAW

Easily and thoroughly cured. New, common-sense method, not expensive. No cure, no pay. FREE. A practical, illustrated treatise on the absolute cure of Lump Jaw, free if you ask for Pamphlet No. 241.
Fleming Bros., chemists, Union Stock Yards, Chicago, Ill.

BRAND NEW STEEL ROOFING

Bought at Receivers' Sale. Sheets either flat, corrugated or "V" crimped. No tools except a hatchet or hammer is needed to lay the roofing. We furnish free with each order enough paint to cover and nails to lay. Price per square, $1.75
A square means 100 square ft. Write for Free Catalogue No. 67 on General Merchandise. Chicago House Wrecking Co., West 35th and Iron Sts., Chicago, Ill.

All Hands Need It

when all known resources fail, no matter how deep-seated, complex, chronic or acute the case, its penetrating, absorptive, antiseptic power is unfailing.

Veterinary Pixine

brings quick relief. Scratches, Grease Heel, Mud Fever (that defied treatment for years); Abscesses, Stinging Sores, Hoof Rot, Cow Pox, Mange, all Inflammatory Swellings, Old Sores and Skin Disease

Absolutely Cured.

Heals without Scab. Stimulates New Growth of Hair—natural color. It penetrates, soothes and heals. Money back if it fails.

2 oz., 25c.; 8 oz., 50c.; 5-lb. pkge., $4.

At all druggists and dealers or sent prepaid.

DAIRY AND FARM NOTES.

Building a Dairy Barn.

PART IV.

WARMTH AND THE COW.—While we are speaking of warmth, it may not be out of place to ask what is the correct temperature for a milch cow. I am willing to confess ignorance, and as willing to say that in my judgment formerly-accepted Winter temperatures have been too low. Probably 40 to 50 degrees would represent a range as usually given by practical men when discussing the subject in institute work. No doubt the temperature in these same cases would be found lower by actual test. It is easy to guess, and just as easy to be wrong, and easier. My judgment had until recently been in accord with the general view, but since having a chance to give nearly perfect ventilation, the whole question has changed, and now I easily see why I did not care for a higher degree, and I believe the same reason will stand true generally. We could not maintain a pure atmosphere and make the doors, windows and walls tight enough to maintain this high degree. To tell it all, we could not carry even a 40 to 50-degree average and have anything like pure air. Pure air in stables has been in the past only a relative term. We say, yes, the air seems very pure and free from odors not because we compare it to the well ventilated rooms we live in, but we compare to some other stable much worse, and from that

PLATFORM IN COW STABLE. FIG. 390.

position we may be right. The actual condition of things, however, must govern, and not comparative conception.

WARM AIR AND PURE AIR.—We have grown up to expect a stable odor in our clothing and think nothing of it. My conception now of a pure air is one in which a man may work without the objectionable stable odor; a pure stable air just like a pure house air. It appears to me that the limit of warmth has not been reached. We find a Summer temperature of 70 degrees usually the most satisfactory, all other things being equal, for milk flow. It is not the hot, sultry day that gives the big mess, nor is it the other extreme ranging in the forties or fifties, so the question comes to me, why a lower Winter temperature, provided the air is frequently changed? There is a limit, however, because only animal heat is at hand. We have been able to maintain a range from 54 to 60 degrees with the varying changes of a northern New York Winter.

A WELL-BUILT STABLE.—The stable is ceiled with matched lumber both inside and out, and on the southern and western sides, which are the sides exposed, as shown in Part III., an extra lining with building paper is put in between the inner and outer walls. This air chamber thus formed has two advantages, making a high temperature possible and also preventing quick condensation. A single wall, however perfect the ventilation, with its cold contact will condense vapor before a ventilating flue can get hold of it. We are using a single wall on another stable, and while we can keep up the temperature fairly well the stable does not seem so dry. The expense of side wall is not much greater than when double boards and paper are used. The actual cost of lumber for the side wall of this stable in Part III was 8,000 feet of inch lumber, planed and matched, worth $16 per 1,000, or $128, and the lumber used between the walls was worth $10, making a total cost of $138. Double boards and paper would have required 7,000 at $12 plus the surface planing, costing $1.50 per 1,000, making a total cost of $94.50. Cost of paper added would make $100, a saving of $38. I am not able to state the difference in cost of labor in putting on the surface planed, but I should say that it would be not more than $10 less, a total saving in this case of $50, very small indeed, and the subject is well worth careful attention. I would suggest and advise all who intend to adopt the King system of ventilation or any other system as good if anyone has succeeded in finding it, to build in the manner indicated.

STONE WALLS AND AIR SPACE.—I do not like stone side walls. It is very difficult indeed to get a full measure of sunlight through the windows, and unless an air space is left in the wall condensation will take place more readily than upon the board wall with air chamber. I have never been quite able to understand the general use of stone. Wood is cheaper. If the stone walls were not built higher than the base of the windows all would be well. Another saving was effected in the barn in Part III. over a two-story barn in size of timbers and thickness of wall. In a two-story barn great strain comes upon the wall and structural support, while in a ground plan the strain comes chiefly upon the ground. I am not in accord with the teaching that an animal needs one cubic foot of air space for each pound of live weight. If we were to build a box large enough to supply pure air without change the animal could not warm it. I find that we cannot reduce the space below one-half cubic foot per pound live weight without infringing upon the space necessary for handy and economical care of stock. If we take for granted that nine feet in the clear is correct we must have from 34 to 40 feet in width, depending upon whether the cows stand face or tails together. We are using both kinds, and each has its objections; quicker and easier feeding in case of heads together; with heads to the sides less width by six feet is required, from the fact that only one driveway is necessary to haul manure, one trip sufficing to clean both sides unless more than a load is made daily. Another item of saving is the cleaning of these drive platforms. In the double drive we are cleaning a space 16 feet wide, and in the single drive only nine feet. Where platforms are kept clean we find quite a saving of time. A six-foot manger is wide enough for a single row; a platform about five feet, and built like Fig. 390, A representing the stanchion or manger; back 18 to 20 inches to a point B the floor is level. Here a gentle rise takes place of 1⅛ inch in cement floors and 1½ inch in plank, ascending back to the point C. which is level with the floor line A, B. This does not disturb the animal by slipping as usually found on an incline from the manger to gutter. The same effect is given to the rear part of the platform, and the cows kept clean; a gutter eight inches from C to D 15 inches wide, and six inches from E to F, and a pitch of 1½ inch on the drive platform for each five feet.

H. E. COOK.

Jersey and Holstein Cross.

In your issue of November 30 the question of crossing the Jerseys and Holsteins successfully was discussed and decided in the negative. The decision was based chiefly on the premise that the two breeds were so unlike they possessed no common characteristics. While it is true that in form, color, size and milking qualities they are wholly different, it is also true that each is marked by positive qualities that assert themselves more conspicuously than do those of almost any other dairy breed. The most careless observer may detect the slightest mixture of Jersey blood in a herd of scrub cows, and it is this quality of persistence that underlies heredity. The same is equally true of the Holstein. The one excels as a producer of butter fat, but is somewhat deficient in capacity as a milk producer. The other is generally credited with the opposite qualities. Here then we have the ideal conditions of a successful combination, and the writer inclines strongly to the belief supported by observation, that with a Jersey bull of ordinary prepotency and a Holstein cow of large milk capacity, the progeny may be as safely counted on for good dairy animals as can those from any other cross. The utility of cross-breeding at all is still and fairly an open question.

Breeders' Directory

JERSEY BULL

Yearling—registered, from a great show cow; almost faultless, by a producing sire. Farmer's price. R. F. SHANNON, 907 Liberty St., Pittsburg, Pa.

"QUALITY"

For Sale—Two A. J. C. C Bull Calves, full brothers in blood. No. 1, dropped August 30, 1901; dam's test 17 pounds 5 ounces from 265 pounds milk. 8,619 pounds milk last year. No. 2, dropped September 23, 1901; dam's test 17 pounds 12 ounces from 280 pounds 12 ounces milk; 7,244 pounds milk last year with second calf. Granddams and great granddams tested cows. They have the "Quality," and are for sale at reasonable prices. For particulars write E. W. MOSHER, Aurora, N. Y.

123 HOLSTEINS all ages, for Sale DELLHURST FARMS, Mentor, Ohio.

For Sale—PUREBRED HOLSTEIN-FRIESIANS from best families. A registered bull ready for service and bull calves. Also have purebred BERKSHIRE SWINE and SCOTCH COLLIE PUPS at low figures. Write for breeding and prices. W. W. CHENEY, Manlius, N. Y.

FOR SALE—Registered Hereford Bull, 1,500 pounds, three years old, first-prize winner, well marked and gentle. For price address E. H. PALMER, Mgr. "Fernside," So. Lee, Mass.

JACKS FOR SALE

An extra fine lot of Jacks; all premium Jacks. All stock delivered free aboard cars at city of Indianapolis, Ind. Address Baker's Jack Farm, Lawrence, Ind

$23.75 for top Poland-China sow, bred for Spring. These are the mellow, easy keepers. $10 for Sept. pigs. K. HAWK, Mechanicsburg, Ohio

Reg. P. Chinas, Berkshires and C. Whites.

Choice Pigs, 8 weeks old, mated not akin. Bred Sows and Service Boars. POULTRY. Write for **hard times prices** and free circular. HAMILTON & CO., Rosenvick, Chester Co., Pa.

2000 FERRETS. First-class stock. Some Trained New Price-list free. N. A. KNAPP, Rochester, Lorain Co., O.

ANGORA GOATS are handsome, hardy and profitable. Prize stock. Low prices. Large cir. E. W. Cole & Co., Kenton, O

ANGORA GOATS

We are offering the following for sale, all of the Bailey Strain:

100 Angora Does
40 Yearling Wethers

Lot of Fine Bucks. Photographs and prices on application. Correspondence solicited. Address W. P. BROWNING, Westerly, R. I.

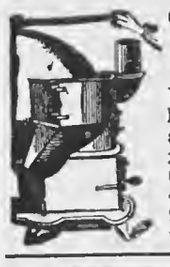
HOMING PIGEONS—Twenty-five pair, guaranteed Stock at $1 per pair. S. B. ARTHURS, Brookville, Pa.

Light Brahmas and White Plymouth Rocks. Fine birds of each, fit to show. Thirty years a shipper of Fine Poultry. J. A. Roberts, Malvern, Pa

For Sale—300 Choice Barred and Buff P. Rocks; also White and Silver Wyandottes. Price reasonable. DR. S. C. MOYER, Lansdale, Pa.

BARGAINS—200 cockerels at $1 each. Buff Wyan.; Buff Rocks; S. C White Leghorns; R. C. Brown Leghorns. Everyone a thoroughbred. A. B. KATKAMIER, Macedon, N. Y.

Cockerels—Choice W. Wyan., P. Rocks, Brahmas, Cochins, Leghorns, from prize-winning stock. 23 varieties of land and water fowls. Satisfaction guaranteed. Big catalogue free. Pine Tree Farm, Box T, Jamesburg, N. J.



COOK YOUR FEED and SAVE Half the Cost—with the **PROFIT FARM BOILER**

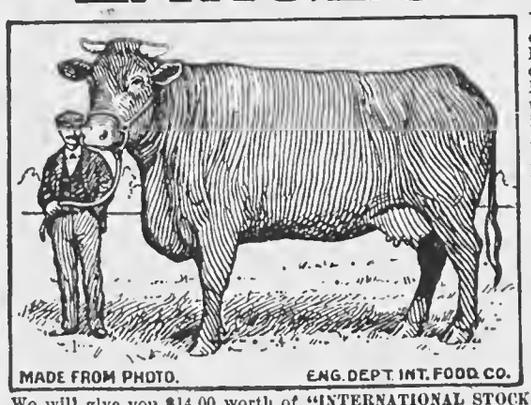
With **Dumping Caldron.** Empties its kettle in one minute. The simplest and best arrangement for cooking food for stock. Also make **Dairy and Laundry Stoves, Water and Steam Jacket Kettles, Hog Scalders, Caldrons, etc.** Send for circulars. D. R. SPERRY & CO., Batavia, Ill.

RIPPLEY'S COOKERS.

Sell from $5.00 to $45.00. Made of boiler steel. No flues to rust or leak. Can't blow up. Guaranteed to cook 25 bu. feed in 2 hours, and to heat water in stock tanks 200 feet away. Will heat dairy rooms. Catalogue and prices mailed free.

Rippley Hardware Co. Box 228 Grafton, Ills.

LARGEST COW IN THE WORLD



WEIGHT 2970 LBS., AGE 8 YEARS, SHORTHORN. She eats "INTERNATIONAL STOCK FOOD" every day and is owned by International Food Co., Minneapolis, Minn. "INTERNATIONAL STOCK FOOD" causes Cattle, Horses, Hogs and Sheep to grow very rapidly and makes them Big, Fat and Healthy. Is used and strongly endorsed by over 500,000 Farmers. **It is sold on a Spot Cash Guarantee to Refund Your Money in any case of failure** by over 30,000 Dealers. It will make you extra money in Growing, Fattening or Milking. Owing to its blood purifying and stimulating tonic effects it Cures or Prevents Disease. It is a safe vegetable medicinal preparation to be fed in small sized feeds in connection with the regular grain. **It Fattens Stock in 30 to 60 Days less time,** because it aids Digestion and Assimilation. In this way it saves a large amount of Grain. The use of "INTERNATIONAL STOCK FOOD" only costs **3 FEEDS for ONE CENT.** Ask your dealer for it and refuse any of the many substitutes or imitations. It always pays to feed the best. "INTERNATIONAL STOCK FOOD" is endorsed by over 100 leading Farm Papers.

A $3000.00 STOCK BOOK FREE

MAILED TO EVERY READER OF THIS PAPER.

This Book Contains 183 Large Colored Engravings of Horses, Cattle, Sheep, Hogs, Poultry, etc., and of this Cow. It cost us $3000 to have our Artists and Engravers make them. It contains a finely illustrated Veterinary Department that will save you Hundreds of Dollars. Gives description and history of the Breeds of Horses, Cattle, Sheep, Hogs and Poultry.

THIS BOOK FREE, Postage Prepaid, If You Write Us a Postal Card and Answer 3 Questions:

1st—Name this Paper. 2nd—How much stock have you? 3rd—Did you ever use "INTERNATIONAL STOCK FOOD" for Horses, Cattle, Sheep, Hogs, Colts, Calves, Lambs or Pigs. The Editor of this Paper will tell you that you ought to have a copy of our finely illustrated Book for reference. The information is practical and the book is Absolutely Free.

We Won the Highest Medal at Paris in 1900.

We will give you $14.00 worth of "INTERNATIONAL STOCK FOOD" if Book is not exactly as represented.

3 FEEDS FOR ONE CENT

SHREDDED FODDER FOR SHEEP.

There seems to be some argument about the value of shredded corn fodder for feeding sheep. Some of our readers say that this fodder is better for feeding horses and eattle than for sheep. If you have fed it will you let us know what you think of it? Do you think it pays to shred the fodder? What grain is best fed with it?

Shredded corn is all right for horses and cattle; they clean it up pretty well. But the drawback is that so many people shred it too soon, before the pith is properly dry, and if not thoroughly dry it molds easily, and you do not get the full benefit. Our experience is that it is not first-class sheep feed.

Creston, Iowa. A. L. WILSON.

It pays to shred corn fodder to feed sheep, because you can then keep it in the dry and feed it to them fresh and bright. They will not eat much more of it shredded than whole, perhaps not as much, but if it gets wet and spoiled in the shock they will not eat it at all. Feed some grain with it that is rich in protein, or feed abundantly of wheat bran, and you will make a fine gain, but you cannot feed corn alone and shredded fodder and make it win, there is too little protein in the ration. W. O. WING.

Ohio.

We have not thought that it pays to shred the fodder. A great deal of it is being done among our neighbors, and they advise us that it is chiefly done to get the corn and fodder in while the weather is good. A great many recommend it for horses and cattle, not so much for its additional feeding value as for the soft, dry bedding that the refuse makes. In feeding fodder to breeding cows we prefer to run it through a cutting box, corn and all, cutting it into bits about an inch to two inches long. By this a feed of great bulk is made that is rich enough in grain food to form the main part of the Winter's feed, and still have the refuse left for bedding, without the expense of shredding. In addition to this ration we mix bran and a little oil meal for cows that have calves or are soon to calve.

Pendleton, Ind. C. E. SWAIN & SONS.

I have fed shredded corn stover to horses, cattle and sheep for a number of years, with good results. I have known of bad results where breeding ewes were fed corn fodder almost exclusively, getting too much of a carbonaceous ration, accompanied with too little exercise possibly. But I believe where they are properly managed corn stover can be made a very useful roughage. Bran and oats, equal parts by weight, make a desirable grain ration with corn stover, and if possible add some succulent food in form of roots. I think that this year especially it pays to shred, for all roughage must be saved and made to go as far as possible. Taking Timothy hay as a standard for roughage, and placing it at $12, corn stover is found to have a value of $8.25 per ton. When we consider the great losses occurring from having it whole, the disadvantage in handling, together with the greater amount of refuse, it would seem to be an advantage to shred and take care of it at above price. If, however, it were possible to secure the clover as hay at the market price I doubt very much whether it would pay to put any unnecessary expense to the fodder, as the actual feeding value of the clover is far greater relatively than the market price. For instance, one ton of Red clover hay contains 130 pounds of digestible protein, or blood and muscle-making properties, against 40 pounds in corn stover, and this is the chief element sought in our feed stuffs.

Pecatonica, Ill. JOHN HITCHCOCK.

10 Weeks for 10 Cents. You have several neighbors and friends who need THE R. N.-Y. We are going to help you to see that they get acquainted with it. For our part we will send the paper to them now 10 weeks for 10 cents—a cent a week. We ask you to call their attention to this offer. Perhaps you can get up a club. The 23 largest clubs will each get a cash premium January 1. Will you be one of them?

That Connecticut Milk Strike.

It is now past history, yet still another account of that milk war in Connecticut will be helpful. This is the way for farmers to "get together."

The situation has been bad for years. While other sections of New England milk trade have been more or less organized for the protection of the farmers, there was nothing of the kind on the Providence car running from Willimantic, Conn., to Providence, R. I., so of course the contractors "played horse" with the farmers just as they saw fit. The contractors offered 31 cents for a 10-quart can (this is delivered at depot). This is one cent per can higher than last Winter, but grain is so much higher that the farmers felt they could not afford to make milk at that price and demanded 36 cents per can, a raise of five cents. The farmers then proceeded to organize a milk producers' association at every depot on the line, and notified the contractors that they would stop November 16 if the price of 36 cents was not granted. The strike was quite general, and it is estimated that 600 cans were stopped out of the usual number of 800. The contractors got 100 cans from Boston for one day to help them out, but this left some peddlers entirely without any milk, and the contractors, after trying New York and Philadelphia in vain for extra supply, surrendered and granted the price asked. So much for coöperation among the farmers. The price asked is not unreasonable, and it is thought that the success this time may encourage the farmers to hold to their organization and induce others to join.

EVERETT E. BROWN.

Success With Broilers.

I notice in several of the papers statements that the broiler business is overdone, broilers a failure, they cannot be made to pay a profit, etc. I have a lot of broilers that were hatched in the Summer when eggs were very cheap, thus making the first cost less; the weather was very warm at times, thus using less oil to run the incubators, and as the warm weather also helped to keep the chicks warm there was less coal used than in colder weather to keep the brooder house warm enough for the little fellows. The pens in the brooding house are about 4x6 feet and the yards adjoining are but 16 feet long, and they have been kept in the house and yards right along, so we know always where they are and just where we have to go to feed them, and can easily see if they are properly attended to. Hatching them in the time that eggs were plentiful and cheap makes the first cost less, but we need to have that less, as we have to sell at the lowest price of the year, which is always in the late Fall. I am now getting 18 cents per pound for them dressed, which is simply killed and the feathers taken off, dry-picked. We pack in barrels and deliver to the station and the dealer pays us for them net without any freight or other expenses. The sizes that are wanted are one to two pounds each. We try to get them as near the two-pound weight as possible, as the last pound can be put on cheaper than the first. As to feed, they can be raised to the above size at an actual cost for feed even at the prevailing high prices from eight to 10 cents, and allowing five cents each for them when out of the incubator makes a cost of 15 cents each actual outlay. By careful selecting we kill so as to average lately 33 cents each or thereabout, and the expense in dressing is three cents each, so they net us 30 cents each. Less the actual cost of producing gives us 15 cents each for our work, which seems to pay as well as almost any other part of the business. We had at the middle of September nearly 4,000 chicks out, and now are marketing about 200 weekly, and have reduced the lot to about 1,300; most of these will be away before the first of the year.

New Jersey.

Live Stock Notes.

BONE MEAL FOR COWS.—I have fed ground bone to milch cows and have found in many respects it is helpful, especially to those that are kept for breeding purposes. On the other hand, during the past few years I have not been so particular about its use. In fact, we have not used it for some time, and we have had very good results with our herd I would sum up regarding its use something as follows: That in a herd of dairy cows kept for breeding purposes, if the cows are not in their best and most vigorous condition, and if there is trouble with weak calves, the use of bone meal will be found very beneficial, but with a herd where these troubles do not exist, I would feel that my own experience did not warrant me in saying that the feeding of bone meal was necessary. WM. H. CALDWELL.

HOLSTEINS AT PAN-AMERICAN.—As to dairy test at the Pan-American, we believe all fair-minded men will agree that the estimates of the value of skim-milk should have been given in all tables published by the managers of this test. Would a farmer taking a load of wheat to mill expect to leave the bran and other by-products without having credit for same? With these products credited the Holstein-Friesians show a profit of $262.64 on total solids, being $26.84 greater than their next nearest competitor, and for total solids and gain in weight they surpass all other breeds. We believe if the results of this test had been published giving tables complete, that there would have been no complaint from our people, but they have been very misleading. The western farmer and dairyman who is fully posted with the outcome, will be very well satisfied with the result so far as our breed is concerned.

Hampton, Iowa. W. B. BARNEY.

THE OLD RELIABLE REMEDY
For Spavins, Ringbones, Splints, Curbs, etc., and all forms of Lameness is

NEVER FAILED.
Brixton, Mont., Dec. 12th, 1899.
Gentlemen:—I will say that I have used Kendall's Spavin Cure for the last ten years as a liniment; I have cured three bone spavins, one curb and one ringbone. I have never failed to cure anything that I have tried. Please find enclosed stamp for your "Treatise on the Horse and his Diseases."
Very truly yours, CLIFFORD SHELBY.
Price $1; six for $5. As a liniment for family use it has no equal. Ask your druggist for Kendall's Spavin Cure, also "A Treatise on the Horse," the book free, or address

FEEDS AND FEEDING

NEXT WINTER it will be necessary for our farmers to study the question of stock foods. Corn, the great stock grain, will be high in price, and substitutes must be provided for it. How can these substitutes be found? Only by comparing other and cheaper foods with corn, and knowing beforehand how they will affect the animal. This comparison may be done by studying analyses, but a farmer cannot afford to spend the Winter in experimenting. He must know beforehand what others have found out. He can learn this by studying Prof. W. A. Henry's great book. Feeds and Feeding tells you just what you ought to know about foods and how to feed them. It is full and complete, and easy to read. Price, $2.
Sold by THE RURAL NEW-YORKER, NEW YORK.

CORN FODDER FOR FATTENING LAMBS.

WHAT TO FEED WITH IT.

Should It Be Cut or Shredded?

This is the fourth Winter that I have had lambs in my lots fattening for market, and as corn fodder is one of the largest products of the farm, I have endeavored to learn its value as a part ration for the lambs. Research shows but one careful experiment in this direction, made at one experiment station, that of Michigan, that showing that fodder was undoubtedly of great value for this purpose. The papers have been full of statements of the value of this product for feeding purposes, but these statements are not backed by facts derived from careful experiments, and are made mainly by manufacturers of machinery for handling this crop. Consequently the greatest proof the farmer has of its value for feeding purposes is the avidity that farm animals show in consuming it, i. e., the relish they have for it. If properly fed they seem never to tire of it, but the fact that plainly shows up is that it is not a complete feed; that young cattle or horses fed all Winter all they will eat of it come out in the Spring without gain of weight. The point that concerns me in feeding the lambs is, how much of this product I can safely use as a part ration for the lambs in connection with clover hay, corn, and this Winter, barley straw, wheat straw, and Finger or Crab-grass hay. In growing corn here, the aim is always to perfect the grain before the corn is cut, and if properly cared for, the fodder is of fine quality. We never care to sacrifice the grain to improve the quality of the fodder, nor do we think the value is seriously lessened by ripening the corn before cutting. I feel sure that if I fed ear corn as the grain ration, and only fodder for roughness, I should then, as the lambs began to fill up, have trouble with constipation in the flock. Last Winter for a time I fed fodder twice a day, and clover hay once, and came to the conclusion that for safety they should have more hay and less fodder.

I feed the fodder whole in racks, and lose but little besides the stalks. The racks are 12 feet long; the fodder is bundled. I carry a bundle to a rack, drop the top into the rack, allowing the butts to rest up on the end of the rack, cut the string, divide the bundle, and turn one-half of it towards the other end of the rack with butts resting upon the end of the rack. This prevents the packing of the fodder in the bottom of the rack. Lambs do not feed down through the roughness fed them for the finer parts, like horses and cattle, but on top, pressing the mass down tighter all the time. This tendency I find it necessary to work against. I feed the fodder out of doors in racks. Yesterday it was raining and disagreeable most of the day, and no fodder was fed, but hay in racks under roof. I am in doubt whether they would eat any more of the fodder shredded than whole, probably not as much. The shredding reduces to dust many of the finer blades, and the dried tassel parts the lambs most relish. In the fine dust form they will not eat them. I am supported in this belief by a friend who has had before his lambs both whole and shredded fodder; he says they do not like the latter. If it was necessary for me to feed fodder under cover in the barn and sheds I would think seriously of cutting it with cutting box, to make it more easily handled. As it is fed in racks in the lots, its coarseness does not annoy me.

When the lambs are fattened and out of the lots to market, I turn my brood sows or feeding hogs into the lots, and feed shelled or ear corn, over the cornstalks, and they soon reduce them so they quickly decay and can be easily handled when it comes time to remove the manure. I am sure that cut fodder would be more acceptable to lambs, or sheep, than the shredded. Close observation as to their manner and habits of feeding, leads me to this conclusion. I think it would be well for the experiment stations to take hold of the fodder question and give the farmers more light as to its actual value; fed alone and in combination with other foods for lamb and sheep feed, as well as other stock of the farm. Experiments may have been made that have escaped my notice. If such is the case, I shall be glad to know of them.

Ross Co., Ohio. JOHN M. JAMISON.

AN EXPERIENCE WITH BEET PULP.

The article, "Notes on Old and New Feeds," on page 819, strikes me just right, and I give a little experience we have had with this beet feed. This Fall we purchased two tons of this feed at $2.50 per ton. After feeding it we failed to see where we gained, either in milk or butter, and we now think we could have used the $5 to better advantage. We had never used any of this feed before, and therefore knew nothing of its value, but as it seemed very cheap as compared with other feeds we thought at first we were doing well. When I loaded the stuff into the wagon from the car I found it was mighty heavy and had on two tons before I knew it. When I reached home I got down from the wagon and found water dripping from every crack in the wagon box, and now we have made up our minds that if we want to feed our cows beets we will raise the beets, and let the cows drink what water they want from the brook, instead of buying it for them at $2.50 per ton and drawing it 4½ miles in the bargain. A short time ago I was talking with a well-to-do farmer. He said he had also been using beet pulp, and had been paying $4.50 per ton and told of a dealer who was asking $6 per ton. But what set me thinking was that this very man had this last year raised sugar beets and delivered them at the car for $5 per ton, and then later on bought part of them back again at $4.50 with the additional weight of water. T. E. R.

A PUMPKIN CROP TO BE PROUD OF. FIG. 391.

GOOD PUMPKINS IN A BAD SEASON.

THE RESULTS OF INTENSIVE CULTURE.

One Success Among Many Failures.

Fig. 391 shows a picture of Malcom Huntley and a corner of a field of pumpkins grown by him during the past season on his farm near the shores of Lake Ontario, about five miles north of Wolcott, Wayne Co., N. Y. This represents a yield of nearly 20 tons per acre, the large pumpkin in the foreground weighing 97 pounds, and the one on which Mr. Huntley is sitting 73 pounds. Ordinarily, a field like this would be of little interest, but this year, when there has been almost a pumpkin famine, it has been an object lesson in intensive agriculture that people have gone miles to see. Last Spring the writer, employed by a Syracuse firm, made contracts with 43 farmers in the vicinity of Wolcott to grow and evaporate pumpkins, 100 acres being contracted for, which ought to have produced 50 tons of the evaporated product. Thirty-one of the contractors failed entirely to produce a crop, or produced so small a crop that it was sold to some of the 12 more successful contractors. Of the 43 contractors Mr. Huntley was the only one who was able to produce the expected amount from the acre contracted, and the amount produced by him, 1,150 pounds, practically was the product of three-fourths of an acre. If the whole acre had yielded as heavily as a part of it did Mr. Huntley believes he could have produced 2,000 pounds.

The almost complete failure of the pumpkin crop which was general throughout New York, Michigan, northern Illinois, northern Indiana, northern Ohio and northern Pennsylvania, was mostly due to unfavorable weather conditions, and to the ravages of the Black squash-bug. Mr. Huntley's success was due to two incentives that spurred him to action. First was the desire to secure as many dollars as possible from the crop, but most of all, Mr. Huntley says, was the fact that it is always humiliating to him to undertake a new thing and fail, so he selected a fertile piece of soil, gave the crop first-class tillage, hardly allowing a single weed to show its head, and when the bugs came he met them more than half way, well armed for the defense, and although it cannot be said that he won in the first round, he so crippled the enemy that they could not eat as fast as the vines grew; hence his success, which speaks volumes for thorough tillage and a grim determination to win in spite of adverse circumstances. J. O. WADSWORTH.

SHREDDED FODDER FOR STOCK.

On page 815 a writer tells of cutting corn fodder for hens. I have used a feed cutter not only in the manner mentioned, but to cut straw for the hens to scratch their grain from. My cutter can be adjusted to cut in five-eighths inch lengths. In this size clover can be used to good advantage steeped with bran to feed laying hens, or hens that one desires to have lay. You would be surprised to see how hogs will eat the same feed. Of course fattening hogs could not eat much of it to advantage, but for growing hogs it is undoubtedly a very cheap source of protein. Unless I am fattening sheep with poor teeth or finishing the fattening of fowls I simply put the ear corn through the cutter, cutting it to two-inch lengths by removing one-half the knives. Sheep, cattle and all kinds of fowls can readily remove the corn from the cob when

thus cut, and for hens it furnishes exercise. I prefer corn stover cut with this cutter into two-inch lengths to that run through a shredder. I have never tested the two side by side with my own stock, but I am certain I can feed the cut feed to my own stock with less waste than any of my neighbors do with shredded fodder (or stover). This may be the fault of the feeder. Many writers say that the refuse from shredded stover makes excellent bedding. I have nothing to say against the quality, but certainly if the quantity left by a horse or cow is sufficient to bed it properly the practice of feeding shredded stover is not an economical one. The tendency of the shredder is to make the whole mass more palatable. This makes it difficult for stock to separate the really undesirable portions from the rest, and the result is that more or less of the best of it is "nosed" over and is rejected. If cut the eatable portion is not so great, but the parts not eaten are easily sorted from the rest with no waste from being "nosed" about. Then if fodder (stover) is shredded when dry, as it often is, the leaves are pulverized and quite a large quantity lost. But neither method of preparing the stalks pays for feeding sheep. Careful experiments in feeding cut stalks to my own flock and observation of the feeding of others who used shredded stalks convinces me that sheep will leave a greater per cent prepared either way than when fed whole. J. D. P.

Archbold, Ohio.

R. N.-Y.—There seems to be a misunderstanding about this discussion of shredded fodder. Some of our readers refer to the work of the large machines which husk the ears and tear the stalk in pieces. On our own farm we use a machine which has an adjustible cutting cylinder, the "shredder" consisting of 24 sharp narrow claws or knives which split and tear the stalks. With us fodder torn in this way suits the stock better than that sliced off with a clean cut. In our experience they eat more of it. Where the fodder is simply chopped in pieces we have found that stock are likely to cut or bruise their gums in chewing it.

HENS THAT BALANCE THEIR RATION

And Save the Hen Man's Steps.

PART I.

The picture shown at Fig. 392 was taken in front of the barn of O. W. Mapes, the hen man. This barn is close to the road, and Mr. Mapes, who stands holding the bucket, believes in airing facts about agriculture. So he has written the announcement which appears on the little blackboard.

THE R. N.-Y. is somewhat responsible for this "balanced ration." Seven years ago we had a series of articles in which the various food elements were described and the importance of having a fair proportion of each brought out. At that time Mr. Mapes, though feeding over 1,000 hens, had not paid much attention to this side of the matter. Like many others, he fed grain and other foods, not knowing whether there was a surplus or a deficiency of the expensive muscle makers or protein. These articles led him to feed his hens with a lead pencil—that is, he took the analyses of the different foods and figured out his ration to see whether he could make it balance, and also to see whether he could feed his hens for less money. At that time his ration was about as follows:

Morning: A mash consisting of four pounds wheat bran, one pound cornmeal, one pound ground oats, one pound malt sprouts, one pound animal meal, 2¼ pounds pot cheese.

Noon: Four pounds of oats.

Night: Ten pounds whole corn.

This was the feed for 120 hens, and it gave fair results, but two of our Massachusetts readers gave Mr. Mapes new ideas. One of them told of keeping 29 hens in a little house 5x20, which cost only $7. These hens were laying 20 eggs per day in zero weather. They were fed each day three quarts of wheat feed and one-half pint of beef scrap and bone for breakfast, and three quarts of whole corn for supper, with plenty of cabbage and boiled potatoes now and then. Then came a man who made an average of $1.74 per year each from a flock of 250 hens. He let them take care of themselves, feeding wheat chiefly, and giving them a run on grass. This man said it did not pay to fuss with mashes, and that if grain and grass provided a balanced ration for cows, so it would for hens. Mr. Mapes spent some months in figuring and experimenting and finally hit upon a mixture of dried meat and various ground grains which he called the "balanced ration." This he fed with great success several years, but all the time the thought of the man who let his hens take care of themselves kept bobbing up. Has a hen sense enough to pick out her own food? In Summer, when she has free access to all sorts of food, she seems to balance her ration without the aid of the scientist or the fussy hen man. Mr. Mapes observed this, and so he began to feel his way along in a new direction. The result was that when I visited the farm in November the hens were actually feeding themselves! In former years the morning mash was mixed at the barn and carried in a wagon from house to house. This was no small job, as there are 40 houses well scattered. Thus far this Winter the hens have had no mash at all. In each house is a box of wheat and a box of corn, and a pan of skim-milk. The hens help themselves at will, and eat just what they want. Mr. Mapes has weighed the corn, the wheat and the milk repeatedly, and he says that the hens feed themselves just the proportions of protein, carbohydrates and fat that he gave them in his mixed balanced ration. The hens are kept constantly housed, and the warming device described two weeks ago keeps them comfortable. They are never hungry, but take small quantities of food at a time. They are laying as well as in former years, and are as happy and prosperous-looking as hens need ever be.

But do not hens need a mash or soft feed of some sort?

"Why?" answered Mr. Mapes. "If they are kept as warm as mine are they surely do not need it to heat them up. I do not know of any reason why a mash should be given except that it is the best ordinary form for feeding the strong protein portions of the food, such as meat or blood. As I am able to supply plenty of skim-milk I do not need to feed meat, and therefore the mash is not necessary. I do not expect to feed any this Winter, though the coldest weather may change my opinion about this."

Do you consider it really safe to leave a hen alone with unlimited food?

"Certainly—provided you give plenty of protein or muscle-making food so that she can easily digest it. It would not be safe to let a hen have nothing but corn before her, but with wheat added and some substance like milk she will surely do her own mixing.

THE SIGN OF THE HEN MAN. FIG. 392.

I have kept a hen in a berry crate for months with different foods within reach and she laid day after day and kept in perfect health."

Is there any substitute for the skim-milk?

"I think cut bone would answer and perhaps a cake made of bran, ground oats and animal meal dried and crumbled."

It would make this article too long to discuss in full Mr. Mapes's remarkable plan of feeding. He feeds the mixed ration to pigs. Why not let them balance their own rations? Is a pig more of a "hog" than a hen is? These and other points must be left until next week. H. W. C.

SEED SELLING; OLD AND NEW METHOD.

Seed selling through agents is a very old plan, the agent originally being the local storekeeper; this plan is still followed in some sections of the country, with the modification that flower seeds are now sent to the storekeeper in many instances through the mail instead of being delivered by team. In the early days firms like the Landreths, of Philadelphia, and the Shakers, of New Hampshire and New York, put their reputation into their seeds, and gave them a character for reliability, but other firms who entered the market with their box seed, mere money-makers, without a conscience, greatly injured the business through the districts where they marketed, making such seed a by-word for unreliability. This and the defect more general among the box trade of not supplying the newer improved varieties gave birth to the mail business, which was an effort to supply the public not only with good seed but with seed of improved varieties of flowers and vegetables. B. K. Bliss, I think, was the first to start the mail trade in an extensive way, and the late James Vick and Peter Henderson and myself followed closely after. In the early days of over 40 years ago, we had to pay letter postage on all seed, and it was not until special and cheaper rates were made by the Government that the mail seed business grew into its immensity. In the early days the great West was the especial market of the mail seedsmen, but as towns increased in size the seed trade would become localized in their midst, and our market would move on to fields and pastures new. In those times we nurtured through their infancy, by giving control of local territory, provided they would agree to sell our seed only, men who have since taken rank among the leading seedsmen of the country. J. C. Vaughan, the great seedsman of Chicago, was, in his early days, one of my proteges for two or three years, under this arrangement, and the thorough honesty he displayed in carrying out his part of the agreement, was but a manifestation of that reliability which has justly won for him the large patronage he now enjoys. The mail trade is still a large and live business, bringing to tens of thousands of isolated homes blessings in vegetables and flowers that were formerly the monopoly of the more densely settled sections. Besides selling seed directly to the farmer the mail business invited its customers to act as agents at a per cent of profit, and it also sought to graft its business on other trades by traveling agents for such taking this as an additional source of income. Within a few years the seed business has developed along lines now followed by so many trades, that of having traveling agents of its own to whom are allotted certain sections of country to be canvassed between harvest gathering and seed planting. This is a costly way of doing such a business, and one that will not pay outside of the region devoted to intense farming where the demand is for large quantities of the higher priced seed. In addition to the outlay for salary and traveling expenses, which in scattered communities are large, the sales are rarely for cash; this necessitates extra labor and delay in collecting, with the risks that are always incidental to a credit business.

Marblehead, Mass. J. J. H. GREGORY.

LEGAL REMEDIES FOR FOUL SEEDS.

I was greatly interested in the article on "A Seedsman's Guarantee" in your issue of December 7. The decision in that case is right on principle, and will not be reversed upon appeal, unless some merely technical error has crept in at the trial. That question was tried out in the courts here several years ago, and decided in favor of the farmer, who bought Alfalfa seed and got foul seed along with it. The jury awarded him the damages which he proved, and the court sustained the verdict of the jury. There is a general legal principle and implied warranty that anything is suitable for the purpose for which it is sold, and that a fair price warrants a good article. "Seed oats" means oats that are suitable for seeding, and not oats mixed with foul seed. Seed grain generally brings a higher price than grain for feeding, and a good price implies a good article suitable for the purpose for which it is sold. The farmer depends and has a legal right to depend upon the judgment of the seedsman, and it is the business of the seedsman to know what he is selling. The same is true of fruit trees. If a nurseryman sells infected stock and the farmer is injured thereby the nurseryman can be held to respond in damages. The same is also true as to animals. If a farmer buys an animal for breeding purposes and he proves to be diseased or worthless the seller can be required to make good the loss. It is a general rule that where an article is sold for a special or particular purpose, along with the article goes an implied warranty that it is suitable for that purpose. Farmers are not supposed to be experts, and are only required to use ordinary care in order to protect themselves. The seedsmen and nurserymen are presumed to be skilled in their special business, and are required to exercise a greater degree of care than the farmers who purchase from them. If the farmer knew that the grain was mixed with foul seed, or that the nursery stock was infected, and still used it, he would be guilty of such contributory negligence as would bar his recovery. If after receiving the seed or stock he should discover that it was unfit to use it would be his duty to return it to the seller at once or notify him that it was held subject to his order. T. W. H.

Topeka, Kan.

AMERICAN HAY IN FRANCE.—When investigating the stories about "adulterated hay," or rocks and sticks in the bales, we wrote to a number of foreign hay dealers. The following note is from M. Cottard, Havre, France:

"I am sorry to say rocks, sticks and similar things that we found in baled hay in 1893-1894 were not jokes, nor was buying baled hay a gamble then. France bought from North America's dealers in 1893-1894 thousands of tons of baled hay, and if we received many lots of Timothy and clover hay that were of prime quality and in good condition, I am sorry many of them, especially later in the season, gave us a big loss through bad condition. Then we found rocks, sticks and old damaged hay inside the bales, musty, etc. Many claims took place then, and finally American hay was discredited on our markets. We might have imported hay from your side in August and September last, your quotations being then lower than ours, but French buyers preferred to buy home hay dearer rather than buy American hay. I wish you might induce your friends to ship their best hay to France whenever we can do business with your country."

NATURAL GAS ON THE FARM.

How a Kansas Farmer Uses It.

PART II.

My house is L-shaped, has 10 rooms, 19 incandescent lights and five stoves. The gas leaves the main in a 1¼-inch pipe at a pressure of 290 pounds. There is a cut-off at the main, also in the main to guard against accidents. The gas passes through a large regulator that cost $7.50, and always gives just four pounds pressure. This pressure can be increased or decreased by setting the set screw. The turning on or off of all five stoves never affects the 19 lights in the least, so well does the regulator do its work assisted by the large volume of gas held in the pipes in the house. The plumbing of the house cost $106, and of the yard as much more. The incubator is in the cellar under the house, and is run by one gas lamp, and it never changes at all. The brooders are back of the house, and are warmed by gas taken from the pipe outside of the regulator. They can be kept at the same temperature all the time with scarcely any trouble. There is no blowing out of the lights and filling and trimming them; it is the same hot dry heat all the time. The big torch in the dooryard draws gas from outside the regulator, and any amount of light can be had without affecting the gas in the house.

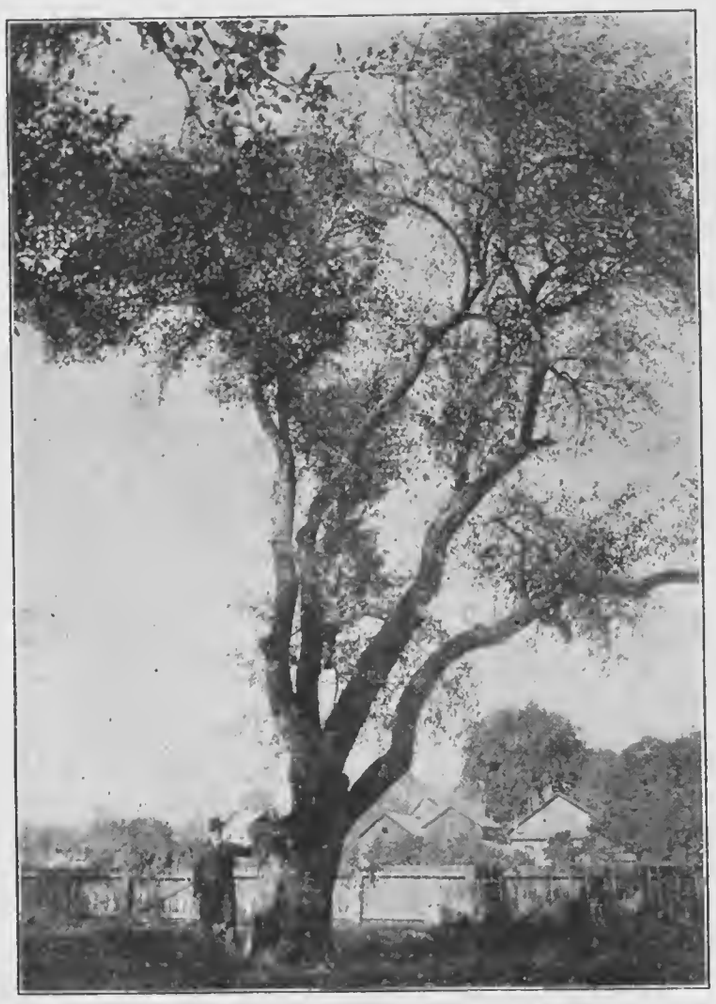
My blacksmith and woodwork shop is lighted up and heated by gas, also my feed or cook room, which is built on to the end of the shop. This room contains all the varieties of feed necessary to feed the hogs two months or more, and they are fed from the inside of this room without my having to go out. I have a heater or cooker 3x6 feet with inch iron straps across the bottom inside of it, and inside of this pan is another one with a sieve bottom that rests on the iron cross straps. I do not cook any feed but corn, and feed it three times a day. One-half bushel of corn makes 1½ bushel boiled feed, and with each half bushel shelled corn I use one pint of salt. The corn is put in the inside pan and water turned on, from the tank that sits above it, until the corn is covered so deep that it can boil 12 hours without getting dry. A light lights the room and a furnace burner is under the cooker. When the corn is ready to feed the fire is turned out and the hot water drawn off into the slop tank, which is high enough up to run the slop through two-inch pipes to the hog troughs in the yard outside the building. Cold water is then turned on to the corn and allowed to stand while the hogs are drinking their warm swill. I run the slop into two troughs by the aid of pipes and valves. The slop is made rich by the addition of shorts and milk. The hogs are called to drink by a whistle blown by gas pressure, and they drink and eat in a shed out of the weather. When the corn is cooled off the pan is hoisted up by ropes and pulleys and set over the feed mixer, where the corn is dumped, then sprinkled over with shorts and shoveled over until it is dry instead of wet and sloppy. It is salted to taste, warm, soft and very palatable and eagerly eaten. One-half the troughs are inside the building so the feed can be shoveled in to them without the hogs getting in the way. These hogs are the sows and gilts. The boars are kept across the yard below the orchard, and slop and feed is transported to them in a barrel on wheels. The hogs are fed three times a day, besides having roughness. The hoghouse that the sows sleep in has a plank floor over a foot of shale and in the shale under the floor are three six-inch gas mains that run the whole length of the building and return again, then pass up through the roof into a stand pipe. The house is eight feet wide and the six pipes run close together. A small jet of gas is burned in each pipe, and they get hot their entire length, thoroughly warming up the shale around the pipes and always keeping the plank floor just warm enough to be comfortable. No bedding is used, and the hogs and pigs do not pile up to sleep, but stretch out separately and enjoy life immensely. A single valve controls the heat in all three pipes and is turned up or down as the weather demands. The house has plenty of light and ventilation. The tank of water in the feed building supplies the sheep, cattle and horses in their respective yards, and is pumped from the well by the gas engine that runs my corn thrasher outfit.

In the hogyard I have pipes laid to burn trash with, and ashes and charcoal are thus always on hand, and the same pipes run the big traveling thrasher during our annual thrashing. The sheep shed, cow barn, thrasher building and horse stable are well supplied with gas jets, and I can thrash out an acre of corn after dark just as well as in day time, even though a great storm is raging, as beside the thrasher building is another one that always is kept full of bound corn. I have a stove in the long henhouse, and the only things that are not supplied with light and heat are the two herd boars and their numerous sons that are kept below the orchard, and about 200 yards away from the sows. If they needed it I should supply them with it. I have a wrapped hose that has a patent touch valve and it is used to blow up bicycle and automobile tires with gas, which does not injure the rubber. My boys have rooms of their own that are well lighted up, but they prefer to go out to the shop at night and parch corn and eat apples. They are fond of lighting up the thrasher room, starting the gas engine and pumping the tank full of water from the sheet water well 160 feet deep. We can thrash corn and grind it all at once, or do either separately. This cold, stormy morning is harsh outside, but inside the house and buildings 'tis like a "midsummer night's dream." J. C. NORTON.

Allen Co., Kan.

OLD FRENCH ORCHARD TREES.

Conspicuous objects in the scenery of the Straits country between Lake Erie and Lake Huron are the old French orchard trees. Some of these trees for size and productiveness are truly remarkable. A girth of eight and a height of 100 feet are not uncommon, and crops of 100 bushels to the tree have been known. The illustration, Fig. 393, shows one of these monarchs, an apple tree, the oldest and largest in the region, now growing in the pretty little city of Monroe, south of Detroit, famous for its nurseries. These magnificent trees, the crowning glory of the old French farm and orchard, are fast disappearing; partly from neglect, partly from old age, but more often swept away in the relentless march of modern improvement. From these trees, now nearly fruitless, and hoary with the moss of age, once came the golden, crimson and russet fruits that made the Detroit and the Rouge and Raisin River sections famous for their orchards. Here originated the Detroit Red, the Roseau of the natives; the Detroit Black, more famous; and some others of lesser note. From here were disseminated the Reinettes, Calvilles, Bellefleurs, Etoiles, the Drap d'Or, and the many strains of the Pomme de Neige, our delicious Snow. Downing has over a hundred of these Gallic names. Few pomologists appreciate the work done by the French colonists in Americanizing European apples.



A VETERAN APPLE TREE. FIG. 393.

Quite as interesting are the pears. The French farms were in strips, each of which possessed several of these fine pear trees. One specimen must surely have satisfied the wants of a family, however, as 50 bushels were a not unusual crop. Unlike the apples, there seems to have been but one well-marked variety. The fruit of this is of medium size, lemon yellow with a lively blush cheek, pyriform; with a crisp, breaking, juicy flesh, and a sweet, rich spiey flavor. Not the best for dessert, but unsurpassed for canning, drying and preserving. This truly deserving pear seems destined not to be perpetuated. Attempts have been made to grow and to sell the young trees, but all have failed, chiefly because it takes 20 years to come into bearing. The leisure-loving French fruit grower could wait; the impatient Yankee will not. Another quarter century will see the last of these noble trees, illustrious memorials of early western fruit growing —trees unsurpassed the world over—and we shall have not even a distinctive name to commemorate them in our annals of horticulture. The origin of the old orchards is shrouded in mystery. Records show that some of them were planted more than 125 years ago. Tradition says that the trees were brought from France to Montreal; thence to the Straits. But young plants could hardly have withstood the long sea voyage and the subsequent trip in canoe or batteau. It is scarcely probable that the trees were grafted, for that art could have been but little understood by a people skilled only in trapping and boating. It is more probable that the seeds were brought from France. True varieties are supposed not to come from seed, but the sorts named are fairly fixed as to type in the seed and their not coming exactly true would account for the great number of strains.

Michigan Agricultural College. W. P. HEDRICK.

CEMENT STABLE FLOORS.

PART I.

Much interest is now manifest over the use of cement in stable floors. How does it compare with plank in cost, safety and durability? How may it be built most cheaply, and at the same time permanently, is a question of daily occurrence. It seems to me fortunate at this time that lumber is comparatively high and cement comparatively cheap, while formerly the reverse was true, and farmers were slow to make changes when hemlock plank could be purchased for $8 to $10 per 1,000 feet, and imported Portland cement cost $4 a barrel. Such prices made the comparative cost of cement nearly or quite double as much as a plank floor ordinarily built. Its durability therefore was secondary in consideration. The actual cost of the permanent floor will depend somewhat upon the nicety with which the work is done, and whether or not the labor is all performed by skilled men. One skilled man with cheaper labor to follow will do well, or if the farmer himself can take the lead the work will be even cheaper than a plank floor. A perfect job done by a skilled man will cost nearly twice as much. Much prejudice exists against its use because it is cold; sure enough, cement, metals and stone are good conductors of heat, not that they are in and of themselves cold. We place the hand upon these substances and it feels cold until the heat of the hand has warmed the block through, while against wood or paper, non-conductors of heat, the feeling is soon warm, and we say wood is warm. Cement is also slippery. Yes, that is true if improperly finished. So, let us consider the methods of construction which will lead to a permanent and satisfactory floor.

In many localities drift stones are found; small "hard-heads," so-called, that will make a good foundation. After leveling the earth, and if it is a loamy soil treading or tamping it solid, a coating of these small stones may be hand placed about five to six inches thick. Hand placing seems necessary rather than shoveling them off without regard to location, for the reason that if the location of one to the other is not solid and firm we shall have a cracked surface eventually. They should also be laid to a line on top, so that when the cement is run into these crevices we shall have a smooth surface upon which to spread the finishing coat. The cheaper grades of cement, water lime, and the like, are just as good for the grouting mixed about one part cement to four or five parts sand made thin enough to run into every space and adhere to every portion of the surface of these small stones. Of course the grout can be placed directly upon the earth and be equally as good, but it will need be as thick as stone and cement together, and hence much more expensive. Where crushed stone or clean large gravel is easily and cheaply found, a good foundation, saving much cement, may be made of one part cheap cement, five parts coarse sand and five parts gravel or crushed stone, thoroughly mixed and spread to a depth of four inches; at least that depth wherever animals stand or walk. Of course walks and floors of light work may be if necessary more cheaply built. The finish coat of Portland is added to the surface in this case as noted when the large stones are used for grouting.

Many otherwise well-done jobs are ruined by dirty sand. Make no mistake, even if necessary to haul long distances in order to get a clean, sharp sand. This trouble has in my observation been most frequent when the work was done by an amateur. There is no reason why one may not do the work himself if he knows how. Otherwise get a competent man who will positively refuse to use any but a coarse, sharp, clean sand. Better use a sand so coarse that sifting is necessary to free it from coarse gravel than to use the fine salvy stuff so often found in the sections where the clay formations border on the sandy, loamy soils. Probably it will always pay to sift the sand; it will run better in the grouting, and finish much better in the last or surface coat. H. E. COOK.

PLOWING COW PEAS.—I notice W. L. M's. letter on page 770 about cow peas. Here we wait till after vines are dead, when with one horse they may be plowed, or if too heavy, broken with harrow first. If cows or horses do not like green vines, let them wilt all day after being cut, and soon they will be eaten, even if freshly cut. They have a strong flavor when green (I have tasted them), which leaves them as they wilt, but animals soon learn to like them. E. L. E.

Cheapening the Horse Ration.

What can be fed to cheapen the ration for a horse now that oats and corn are so high in price?

I know of no grain for a driving horse or one that you wish to keep in good condition for driving in the Spring, that can equal good clean oats. I have sometimes fed a mixed ration of oats, cracked corn and bran, equal parts by weight, but would not advise the feeding of this to a valuable road horse that one wanted to keep in good condition for present or future road work. My experience has been that road drivers do not stick for the little extra expense of oats and good care if their horses only show it when returned to them in the Spring. If you have a friend come to visit you, you do not mind the extra expense of good living; so let it be with the horse, one of man's best friends. The best feed is none too good for him. E. C. RYDER.

Middlebury, Vt.

We have always fed oats and bran, and continue to feed the same. We believe that the price of other grain has advanced in harmony with oats, therefore there could be no economy in substituting other feeds in the place of oats. In this State and in other corn-raising States the farmers feed principally corn to their horses, because it is cheaper than oats, and horses can be kept more economically. Corn costs more per bushel, but it goes very much further, so that the same money invested in corn as in oats will last longer. We do not feed corn, because we think oats much better. In regard to feeding brewer's grains we have had no experience, but we do mix a little oil meal with our bran and oats. The horses do not like the oil meal quite so well as they do the feed without it, but after they become used to eating it we think it is a good ration to mix with our other feed in small quantities. M'LAUGHLIN BROS.

Columbus, Ohio.

In my experience of feeding I have not yet found anything to take the place of oats for horses that are working hard, or are being driven fast. It is quite an easy matter to feed horses merely to winter them without much grain of any kind in this country, where we have lots of roots. Turnips are worth about 10 cents per bushel and carrots 12½ cents. I feed hay per day about 24 pounds, 10 cents; turnips and carrots, one peck, 2¾ cents; oats, four pounds, six cents; bran, two pounds, eight cents; total 20¾ cents. This amount will winter a 1,500-pound horse so that it will keep in fairly good condition. I do not approve of feeding much bran to driving horses or horses that are working hard; I can get better results from one pound of oats than two pounds of bran as regular feed for working horses. I consider bran more of a regulator than food. I have never tried distiller's grains, but have tried refuse of mills, such as mill seeds and oat dust, but don't consider it good horse feed. THOS. SKINNER.

Mitchell, Ontario.

New England Apple Questions.

D. A. K., Waitsfield, Vt.—1. How can we prevent bitter rot in apples? 2. How can we prevent the entire destruction of our apple crop by the Apple maggot or Railroad worm? I can plant, fertilize, prune, spray, graft, thin, pick, pack and market to my satisfaction and that of my customers, but all to no purpose if I cannot conquer above troubes.

ANS.—1. Bitter rot (Gloeosporium) may be held in check by spraying systematically with Bordeaux Mixture, followed by the ammoniacal solution of copper carbonate, or by sulphide of potassium (one-half ounce to one gallon water) toward the close of the season. Diseased leaves and fruits should be gathered and burned. This treatment may not prevent all trouble, but will certainly be found helpful. 2. The Apple maggot or "Railroad worm" (Trypeta pomonella) is the most serious pest the orchardists of New England have to meet. The only satisfactory preventive measure is to destroy infested fruit. For this reason many growers find the use of hogs or sheep in the orchard a very great advantage. Clean culture is advisable and refuse from cider mills and fruit cellars should be burned.

Maine Exp. Sta. W. M. MUNSON.

Is Beet Sugar Valuable?

H. E. M., Penn Yan, N. Y.—A few days ago I had occasion to buy a barrel of sugar. As beets are grown here for sugar I wanted to buy beet sugar and help our own home industry. One dealer said: "I would not use beet sugar, because it stinks." He did not say what it smelled of, but the sample shown at the Pan-American tasted and looked just like cane sugar. Another dealer said beet sugar would sweeten only half as far as cane sugar. He claimed he had tried it by making syrup from the same quantities of each, and the beet syrup had only one-half the body of syrup made from cane sugar. How is this? Are we raising sugar we cannot use? If beet sugar is as good as cane sugar these grocers should take a lesson in political economy, and sell goods grown at home rather than imported sugars.

ANS.—There is something the matter with those grocers. Refined sugar from the beet and from the cane is chemically the same. Each has the same sweetening power. What is known as glucose is a substance made from corn, and it has much less sweetening power than the sugar from cane or beets. The unrefined sugar from beets is not equal to that from cane, but when refined the sugars are fully equal. A large proportion of the sugar used in this country is beet sugar—coming from Germany and France. American refined beet sugar is as good as any sugar made in the world.

Plum Stock, Evergreens and Wind-breaks.

G. M., Johnstown, Pa.—1. What is meant by "Lombard stock?" Is it Lombard plum trees raised from seeds of Lombard plum? 2. What are the best evergreens to plant for wind-breaks? 3. What are the best quick growing trees for wind-breaks? 4. How are Lombardy poplars propagated? 5. On our heavy western Pennsylvania soils, which are somewhat rocky, can we successfully use the Cutaway disk plow and disk harrow?

ANS.—1. The Lombard plum reproduces itself fairly well from seeds, but seedlings are too scarce to be used extensively for stocks. It makes a splendid tree for top-working with other plums, but when used for that purpose is usually grown in the ordinary manner by budding or grafting on the Horse plum, Myrobalan, or some other common stock. 2. The Norway spruce and Siberian arbor vitæ are the most useful evergreens for wind-breaks in your latitude. The American arbor vitæ or White cedar is cheaper and a more rapid grower than the Siberian species, but is more brittle and open in growth. The native hemlock makes the finest and handsomest of wind-breaks, but is too slow and difficult to establish for ordinary use. The basket worm is often very destructive to the arbor vitæs, so that on the whole the Norway spruce planted in double or triple rows would be the safest evergreen to use. 3. The Carolina poplar cut back to branch near the soil is probably the best quick-growing deciduous tree for the purpose. Other suitable trees are the Soft or Silver maple and the Golden willow, Salix vitellina, but both should be cut back and kept closely pruned to keep the wind from near the soil surface. 4. Lombardy poplars are usually grown from hardwood cuttings in the same manner as currants or willows. The cuttings are taken in Fall or early Winter, made into bundles and buried in the ground until Spring. They are then set in rows in well-prepared soil, the rows being far enough apart for horse cultivation, and the cuttings about 10 inches apart in the row. In two or three years they will be large enough to transplant. 5. We have not been able to use either disk or Cutaway successfully on very rocky soil. Where the stones are small and round the tools do fair work, though the teeth and edges of the disks are easily chipped and dulled. On soil covered with flat stones the tools will not answer. In our experience the spring-tooth harrows are better for such locations.

More About Mr. Hitchings's Orchards.

L. C. S., Albion, N. Y.—I have been greatly interested in reading of G. G. Hitchings's success with apple trees in sod, and would like him to explain a few things. Does he ever plow or cultivate the ground, and what kind of grass does he raise on it? Does he mow the grass for a mulch, or in what way does he add fertility to the soil? Does he use chemicals, and if so, what? He speaks on page 802 of "nourishing the buds during Summer and Fall." What does he mean by this expression, and how is it done? An explanation of his methods would be of interest to many in this locality.

ANS.—If you have straw or any vegetable matter to mulch trees when first set to keep them from drying out, don't cultivate. If you have no available mulching material, then cultivate up and down the rows a distance of four feet each side of the row, thus forming the earth mulch to hold moisture. Keep up this cultivation until grass growing between the trees is large enough to mow; then place this grass around the trees. Continue this practice of mulching with grass each year, gradually extending as trees grow for 10 years; then let lie where cut. You will find at this time that you have accumulated a good supply of humus, and by its gradual decay plant food is furnished in sufficient quantity for good annual crops of fruit without the addition of any other fertilizer. In a young orchard just set seed with equal parts of Red clover, Timothy and Red-top; in an old orchard with Red-top alone, and this humus supply for old orchards must be helped out by the addition of manure, especially if previously cultivated. The clover in young orchards improves the texture of the soil, the Red-top finally takes its place and makes a fine thick aftermath like a carpet, which protects the roots from excessive heat or cold. You have probably noticed that manure applied for corn on sod ground in the Fall was more effective than a similar amount applied immediately before planting in the Spring. I am of the opinion that the bacterial action of the soil was encouraged by this practice. The same thing occurs by a mulch in an orchard during the Fall. You are releasing plant food by aid of these bacteria at a time your tree needs it most to give strength and vitality to the fruit buds, so that they may be able to set and perfect a crop of fruit the following year. By examining the soil under the mulch we find the feeding roots close to the surface. They appear very healthy and vigorous, and I believe they are the ones that are doing the tree the most good, and should be nourished and fed by decaying plant food and not mutilated by a cultivator. Last Summer I observed that many of the orchards along the line of the railroad from Buffalo to Niagara Falls looked unhealthy. I think it is a case of cultivator disease.

EVERYBODY'S GARDEN.

I would like to ask some questions about onions. I have works on onion culture and Onions for Profit, but they do not analyze my case. I have now bedded 10 bushels of potato; onions, six bushels large, and four Potato onions, six bushels large, and four 25 cents per dozen bunches, of three onions each. Our market prices now are $1 per bushel, and $2 for sets. 1. How should I grade my onions for planting? 2. Should I plant the large, or use those medium in size for raising sets? 3. Would it pay best to sell the large sets, and plant only small ones (in doing this they would be classed as large ones)? 4. In a cluster of three to six large enough for bunching is it advisabe to pull the whole bunch or leave one standing to mature? Our season was poor and I planted without regard to size. G. H. T.

Bloomington, Ind.

I quote the clause referring to the price obtained for bunching onions, as a matter of personal interest. The growers here would consider that an average price of 25 cents per dozen would be a very large price; one-half that amount would I think be more than is averaged here for the whole season through, and bunching onions should certainly be a money crop for our correspondent. 1. If, as inferred from the letter, the stock is the Multiplier or Potato onion so largely grown in the South, they should be graded, as only the larger bulbs will multiply, while the sets will produce large onions, but will not multiply. 2. Plant the large ones if you desire to keep up your stock, as the small ones will not multiply and you would be minus your sets, provided only small ones were planted. 3. This is practically answered in preceding, but it must be borne in mind that both large and small must be planted each year in order to keep up both the bunching, and set supply. 4. It would be better we think to pull the entire bunch, as the one left standing would be liable to be stunted in growth so it would mature only a bulb inferior in size at best, and the ground would require the same care the whole season through as it would to grow a full crop. As fast as the ground is cleared of the bunching onions it had better be cleared entirely and used for some other crop. However, bear in mind that some of the bunching onions must be left to mature, else you will run out of your crop of sets for the next year. To sum all up, keep these two facts before you. The large onions will multiply and produce your bunching onions, while the sets will produce your large onions, and both must be planted each year to keep up your supply. These two facts will decide you at once as to what you can keep or sell. Plant the large and small separately so that in harvesting, one kind will not interfere with the other.

A WISE DECISION.—C. P. B., Calumet, Mich., writes: "I have decided to subscribe for THE R. N.-Y. for one year, and enclose $1, I hope to receive the paper regularly and would be glad to learn of anything new in the line of improved agricultural machinery, etc." This is certainly a wise decision and thousands more should be like-minded. C. P. B. may rest assured that the paper will reach him regularly, and I know of no more reliable source of information as to improved farm machinery than the advertising columns of this paper. The standing announcement, "A Square Deal," on the editorial page is a sufficient guarantee of the reliability of the advertising patrons.

HOTBED MANURE.—It is just the right time now to begin to save manure for the hotbeds. Many act on the principle that anything in this line will answer, but the practical gardener fully knows how much of success depends on the best quality of manure, properly stored and prepared. If nothing better can be done, cow or mixed manure with considerable coarse litter will answer, but the best results will be obtained from clear grain-fed horse or mule manure. When a large quantity is required it is none too early to begin at once to save and prepare it. It should be stored secure from snow and rain, and forked over often enough to prevent burning or fire-fanging, as that seriously impairs its heating qualities. Freezing will not injure it provided it does not freeze sufficiently to prevent using when required for the beds. In forking over, all chunks should be thoroughly broken up, and all knots and bunches of coarse litter should be thoroughly shaken out. When cow manure is used more coarse litter should be mixed in than when horse manure is used exclusively. An ample supply should be prepared, for it is the mainspring of success in the hotbed work, and the mistake of a shortage is not easily rectified. J. E. MORSE.

Michigan.

Treatment for Apple Trees.

G. A. B., Clyde, N. Y.—I have about 500 apple trees three years old. The land is somewhat gravelly, and in fairly good condition. A year ago the land was covered with manure and sown to wheat, and in the Spring was seeded to Medium clover, which made a very heavy growth the past season. What treatment would you suggest the coming year? Shall I let the clover grow, cut a crop of hay, and plow under the rowen, or would you advise plowing under the clover the last of May, planting to beans, give good cultivation, and then sow to rye next Fall and plow that under the following Spring for some cultivated crop? Advise me as to the future treatment of the orchard.

ANS.—The growing of a crop of wheat in this apple orchard was a mistake, as it has been in many others. Not long since I saw a young apple orchard in the famous Blue Ridge country of Virginia that had been sown to wheat for two years past, and with serious effect. It has been stunted in growth. As the orchard of G. A. B. is now in clover, my advice is to plow it under early next Spring and put in some crop that will require cultivation during the early Summer. Potatoes would be a good crop. Beans might be put in after the ground had been tilled without any crop for several weeks. In no case would I cut and take off a crop of forage. Oats might be a good crop to sow next Fall for a Winter cover, but rye would live until the following Spring and might not be plowed under soon enough. No crop should be allowed to sap the ground of moisture at that time of year, especially.

VERMONT DEER.—Having printed complaints about the damage done by wild deer in Vermont it is no more than fair that we should also print the following from the Brattleboro Phoenix:

"Twenty-five years ago deer were extinct in Vermont, except in the northeast corner of the State, where the primeval forest stretches away to the great timber tracts of New Hampshire and Canada. Enterprising sportsmen from Rutland and vicinity brought from other States a few deer and liberated them in the mountains east of the Marble City. These deer were protected by stringent laws, they multiplied rapidly, and they gradually found their way to other sections of the State in small numbers. They have, however, never become numerous except in a few towns near where the deer were first set free more than 20 years ago. In fact, more than one-half of the 544 deer shot since an open season was established in 1898 have been killed in six or eight towns in Windsor and Rutland counties within a radius of 30 miles of the spot where the Rutland sportsmen started the experiment of stocking the State with deer. A few farmers in the wildest sections of Windsor and Rutland counties may sustain a slight damage to crops from the incursions of hungry deer, and similar conditions may exist in wildest Essex County, but not one Vermonter in 30 ever saw a wild deer in the State, and not one farmer in a hundred ever had his crop damaged by the animals."

OUR SYSTEM THE BEST!

A FULL **Pound** Powder AND A **25c Bottle** OF **Flavor,** All For **20c** Sold formerly AT 50c

Talk as you will, **BARGAIN and MERIT Is what Sells Goods!**

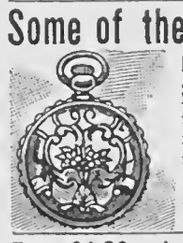
EVERYBODY WILL BUY!

Of course they will. What could they say that would give them an excuse? They cannot say that our **Baking Powder** is not the best in the world. They cannot say that you are not giving them double the amount for their money that anybody else gives. **No, certainly not!** This is what the most of them will say: "I will take 3 lbs. with 3 bottles," and another, "I will take 6 lbs. with 6 bottles."

Now we've told you about our splendid BAKING Powder. **We shall tell you now** that we want you to sell it for us. If you can't sell a thousand pounds, sell what you can. We will ship as few as **36** lbs. If you do not want a **Premium**, you can take **100 Percent Profit**; you can keep **half** of all that you sell.

We have **Order Sheets** and **Premium Lists**; but they are not necessary. If you will direct your order and letter carefully to us, you can depend upon *immediate* shipment. If you wish the Order Sheet and Premium List with any special information, write us, giving your name and address plainly written. We have endeavored to make our offer and plans plain, so as to get you into the work with least possible delay.

Some of the PREMIUMS We Give.

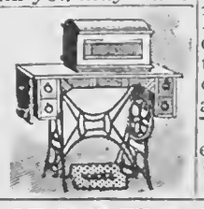


For a $3.60 order, choice of a
Set Silver Knives and Forks,
Boy's Suit, 6 to 12 years,
Mandolin, or Guitar, or Violin.
Lady's or Gent's Watch,
Hanging or Stand Lamp,
XX Ice Cream Freezer,
Pair Lady's or Misses' Shoes.

For a $4.80 order, choice of a
10-piece Toilet Set,
22-piece Dinner Set,
30-piece Tea Set,
Lady's Silver Watch,
Lady's Gold Plated Watch,
Lady's Parlor Rocker,
Morris Chair, Rainy Day Skirt.

For a $7.20 order, choice of a
60-piece Dinner Set,
60-piece Tea Set,
Edison Hanging Lamp,
8-day Parlor Clock,
Man's or Boy's Suit,
Our Best Rainy Day Skirt,
Fancy Metal Bed.
★We can give an estimate on any Premium you may want.

For a $12.00 order, choice of a
112-piece Dinner Set,
High Arm Sewing Machine,
Fine Upholstered Couch,
Fine 3-piece Parlor Suite,
Solid Gold Filled Watch,
28-inch Bicycle (Special),
A Large Sideboard.



Extra Terms to Ministers' Wives.

OUR SYSTEM THE BEST!

Our Terms On this plan are made exceedingly liberal. You may send one-half the amount of money that an order calls for along with your order, the remainder you can pay any time within 30 or 60 days, for which we shall ask no security whatever. (That we will provide for.) If it be a $4.80 order, you can send $2.40. If it be a $14.40 order, you may send $7.20. If you wish to send the full amount to save correspondence and postage, a set of heavy plated Teaspoons will be given on smaller orders, and a set of Tea and Tablespoons on the larger orders as a recompense for cash. If you are not able to send any money with your order, a merchant, postmaster or banker may sign your Letter of Credit that you have 30 days' time to make returns in full.

LADIES' DESKS.—We have 20 different styles, including Roll Tops. Can give Book Case or Writing Desk for an **$8.00** or **$12.00** order, or Roll Tops for **$15.00** order.

☞If you have seen the illustration and price of a Desk to your liking, send us the sheet and see how we will save you money.

We have 100 Styles of Baby Cabs, Go-Carts and Buggies. Given on orders from *$4.80* up to *$15.00*. Write for special terms. We give a splendid **Cab** or **Go-Cart** to any lady who will secure two agents that will send us a *$12.00* order each.

Money is not required to do business with us.

Our **Bedroom Suites** are the greatest of all inducements. A full 3-piece Set—Bedstead, Dresser and Washstand—for a *$12.00* order. Our No. 60 for *$20.00* order, and our Finest for a *$30.00* order.

Our work as offered is a dignified one; there is no beggary. You allow Free the choice of *20* different Flavors—Lemon, Vanilla, Peach, Rose, Nectar, Pineapple, or, in fact, any kind they may call for, with every pound of Powder which you sell for *20c.*

For a $36 00 order,
Our Capital Premium,
Caligraph Typewriter,
(Nos. 2, 3 or 4).
These machines sell for $100 by the manufacturers.
Special terms to Aid Societies, Lodges, etc.

NOTICE EXTRAORDINARY!

A Beautiful **Silver TEA POT** Extra will be given on all orders of **$12.00** or more where the money is sent with the order, or a Set of Silver **KNIVES** and **FORKS**, if preferred.

☞ All money refunded if everything not as represented.

ADDRESS PLAINLY:

THE CREAM TARTAR CO., CINCINNATI, OHIO.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

SOME TOMATO TESTS.—We try many new tomatoes every season, but find too much space required to grow the multitude of new varieties sent out every Spring. The tomato has been worked up to great perfection in a short period, and though one of the most responsive of plants to horticultural influences, it cannot be expected to retain the same rate of improvement in the future. The new kinds sent out annually by seedsmen are very much alike, according to the type represented, but are often superior to existing strains in that they are carefully selected for special qualities, and, we may venture to say localities, in view of the enormous geographical range covered by American gardening operations. Aside from these seedsmen's varieties we always get a few of home development from readers of THE R. N.-Y. We grow them with much interest, as they generally have some special excellence, though many of the qualities that go to make commercial value are often absent. The following appeared most promising of this class:

EARLY PURPLE.—Wm. Rapp, Terrehaute, O. Planted out May 21. Strong and vigorous plant, fairly productive, large flat tomatoes, dull red in color. Pleasant quality, but too soft for market. Second early.

LATE PURPLE.—Wm. Rapp, Terrehaute, O. Planted May 21. Not so rank in growth as the former, but more productive. Large, flat and rather soft. Color, deep purplish red. Very good quality. Late midsummer.

DWARF CHAMPION TYPE.—G. M. Mack, Nicholson, Pa. Planted out May 23. Exceedingly dwarf and compact, dense dark green foliage, so thick that it must be cut away from lower clusters to secure early ripening. More productive and of brighter color than Champion. Midseason. Under high culture makes a fine variety for small gardens.

FIVE INTERESTING HYBRIDS of the very distinct variety Honor Bright were received from E. C. Green, Medina, O.; some with broad or potato-like foliage, and red or purplish fruit, others as dwarf and compact as Aristocrat or Champion. All retained the peculiarity first developed in their parent of coloring the green fruits first white, then yellow, then scarlet or crimson purple, as the case may be. All had the characteristic yellowish foliage of Honor Bright, though it varied much in form. This yellowness seemed to be so much accentuated by wet weather as to amount to weakness, though in average seasons Honor Bright is vigorous enough. The quality in most cases was very good when thoroughly matured. The various shadings of the fruits in the different stages of ripeness are not only very handsome, but serve to indicate the time for gathering in case they are to be shipped. All were firm enough to handle readily, and proved sufficiently productive considering the unfavorable season. Early to medium late.

ENEMIES OF THE PERNICIOUS SCALE.—The recent announcement from the National Department of Agriculture that the natural parasite of the pervasive San José scale had been discovered in north China, in a region supposed to be the original home of the scale, in the form of a Chinese "lady bug," is very encouraging, and we shall all be glad when the distribution of these hardy and energetic little beetles begins, as accumulating experience makes it plain that the extinction of the pest by sprays and chemicals is a laborious and uncertain matter. Crude petroleum and potash whale-oil soap, so often recommended in these columns, remain the only practical means for clearing infested trees, but it must be remembered that these powerful insecticides are alike fatal to friend and foe—they kill the beneficent parasites, if present, even more readily than the well-armored scales—and should only be applied in late Winter, when insect life is dormant. We find the handsome little native Twice-stabbed lady beetle increasing on the Rural Grounds, and gathering on the few trees that become infested with scales each Summer. They stick closely to the trees, remaining until hard freezing weather, and may plainly be seen dining on the minute scales on sunny days. If removed to adjoining trees free from scales they soon leave and presumably find their way back to their lunch counter. They do not breed fast enough, however, in the opinion of Prof. John B. Smith, of the New Jersey Experiment Station, to become an important factor in exterminating the scale. It is to be hoped this Chinese cousin, with its countless generations of hereditary experience in dealing with scales behind it will prove adapted to our climate and conditions. Now is the time to make a thorough examination of all trees and shrubs likely to become infested, so that thorough work may be done with the spray pump in the hurried days when the swelling buds indicate the safest time for oily applications. Other parasites of microscopic size have been reported as preying on the Pernicious scale, and it is possible that natural enemies of this character may so increase as materially to check its spread among wild plants, but cultivated trees will doubtless require special attention and vigorous treatment when infested for a long time to come. In the light of our own experience, and in consideration of the importance of the subject, we make no apology for repeating the advice closely to examine all trees and shrubs about the farm, and send specimens of infested twigs and bark to the nearest Experiment Station if in doubt as to the character of the pest. If identified as Pernicious or San José scale it will be well to head back severely just before growth starts, coat the large wounds with paint or shellac, and spray thoroughly with petroleum or whale-oil soap solution, (two pounds of soap to a gallon of warm water) when the buds show signs of swelling. We use the oil pure on trees showing any incrustation of scales, and the soap solution when only scattering young scales can be detected. The oil is most effectual, and is visible for nearly a year, limiting the spread of any scales that may be missed for that time, but it is known to be more dangerous to the tree, though we never have had any ill effects. The object of pruning is to reduce the surface to be treated, as it is not easy to coat fine twigs completely with oil or thick soapy solutions without getting an excess about the trunk. The trimmings should be piled in some convenient place and left until late May or June to allow any insect parasites to escape, and then burned.

W. V. F.

THE OHIO HORTICULTURAL SOCIETY

PART I.

The thirty-fifth annual meeting of this society was held at Lancaster, O., December 4-5-6. The weather being fine, the attendance good and the programme of more than ordinary interest, the convention was a success in every particular. The reports from members of the various districts of the State, indicated a variable crop of apples, probably averaging 50 per cent of a full crop. However, those who grimly maintained their grip on the pump and nozzle and kept their poisonous Bordeaux fog flying, were richly rewarded. The Cox Brothers, of Lawrence County, who make a specialty of growing Rome Beauties, reported a moderate crop of very fine apples—aggregating 1,700 barrels. The last of their fancy grade of Rome Beauties sold for $5 per barrel. Notwithstanding all that has been said against the Kieffer pear, reports from nearly all sections of the State place it at the head of the list for profit. Kieffers, this season, sold from $1 to $1.50 per bushel, and the demand was not satisfied. Peaches were reported a heavy crop from all sections of the State. Young trees and those from which much of the fruit had been thinned, produced fine specimens that sold from 75 cents to $1.50 per bushel, while unthinned trees were broken under their great burden of undersized fruit that could be purchased for almost any figure from 50 cents down. The plum crop, though variable, and affected seriously, in some localities, by rotting, was above the average. The Japan varieties had their second inning, in our State, since their introduction. The first crop of Ogon, on trees planted nine years, was reported. They were large, beautiful and of fair quality, but the liability of the bloom to be killed by late frosts makes them unprofitable to grow for market or home use. Burbank bore well, but rotted badly in many places. It is the general verdict that although the "Japs" are very attractive in form and color, and sell fairly well, they cannot compare with our better European varieties. The Bradshaw is undoubtedly at the head of its class as an early plum. Lombard holds its own as a reliable general-purpose variety. Imperial Gage was mentioned as having done well the past season, and is highly appreciated for its fine quality. Richland was quite favorably mentioned by those who have tested it. It is said to be superseding the damson wherever it is becoming known. Archduke, Grand Duke and Monarch are recognized as leaders among the large, late plums, and promise to be a source of profit because of their season of ripening and comparative freedom from rot. G. W. Gill of Columbus, described a new plum, or rather an old one that is just becoming known outside the neighborhood in which it originated. The original tree came from a seed planted in 1825. Mr. Kelso, for whom the plum has been named, purchased the farm, on which the old tree was still alive, in 1866; since which time the variety has become a local favorite among the farmers of Sabina, Clinton Co. The Kelso is a dark blue in color, from one-third to one-half larger than the damson. In form it is nearly round. The flesh is a rich, dark red. It is a freestone with a seed smaller than the damson. It is said not to suffer from the eureulio, and is not susceptible to black knot. Another member stated that he knew the Kelso, and that it is promising for home use and market.

For the land's sake, use Bowker's Fertilizers. They enrich the earth.—*Adv.*

BOTTLE BABIES

Bottle babies are so likely to get thin. What can be done? More milk, condensed milk, watered milk, household mixtures—try them all. Then try a little Scott's Emulsion in the bottle.

It does for babies what it does for old folks—gives new, firm flesh and strong life. You'll be pleased with the result. It takes only a little in milk to make baby fat.

We'll send you a little to try, if you like.
SCOTT & BOWNE, 409 Pearl street, New York.

DIETZ Does It!

DIETZ LANTERNS

are always cleanly, safe, neat and strong; yield abundant light; will not blow or jar out; burn little oil, mechanically perfect.

HOPE FARM NOTES

WATER SUPPLY.—I have often told about our water system but every now and then a new reader asks questions like the following:

I see that the Hope Farmer has a system of water works on the farm. I would like to know what kind of power he uses. I see mention of a windmill. I would like to know what he does to pump when the wind does not blow, and how does he work it in the Winter? What kind of a supply has he, a spring or a well, and about how much will it cost to build one like his? How much land will a windmill irrigate? I mean to grow a crop. It is a dry country out here, and I think we would help to grow a garden. T. M. H.

It is an old story to most of us that when we bought Hope Farm there was no drinking water at hand. An old well near the house about 80 feet deep had never been satisfactory and had been filled up. There were two big cisterns for rain water in the cellar. On the hillside about one-third of a mile from the house is a fine spring. My first plan was to pipe this spring water to the house and barn. At that time iron pipe was so high that I gave this scheme up. I knew that a good water supply would increase the value of the farm far above the actual cost of supplying it. The result was that we engaged a man to drill a six inch well. He struck solid rock at 16 feet, and tapped a water vein at about 90 feet. I intended to stop at about 100 feet, but through some misunderstanding he kept on to 140 feet, the water finally rising to within 40 feet of the surface. This gives us an abundance of pure water—better, I think, than that from the spring.

WATER WORKS.—It is all well enough to have plenty of water 40 feet below ground, but one might die of thirst unless it is brought to the surface. I am not satisfied with merely bringing it to the surface either. It should be hoisted above ground and stored there so as to run where you want it. You elevate a boy's spirits and he will run his legs off on your errands. In like manner if you elevate water it will find legs to run to barn or kitchen far ahead of the men folks, who are asked to carry it in buckets. Our well is located in the barnyard. After some figuring I decided to buy a windmill, which was put up over the well. Just under the roof of the barn we put a wooden tank holding 1,300 gallons. An inch iron pipe runs from the pump at the windmill up through the barn into this tank. A short distance from the pump a branch pipe runs to the house, entering through the cellar wall, and by means of a water-back in the kitchen range giving us hot water in the kitchen. We expect later to put a smaller tank at the house, and arrange for a bath room. This system has worked well. The windmill has now been in operation 26 months. During that time the tank has been dry so that hand pumping was needed only twice. In one case it was our own fault, as we neglected to use the wind when the tank was nearly empty. In the other case there was hardly a breeze for nearly 10 days at a time. This was very unusual for our country, and with a larger tank I doubt whether there would be any need of hand pumping. The cost of the whole outfit was not far from $450. The drilling of the well cost $2 per foot, or $280 in all. I regard it as a good investment, aside from the great comfort and convenience which a constant water supply means. I have been asked whether I would borrow the money to put up such an outfit on a farm! In a sense that is just what I did, for the money which this cost might have been used to eat a hole in the mortgage. I felt that so long as the farm was without drinking water it would be slow of sale, with the buyer dictating the price. These were just the conditions which enabled me to secure it at a low figure. I felt that a good water supply would change the condition and give the advantage to the seller. While I do not like to think of selling the farm I consider it a duty to try to make any property rise to its true value. Where a water system must be regarded as a convenience rather than a business investment I doubt the wisdom of going in debt for it. As for irrigation, I have no faith in wind power for providing water, unless one has a very large pond or reservoir above land to be irrigated. I hope some day to use the water from the spring for irrigating.

POSSIBLE CHANGES.—No man is wise enough to start a new plan of this sort and get it right the first time. He may have the best advice in the world, but advice will never spell personal experience. If I were starting the thing over again I might change several things. I think I would locate the well and mill nearer the house, and put cut-off valves in the pipe, so as to separate house and barn supplies. I would have a tank in the house so as to be entirely independent of the big barn tank, which must be cleaned several times a year. I would make the barn tank at least three times as large. My mill wheel is 10 feet in diameter. I would get a larger one, and have it geared so as to run some other machinery. With this outfit I could put a power house over the well and run light machinery on windy days. I am not sure that I would get a mill were I starting again. I like the portable gasoline engines. They can be mounted on low trucks and wheeled about from one part of the farm to another for all kinds of work. We could use one to pump, run the saw or shredder, or grind. This is the way the gas engine looks to me at a distance. I have before now spent time and money running after new and promising friends, only to look back and see that the old friends were, after all, the best. Some of these old friends resented my running from them and turned a cold shoulder when I came back, but the old windmill will continue to harness the wind at the old stand without complaint.

COMFORT.—I write this on Saturday night. It was dark and gloomy through the afternoon and the sorrowful day ended in tears. We came home in the big wagon in the face of a driving rain. Old Frank hauled us through the mud over the hills and along the level places, shaking himself with a sigh of relief as he halted in the Hope Farm yard. There was a big fire in the wood stove, and Aunt Emma and the Madame were putting the last finger tips on supper. Half a dozen lamps were burning, for our folks like to let their lights shine when they are most needed. The baked beans, Indian pudding and brown bread needed little sauce on such a night after a hard day's work. After supper I went with the Bud and the Graft to see that all the stock was safe and dry. It was well that we went, for there were six foolish hens huddled into a corner with the rain dripping on them. I would give these hens a premium for silliness, were it not that I have known men and boys to get out of a good home for less cause. We soon had them safely in the house. We looked up all our barn friends, and now as I see the great raindrops flatten against the window pane and slide sullenly down I know that all hands, from Grandmother down to the sick chickens in the brooder are safe from the storm. Hope Farm represents "Home, sweet home" to 13 humans and 154 brutes tonight, and every one of them has a full stomach, I hope an empty bag of regrets, a warm nest and cool and comforting memories. I am well content therefore to let the storm cry impotently at the windows because it cannot get inside. The wood fires are roaring, the apple barrels are full, there are three chickens in the pantry ready for tomorrow's dinner—in fact bodily comforts are well provided for. The little folks have had their bath and are now cuddling down for sleep. They have written their letters to Santa Claus and thus all their childish wishes are known. Happily their wishes may all be gratified, for we have been able to keep these little folks satisfied and happy with simple things.

So you will see that the Hope Farm folks are closing the week gently and hopefully. Why, we even have room for a few more should there be any homeless ones adrift in this cruel storm. But some one will shrug his shoulders and say with a half sneer: "Ah! this man would not talk so hopefully of his so-called comfort if he knew what real trouble is. You would hear another story from him if the shadow that rests on *my* home came over the threshold of Hope Farm!"

Now it is close to Christmas, and I feel like taking the privilege which belongs to an old friend of talking right out to you. The Madame and I sometimes think that our burdens are pretty heavy, and that there are several black shadows tied fast to us. The problems of life which are presented to us for solution seem at times overpowering. Were I to write the truth about some of the unpleasant things that have stood in our path you would accuse me of reading a chapter out of a romance. I merely refer to this, here at the end of the year, that those who sit in sad and lonely homes to-night, perhaps communing with some dark and bitter sorrow, may realize that the Hope Farm folks know and understand. It is a part of your duty and mine to carry on our shoulders a portion of the great burden of sorrow and trouble which God has placed in the world. We may carry this as we would a dead weight—a millstone around the neck—or we may shoulder it gloriously as a cross that uplifts rather than bears down. Let us not discuss it or think about it except in the hope and belief that along with it is given the power to turn it into strength and blessing. To those who are hopeful and happy to-night I would say share your happiness with others and thus increase it. There are those to whom this storm brings only haunting memories of grief and trouble. The raindrops flatten on the glass, but the mournful spirit of the storm breaks through and penetrates the very soul. When sorrow clouds the mind there is only one way to remove it, and that is to share another's sorrow and thus destroy the germ! Why refer to these things now? Why not talk about crops? Because we are close to Christmas—the birthday of One who came on earth to give man a new moral opportunity. The Hope Farm man doesn't pretend to be a model farmer, and the Madame wouldn't stand a chance in a contest for a model housekeeper, but as we run back in memory over a good many stormy years we feel more and more convinced that what the people of this land need above all else is the knowledge of this same moral opportunity. H. W. C.

May I Send You A Book?

I will mail you any book from the list below if you send me your address.

With it I will send an order on your nearest druggist for six bottles of Dr. Shoop's Restorative. If you think that you need it after reading this book, you are welcome to take it a month at my risk. If it cures, pay your druggist $5.50. If it fails, I will pay him myself.

This remarkable offer is made after a lifetime's experience. I have learned how to strengthen the inside nerves—those nerves that alone operate every vital organ. I make each organ do its duty by bringing back its nerve power. No case is too difficult. I take the risk in all.

In five years, 550,000 people have accepted this offer; and 39 in each 40 paid. They paid because they were cured, for no druggist accepts a penny otherwise. The decision is left with you.

Note that if my Restorative cures, the cost is a trifle. If it fails, it is free. Can you neglect such an offer when 39 out of 40 who write me are cured?

Simply state which book you want, and address Dr. Shoop, Box 570, Racine, Wis

Book No. 1 on Dyspepsia,
Book No. 2 on the Heart,
Book No. 3 on the Kidneys,
Book No. 4 for Women,
Book No 5 for men (sealed),
Book No 6 on Rheumatism.

Mild cases, not chronic, are often cured by one or two bottles. At all druggists.

THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, DECEMBER 28, 1901.

THE House Committee on Agriculture has fixed January 8 as the date for taking up the oleo bill. This early start indicates a desire to push the bill along, and we hope the force behind it will be strong enough to crowd it over all obstructions.

*

HERE is a business question which will be discussed next season. In consigning goods (fruits or other produce) to commission men in large cities, is it best to let one firm have it all or to divide between several? There are many sides to the question, and we would like many opinions and suggestions.

*

WHY not take a hint from that little blackboard on Mr. Mapes's barn? Have you not something to say to the public? It can hardly be that all your ideas are for home consumption. Let the public in when you have anything to sell or buy. Chalk up your wishes, and thus make sure of the long end of the wishbone.

*

ON page 839 we referred to Elmer E. Hubbard's school in Cuba, and the need of a gardener. Our readers will be glad to learn that the first volunteer for this place has come forward! It is a great satisfaction to realize that whenever we ask R. N.-Y. readers for information or public service some one is sure to respond!

*

WHAT a farmer that was (first page) who raised sugar beets and sold them at $5 per ton and then bought back the pulp at $4.50! He was—but hold on before we express our opinion. Let us all make sure that we never did anything like it. If all waited until that time what a solemn and reflective silence would fall over the world!

*

SPEAKING about the famous "seed oats" case recently aired in THE R. N.-Y., a reader wants to know whether he can make Uncle Sam pay for the damage done by weed seed. This man received some onion seed in the Government free seed distribution, and planted it. The onions were of little account, but mixed with them was a fine lot of weeds which seeded the whole garden! There will be small show for obtaining damages, for Uncle Sam has fooled himself into the belief that he really does a good thing by distributing these seeds!

*

WE find that farmers are divided in their opinion of the Chinese Exclusion Act. Some of them favor Chinese immigration, as they argue that this would provide farm laborers and thus enable them to work their farms to better advantage. We think they would be disappointed in this, for the Chinaman is not likely to go to farms where he would be obliged to work alone. He will stay in town, or else work in gangs on farms large enough to employ a large number. There is no doubt about the demand for good farm labor. Not a day passes that we do not receive a request from some farmer who has been worked almost to a standstill for lack of steady helpers. The situation in England is even worse than here—the workmen crowding to town and city leaving the farmer alone. This seems to be one of the industrial taxes which the farmer in a manufacturing country must pay for his "home market." The introduction of large numbers of Chinese laborers would not be likely to benefit the smaller farmer. It would be more likely to increase his competition, for the cheap Chinese labor would be employed chiefly by the large western farmers, and thus increase their output.

*

THE meeting of the New York State Fruit Growers' Association at Syracuse on January 8-9 will be a notable occasion. This Society is less than one year old, yet it has already nearly 600 members. It won the cash first prize at the New York State Fair, and a gold medal at the Buffalo Exposition. That is doing pretty well for a child barely out of its cradle, but it only suggests the possible power for helpful business which the Society will show when it grows up. This is a business organization, and in no sense a rival of the horticultural societies.

*

LET a man ride through the best dairy districts in New York State after an absence of 10 years, and he will be astonished at the number of silos. We recently saw nine at one time from the windows of a railroad train. New ones are being put up every year, and they are changing the character of farming in whole sections. Years ago the institute speakers argued at length in favor of silage, and for a time they felt that they were making slow progress. The farmers often waited until the speakers had begun to talk of something else before they were ready to build the silo. The speaker must often work years ahead of his audience, but if his words are true he need not be afraid to leave them and pass on, for they will be passed along by those who hear him.

*

THE threatened famine in Russia will be very discouraging to the export trade in cereals, which the government of that country is seeking to promote. Only two provinces out of more than 70 are said to have produced a full harvest, and the area of scarcity exceeds half a million square miles. The Russian government cannot, with any justice, permit an extensive export of cereals in the face of these conditions. It is like China, which the well-informed say, is not likely to compete with the outside world in agricultural products, even when vast areas are reclaimed or restored to tillage, because there is always a vast and increasing population, which, unless cut down by war, must keep pace with the food supply. It is likely that Russia will hasten to open up the grain-growing districts of Siberia, which are described as the granaries of the future.

*

WE have received the following note, which we are glad to make public:

> Acting upon the advice of THE R. N.-Y. that the farmers of New York State write to their Representative in Congress in behalf of the Tawney oleo bill I would suggest that each and every reader of this paper, on the first day of January, 1902, write a letter to J. W. Wadsworth or Sereno E. Payne or both, in behalf of this bill. Let every friend of pure butter take a hand, remember the date, and let's show them the farmers of old York State are watching them with a view to "future reference." E. C. W.
> Bennettsville, N. Y.

That is a good plan for starting the new year properly. This expenditure of four cents will bring sure results. Mr. Wadsworth is said to be looking into the future for State political honors. Therefore every farmer in New York is justified in sticking a postage stamp on his back.

*

A SOUTHERN firm has been operating over a wide section with an endless-chain easy-work-at-home scheme that brought to the operators, at one time, it is said, $5,000 a day or more. Advertisements asking for girls to do steady work at home, in their leisure, for which they were to be paid $20 a month, appeared in many papers with a rural circulation. Men were barred, and as there are many girls, like the one who recently wrote for advice to THE R. N.-Y., who would like some paid occupation which would not interfere with their home duties, the responses came in great quantities. The applicants were told to buy 60 cherry trees of unstated variety and age for $12. These they could sell their friends at a profit if they wished. Then they would be paid $20 a month, and all they would have to do was to write five letters a day to friends or persons whose names they knew, extending the same offer, and saying the writer was earning $20 a month. This bait attracted many a dollar that represented self-denial or sacrifice. The end soon came, however; the Post Office Department decided that the firm was not carrying out its promises, and an indictment was found on the charge of using the mails for fraudulent purposes. Such despicable frauds as these are specially designed to prey upon the inexperienced, whose necessities make the expenditure of every dollar—perhaps every dime—a matter of careful consideration. The Post Office Department is very energetic in exposing them, but it is difficult to give these swindlers all the publicity they deserve. THE R. N.-Y. has investigated many hundreds of these advertisers, and it can only reiterate the advice to send no money to those who promise easy home employment.

*

IN spite of strong protest Speaker Henderson reappointed Hon. J. W. Wadsworth as chairman of the House Committee on Agriculture. THE R. N.-Y. made its fight fairly and openly, and has no regrets to offer. Charles Y. Knight, of the National Dairy Union, who had charge of the dairy interests at Washington, gives this explanation:

> We found great pressure being brought to bear upon Speaker Henderson by the agricutural press and leading farmers of the country to prevent the reappointment of Congressman Wadsworth of New York, chairman of the Agricultural Committee. The speaker was "twixt devil and deep sea." Committee promotions and chairmanships in Congress come largely through length of service, and when a chairman drops out the ranking member, that is, the next oldest in service, takes the place. The next in succession in the Agricultural Committee is Hon. E. S. Henry, of Connecticut, a staunch and tried friend of ours. He assured us that while he himself would gain promotion through the rejection of Wadsworth he could not approve of the demands that the Speaker humillate Wadsworth in that manner. The controversy had assumed a condition where, not Wadsworth, but the Speaker, was bearing the brunt of this criticism and these protests, and as Mr. Henderson was our leader on the Republican side in 1886 and fought hardest for the passage of the original oleomargarine law in the Hatch bill, we concluded that in justice to himself we should carry these protests no further and notified the Speaker that under the circumstances we should acquiesce in the appointment of Mr. Wadsworth.

A good soldier should follow into battle. THE R. N.-Y. did its share in the preliminary skirmish. There never was anything quite like the way our friends have voted with the postage stamp. We opposed this compromise as a matter of principle. Still, we realize that it is a distinct victory for the farmers. It would not have been won had they not responded nobly to the call and made their power felt. Last year the Committee was carried by one doubtful vote, after much urging. This year it stands 12 to 5 against oleo. Let no man believe, however, that Mr. Wadsworth, in spite of the chastening he has received, has taken off the armor of oleo. He is still in a position to delay the bill. Watch him! Keep at him with the postage stamps.

*

BREVITIES.

PLEA OF THE YOUNG EVERGREENS.

We hide the stony mountain side with green,
And grow in beauty where the plain was bare;
We cling to crannies of the walled ravine,
And through faint valleys waft a strengthening air.
We veil the prairies from the heat, while slow
Across their farmsteads breathes our Summer balm,
And shield them when the winds of Winter blow,
And all our aisles and pleasant rooms are calm.
Men drag us from our fragrant winding vales,
They fell us on the mountain slopes, and bare
The prairies unto heat, and freezing gales,
And thinned, the chaparral plains fail unaware.
They tear us from the wall-chinks of the glens,
And hew us on the marsh we helped to drain,
And where our beauty graced, the tawny fens
Shall lapse to weeds and sworded flags again.
Spare us!—oh! spare our youth with verdure crowned—
Our groves return to deserts when we pass;
The coasts which we revived in sands are drowned;
Bare slopes but yield their stones and bitter-grass.
Spare us! we bring you beauty, shelter, wealth,
Oh! waste us not. Oh! keep with guiltless show
The Holy Time; and life, and joy, and health,
Be gifts to you, while winds of Winter blow.
—Eliza Woodworth, in Birds and Nature.

WHAT is the best antidote for the devil? Hard, honest work!

TEN to one you cannot compete with the windmill in turning wind into work.

YES, there are two sides to every question, but is there more than one *right side?*

Do you know of anyone who is raising any of the large foreign chestnuts for his own eating? Are they not like the Kieffer pear—for sale?

WHAT is the best antedote for the devil? Hard, honest ure to understand that they do their best work under the direction of some one else.

FRUIT Inspectors in the State of Washington keep a very close watch over trees imported from other States, and where infected with disease or insects the whole lot is destroyed. It is felt that the development of the State depends largely upon the fruit industry, which must be encouraged in every way.

The lady who wrote the article on page 835 about centralized schools means business. She now writes: "I know of no other way to prove my statements than for some one who is in favor of the school to come and ride around in those wagons with kids a week or two. I will board him free of charge!" Come, now, ye centralized gentlemen, here's your chance!

IT is against the law to kill an eagle in New York State—no matter how many of your chickens he may destroy. Your claim for damages will rest against the State of New York—which in protecting the eagle assumes responsibility for his mischief.

Events of the Week

DOMESTIC.—Prominent cattlemen of Choctaw Nation will be ejected from the Indian domain, being regarded as intruders by the Choctaw tribal government. It is claimed that the Indians have the backing of the Interior Department. Many cattlemen who own a thousand head of cattle have been served with ejectment notices. This order has created consternation among cattlemen. The step is being taken for the purpose of alloting grazing lands, which cannot be done, it is said, because cattlemen have heretofore refused to vacate lands. . . . . Andrew Carnegie's gift of $10,000,000 to the nation, to be used to promote higher education, must be made in cash or the President may not advise Congress to accept it. It is said that President Roosevelt has already written to the ironmaster to this effect, for the reason that he does not wish the Government made the trustee of a fund consisting of "Steel Trust" bonds. Had Mr. Carnegie offered to give $10,000,000 in cash it is unlikely that there would have been any objection to the acceptance of the gift in behalf of the nation, but a number of members of Congress are known to have serious objection to the character of the gift as it is offered, feeling that it would be inadvisable for the Government to undertake such a trust. . . . . The finding of the Schley Court of Inquiry was made public December 13. Two reports were submitted, the court agreeing upon the facts, but not upon the opinions based thereon. The majority, Admirals Benham and Ramsay, condemn Admiral Schley for various acts of omission, and find that his conduct was "characterized by vacillation, dilatoriness and lack of enterprise." They say however, that in the battle he was "self-possessed, and he encouraged in his own person his subordinate officers and men." Admiral Dewey made a separate report sustaining Admiral Schley and giving him credit as the officer in command for "the glorious victory which resulted in the total destruction of the Spanish ships." The court agreed in recommending that no further proceedings be taken. . . . . The heaviest bail bond ever demanded in a criminal case was exacted by Judge Aspinall, of New York, December 13, in the case of William F. Miller, head of the 520 per cent Franklin syndicate. Miller, who was sentenced to a term of imprisonment at Sing Sing, recently obtained an order for a new trial, and was brought before Judge Aspinall on a motion for release on bail. The bond was fixed at $72,500. . . . . A terrific rain storm extended over Pennsylvania, New York, and adjacent coast States December 14. The havoc in the Pennsylvania coal region will reach millions of dollars; mines are flooded, and railroad property destroyed. It will be weeks before some of the mines can be operated again; 48 mines were flooded in the Schuylkill Valley, and hundreds of mules drowned. The Schuylkill, Juniata, Lehigh and Susquehanna Rivers rose 15 feet. At Syracuse, N. Y., a sudden rise in Onondaga Creek drove 500 families from their homes, and caused damage amounting to $250,000. At Canastota farmers will lose heavily from the flooding of celery fields. A phenomenal rise of the Mohawk River has caused great distress in the vicinity of Utica. At Ithaca the flood was the most disastrous since 1857; loss about $500,000. Some loss of life occurred in several localities. . . . . A railroad collision at Perryville, Ill., December 15, caused the death of eight persons. . . . . At Essex, Mont., a train was derailed December 15; eight persons killed and 16 injured. . . . . The business portion of Salem, W. Va., was destroyed by fire December 15; loss $200,000.

CONGRESS.—The Senate Committee on Interoceanic Canals has decided to pay no attention to the claims of the Maritime Canal Company, of Nicaragua, which claims to have purchased the route surveyed and recommended by the Canal Commission, and which insists that all franchises and concessions have been conveyed to it by the Nicaraguan Government in consideration of a large sum of money. The decision of the committee was reached upon the recommendation of Secretary Hay, who informed Mr. Morgan that the Government of Nicaragua had admitted the sale of lands to the company, and granting franchises and concessions, but that the sale had been annulled and the franchises revoked since it was made public that the Nicaragua route had been selected. Secretary Hay has decided not to consider the claims of the company, but to regard the action of Nicaragua as official and final. The effect of this action on the part of the State Department leaves the Maritime Company without power to obstruct canal legislation during the present Congress. The change of front by Nicaragua, however strange it may be regarded, is not likely to bring about further complications and thus delay legislation for the beginning of construction. . . . . The anxiety of the Pacific coast over the extension of the Chinese Exclusion act seems to be justified by the complications that are appearing in the matter from day to day. The fact that it is seriously proposed to extend the Exclusion act for but two years, and that Senator Proctor has introduced a bill to this effect, is now giving the advocates of complete exclusion no small amount of annoyance. The Proctor bill is based on the argument that the treaty that was negotiated with China in 1894 has but two years to run, and that it would be bad policy to pass a 10 years' Exclusion law now, when in a short time we shall want to make another treaty with the Yellow Empire. This phase of the situation is also colored by the aim of the Administration to continue as far as possible the policy of McKinley in regard to the "Open Door." The Chinese Government has already protested against the exclusion of their merchants and artisans from the Philippines, and the argument is made that the United States should not expect China to grant us any special trade advantages if we propose to keep her people out of the Philippines, where they are a thrifty and rich element. Minister Wu has already laid before the State Department the objection of the Chinese Government to the attitude of the United States in regard to the free admission of the Chinese in the Philippines, and the correspondence has been sent to Congress.

FARM AND GARDEN.—Among exhibitors who received gold medals for displays of seeds at the Pan-American Exposition are Frank H. Battles, Rochester, N. Y.; J. J. Bell, Deposit, N. Y.; Briggs Bros., Rochester, N. Y.; Crossman Bros., Rochester, N. Y.; Cleveland Seed Co., Cape Vincent, N. Y.; Henry A. Dreer, Philadelphia; The Albert Dickinson Co., Chicago; F. H. Ebling, Syracuse, N. Y.; Harvey Seed Co., Buffalo; Jerome B. Rice Co., Cambridge, N. Y.; J. M. Thorburn & Co., New York City; James Vick's Sons, Rochester, N. Y.; State of Wisconsin; Whitney-Eckstein Seed Co., Buffalo; Massachusetts Agricultural College, Amherst, Mass., agricultural and botanical collection. Minister of Agriculture, Buenos Ayres, collective exhibit of seeds. T. Howard, Canada, location not given, white and black oats.

Cattle show week began in London, England, December 9. The idea of a Christmas exhibition of cattle was started by the Smithfield Club, in 1798, and the show which was opened by the King at Agricultural Hall, Islington, December 9, is the 103d of its kind. The King has been a frequent prize winner at Agricultural Hall, and this year he again contributes extensively to the cattle and sheep divisions. The prizes offered amount in value to nearly $18,000, or about $1,500 less than the average.

The nineteenth annual convention of the American Forestry Association began at Washington, D. C., December 11. Secretary Wilson made the opening address, referring to the increase in the movement for forestry preservation. Dr. B. E. Fernow, of the New York State College of Forestry, presided. Committee reports were discussed, favoring setting aside 500,000 acres of public land for forestry in Nebraska, the creation of the National Appalachian Park, for forest reserve, and consolidation of all Government forestry work under the Department of Agriculture.

The thirtieth annual meeting of the Kansas State Grange began at Topeka December 10. Thirty-six accredited delegates were present. The largest delegation was from Johnson County, where the order maintains coöperative stores, which did a business of $240,000 in 1900. The main store of the Johnson County association is at Olathe, and branch stores are at Stanley, Gardner, Edgerton and Prairie Center. This association has been in successful coöperation since 1876. It is governed by rules laid down by the National Grange. The stock is held by members of the order. The capital of the concern was originally $20,000. It is now $100,000. Other coöperative associations are maintained by the order in Miami, Osage and Linn Counties, but they are not as strong as the Johnson County enterprise. In 1900 the State Grange numbered 2,324 members, included in 44 subordinate Granges.

The Colorado State Grange will meet at Denver January 14-16, 1902; secretary, J. A. Newcomb, Golden, Col.

The Connecticut State Dairymen's Association will meet at Hartford January 22-23, 1902; secretary, George E. Manchester, Winsted, Conn.

The Connecticut State Grange will meet at Hartford January 14-16, 1902; secretary, H. F. Potter, North Haven, Conn.

The Illinois State Dairymen's Association will meet at Freeport January 7-9; secretary, George Caven, 154 Lake street, Chicago, Ill.

The Indiana State Dairymen's Association met at Plainfield, Ind., December 18-19.

Among the approaching conventions at Lincoln, Neb., are the State Dairymen's Association, January 22-24; the State Horticultural Society, January 7; the State Board of Agriculture, January 20-25; State Farmers' Institutes, January 20-25, and State Sugar Beet Growers' Association, January 20-25.

The New Jersey State Horticultural Society will meet at Trenton January 8-9; secretary, H. J. Budd, Mt. Holly, N. J.

The New York State Fruit Growers' Association will meet at Syracuse January 8-9; secretary F. E. Dawley, Fayetteville, N. Y.

The American Cranberry Growers' Association will meet in Philadelphia January 28.

At the annual meeting of the Indiana State Horticultural Society the following officers were elected: President, W. W. Stevens, Salem; first vice-president, E. B. Davis, Cartersburg; second vice-president, E. M. C. Hobbs, Salem; third vice-president, E. C. Reed, Vincennes; fourth vice-president, J. C. Grossman, Walcottville; secretary, W. B. Flick, Lawrence; treasurer, Sylvester Johnson, Irvington; executive committee, Prof. James Troop, Purdue University, J. A. Burton, Orleans, and H. H. Swain, South Bend. Next year's meeting will take place at the State House, Indianapolis, the first Wednesday after the first Monday in December. During the Summer the State Horticultural Society will meet with the Johnson County Horticultural Society.

Under rules laid down by the new Yale School of Forestry and the Connecticut State Agricultural Experiment Station in New Haven, a large State park is being provided for. The purchase is in the hands of Walter Mulford, who has been appointed State Forester under the provisions of the law passed a year ago, which provide for a permanent study of forestry and a State park.

The twenty-ninth session of the Pennsylvania State Grange began at Johnstown December 10, when Master W. F. Hill addressed nearly 1,000 delegates. In the evening there was a public meeting, at which Mayor Woodruff and J. J. Thomas welcomed the Grangers, William T. Creasy responding. An address on "Forestry," by Attorney C. C. Greer, was well received, and Attorney T. J. Itell, discussing "The Law of Progress," disclosed radical thought along economical lines. Master Hill's address was an exhaustive treatment of the agricultural situation. In 1850, he said, there was $8,500,000,000 of wealth in the United States, and farmers had $5,000,000,000 of it. In 1890 the country's wealth had increased to $64,000,000,000, but the farmers had but $16,000,000,000 of it, although 75 per cent of all wealth annually produced was produced by the farmers. In other words, farmers possessed 60 per cent of the wealth of this country in 1850. During the next 40 years they produced more wealth than all other interests combined, but other interests had absorbed three-fourths of it, and the farmer finds himself the owner of but one-fourth of it. "Is it not our right, then," he asked, "to insist that we shall have a fair share of the profit our own harvests yield? Should it not be our aim to handle these products from sowing to marketing in a skillful and businesslike manner?" Mr. Hill opposes the Ship Subsidy bill, favors radical reform in State taxation, advocates free rural mail delivery, election of United States Senator by direct vote of the people, anti-trust laws, the revision of the fees and salaries of State and Federal officers, and the protection of dairy interests by the passage of House bill No. 3717. He thought the killing of birds for sport, causing an alarming increase of insects, beetles and worms, should attract the attention of legislators.

Too Much for the Miller.

The farmers in this section have to go some distance to get their wheat ground, and the millers take about one-half to one-third for grinding, and the flour is no better than we used to get 40 years ago. I would ask whether the millers have a right to do that, or are the farmers obliged to let them grind our wheat to halves? It comes pretty tough on the farmer who raises his wheat on shares, and then lets the miller take half of that for grinding. Is that the way they do all over the country? If so we would better stop raising wheat. I would like to hear from other farmers on this question.

Chautauqua Co., N. Y. J. H. A.

R. N.-Y.—We wish to hear from other farmers about this. What is the toll in *your* neighborhood? The average share for the miller is about 10 per cent. Few farmers take the trouble to weigh before and after grinding. The best plan is to agree upon a price for grinding 100 pounds of grain and take it all home.

"Red Albumen" for Hens.

Every now and then the gullible farmer is fooled, and the agricultural press is loud in advising him to subscribe for some paper to protect him. But the gullible editor also bites at baits himself. The notorious J. M. Bain would, several times a year, secure a column of free advertising in the guise of an innocent-looking communication. Now comes the "red albumen" man, who mentions the wonderful advantages of "red" albumen as an egg food. He gives no name, but you can get it at the drug store. Of course the druggist, in the face of inquiries, orders from the wholesalers, and the red albumen man in the background gets rich without paying a cent for his advertising, while the editor sits down and warns his readers against "gold bricks," etc. Four different "red" albumen communications came to me, intended for as many different papers, the article "going the rounds" of the press, and probably every newspaper and agricultural journal received one. Samples of red albumen showed it to be ground meat and bone, and perhaps a little blood. The odor alone will expose it. It is worth, wholesale, about two or three cents a pound, and need not be bought from a druggist. There is no such thing as "red" albumen, unless materials containing albumen may be so regarded, such as blood, nor has pure albumen any odor. I am not finding fault with the "red" albumen man. He simply "worked" the agricultural press and did it well. The fools (editors) are not all dead yet. In justice to some editors, however, I will state that they rejected the bait. P. H. JACOBS.

Hammonton, N. J.

R. N.-Y.—We have received dozens of copies of the printed letter from the "red" albumen man. In every case thus far these clippings were taken from city papers. We do not think that any reputable agricultural paper paid any attention to it; but the daily and weekly city papers jumped at the bait. Wholesale druggists in this city tell us that there has been a great demand for "red" albumen. At first they looked upon it as a joke, but orders poured in from the country until the price advanced. In some cases they furnished a substance used for dyeing! The trick was well worked, but few agricultural papers were caught by it. The city papers did the damage in this case!

CALIFORNIA NOTES.—The farmers in this vicinity are well along with their work; crops secured, and much of the land being put in cultivation for another crop. This year main crop was Lima beans; next perhaps comes the English walnut. Both have been fair crops and are selling at good prices. Hay plenty at about $10 per ton. Lemons have done well and the harvest lasts most the year. Prices have not been sufficient to please all. Oranges are ripening and promise well. They are not extensively grown here, so there are not enough yet fully to supply the home market. Apples are a rather short crop, pears not over plenty, particularly on old trees. Olives are a large crop, but prices low delivered at the oil mills. Some will be pickled but that will be but a small part of the crop. Oil makers do not like to pay over two cents per pound so there will not be a large margin left after the cost of picking and the freight bills are paid. Cost of picking one-half to one cent per pound—when the work is hired done. Potatoes a light crop and well up in price. Onions scarce and high. Prices for grain are lower than farmers like to work for, and few others will work for such small pay. Weather nice and warm. We have had rain enough to start the grass but more is needed to keep the land in order for the plow and keep up growing crops. O. N. C.

Santa Barbara Co., Cal.

THE COST OF CORN.—As to the exact cost of raising corn on level prairie land, it differs, as you well know, with the cost of living. Day labor costs (except in haying or harvesting) $1, but as I hire by the month at $20, and that generally the highest for common hands, I have charged 67 cents a day as the cost to me. If I hire horses I am charged 50 cents a day, and that is the price in the following figures. We generally expect a hand with a 16-inch plow and three horses to plow thoroughly three acres a day, and what I mean by thoroughly is to stir all the ground. I have seen more ground gone over, but I could not call it plowed as I would want it. Three horses and man one day, $2.17, which would make one acre cost 72 1-3 cents. When harrowing with three horses and lapping well we call 20 acres a day's work; therefore, at the same price for day's labor an acre of harrowing once is 10 1-3 cents, and we generally give four harrowings. If we put on four horses 24 acres is considered right, and that costs 11⅓ cents an acre. In planting corn with a single team eight acres is considered an average day's work, and at the above figures would make it cost 20⅞ cents an acre. In cultivating seven acres a day on an average, costing 23 6-7 cents an acre, and as we always give three stirrings, and if possible four if the corn does not grow too fast, it makes it either 71 4-7 cents or 95 3-7 cents, according to the number of stirrings. Husking costs generally $1 a day for hand, or 2½ cents a bushel, when boarding the hand. Some hands husk from 50 to 70 bushels a day. There are some who can do more, but they are above the general rule of workers. This year our corn will cost us nearly $1.50 an acre. It would be right to add the interest of what all the tools cost, and the damage accruing to the use of same to get the exact cost. R. C. S.

Campbell, Iowa.

Woman and Home

From Day to Day.

PA'S AWFUL IGNORANCE.

Most every day when I'm at school
The teacher tells us things
About the birds and animals
And presidents and kings,
And then, at night, when I ast pa
If what she says is so,
He reads his paper right along
And says: "Oh, I dunno!"

One day she told us that the world
Is round, just like a ball,
And that there's nothing down below
It's standin' on at all.
I ast pa if she told the truth,
He read his paper, though,
And put his feet up on a chair,
And said: "Oh, I dunno!"

And onee the teacher said the sky
Ain't heaven's floor, and tried
To make us think no angels walk
Along the other side.
And so that night I ast my pa,
And all he said was: "Oh,
Don't bother me about sueh things,
I'm busy—I dunno!"

One time a bigger boy he said
The doctor didn't bring
My little baby sister in
A box—no sueh thing!
That night I ast my pa if what
That big boy said was so,
And pa he answered: "Oh, keep still—
Confound it, I dunno!"

I used to kind of think somehow
That my pa knew a lot—
But that was wrong, or if he did
I guess that he's forgot.
Since I've got started into school,
Most every day or so
I hear about a hundred things
Pa doesn't seem to know.

—Chicago Record-Herald.

*

A WRITER in the London Hospital says that "for strangers to kiss a baby is a piece of abominable impertinence." Careful mothers will agree with this, though they may not accept the further assertion that this salutation is "an unforgivable sanitary sin."

*

VEGETABLE parchment paper is now prepared especially for household use. It toughens when wet, and is airtight; hence is very useful to wrap up meat or fish. It does not tear like ordinary paper, and is excellent to use in the bottom of cake tins when baking. The manufacturers highly recommend the use of parchment paper as a dishcloth; it is tough enough for the purpose, and may be burned after using.

*

IN cooking cranberries, which are always a Winter relish, the sugar should never be added until the berries crack open; if sweetened before this the fruit is tough and hard. Of course this fruit must always be cooked in agate, porcelain or stoneware; it is too acid for contact with metal. A nice way to serve cranberry jelly is to mold in glasses, then turn out and cut in slices like bread. A round slice of the ruby jelly, with a little heap of whipped cream upon it, makes a very pretty dessert.

*

A MERE man suggests that the shapeless raglans that are so popular for women's wear offer an inviting field for inexperienced amateur seamstresses. If a raglan appears to fit it isn't a fit, according to fashion's requirements; the more "slack" there is at the waist and the more dip at the hem the better. The raglan is certainly a leveling and democratic garment; in it all women appear upon an equal level of unshapeliness. It rages with great violence everywhere, but has become so common that it will soon lose favor, and by another season will be advised only in its proper place; that of a useful extra wrap to wear in stormy weather, or to cover a gown that needs protection. It is, properly, a driving rather than a walking coat. One of the humors of the season is to see a woman trailing through the city streets with a raglan which rests an inch or two on the ground all round, striving at the same time to hold up a long-tailed frock which, with the innate depravity of such garments, insists on dipping down in a series of scallops. There are some fashions that cause one to endorse, temporarily at least, the opinion of those ancient theologians who argued that woman is not to be regarded as a reasoning being.

*

A READER asks what the cold cream used as an emollient for chapped and roughened skin is made from. Its proper constituents are oil of sweet almonds, white wax, spermaceti and rose water, but many of the cheap and highly perfumed creams sold contain less innocent ingredients. Our formula is: White wax and spermaceti, of each one ounce; oil of sweet almonds, five ounces; rose water, 1½ ounce, in which a pinch of borax (20 grains) is dissolved. Shave up the wax and spermaceti and with the oil, put in a little porcelain kettle over a slow heat. (Our mixing vessel is a Dundee mamalade pot, put towards the back of the stove.) When melted together remove from the stove and stir in the rose water, which may be warmed by standing the bottle in a pan of hot water. Stir thoroughly together; some say beat together with an egg beater, but we have never done this. If further perfume is desired, add before it thickens. This is not troublesome to make; is cheaper than the readymade article, and one has confidence in its ingredients.

*

ANY mother who thinks that the average boy has a cavernous appetite should study the housewifely exertions of a small bird with a nest full of hungry nurslings. A naturalist who watched a wren's nest last Summer states that Mrs. Wren made 110 trips to her nest during four hours and a half, and this was the bill of fare devoured by her three children: Twenty green caterpillars, 16 May flies, 29 unidentified insects, 11 worms, two bugs, 10 grasshoppers, seven spiders, and a chrysalis or two. We have often heard a wren of our acquaintance, who nested near the house year after year, scolding her husband severely at bedtime; no doubt she was telling him that she was just tired to death, after being on her wings all day looking after the children!

A CANADIAN DISH CLOSET. FIG. 394.
Second Prize in Photographic Competition.

A Handy Dish Closet.

SECOND-PRIZE PICTURE IN THE PHOTOGRAPHIC COMPETITION.

The accompanying picture illustrates a dish closet built over an opening, left in the wall between kitchen and dining-room. It is built on the dining-room side. The door on the kitchen side does not extend down to the floor, only to the lower shelf. The drawers are a handy place in which to keep table linen, towels, etc. MRS. HUGH AITON.

Best Squash and Pumpkins for Pies.

What varieties of squash and pumpkin are best for pie-making? Which have the richest and driest flesh? READER.

The little sugar pumpkin and the Hubbard squash are the best for pies. I asked one woman what squash she liked best, and she said "these little sugar pumpkins." When pressed further she said if she had to use squash she preferred Hubbard. Two others that I asked declared in favor of the Hubbard. A good squash should be so hard-shelled that it has to be chopped open with an ax or else dropped on the stone doorstep. Then scoop out the seeds and steam the pieces, shells, squash and all, and when tender, dry a little in the oven and then scrape out the flesh. S. B. R.

Ruggle's Christmas Tree.

Randolph P. Ruggle was a remarkable man—a very remarkable man. Everything considered, I believe he was the most remarkable man I ever knew. He was a New Englander, born in Connecticut, and was of the best Puritan stock. He was always proud of the fact that most of his male ancestors had been clergymen, or at least teachers. At the time of which I am speaking he was middle-aged, or somewhat past, tall, thin, long-whiskered and with a wonderfully magnetic eye. He was, in fact, something of a mystic in feeling, but strictly practical in his actions and fully conversant with the ways of the world. He was resourceful, full of energy and never lacking the courage of his convictions; all of which made him a leader of men.

It was early in the year '48, or it may have been '49 or '50—the exact date doesn't matter—that Ruggle formed a colony to go to California. I was among the first to join. There were some 60 or 70 families, making, counting the children, over 200 souls. We arrived early in the Spring, in time to plant our crops, which Ruggle did not fail to see included plenty of beans, pumpkins and other New England luxuries. He had a strong love for everything pertaining to the region of his birth, and his dream was to build up a community which should be a slice cut out of the Connecticut River Valley. Tobacco culture, however, he barred, as well as the manufacture of New England rum. But he brought along a quantity of turkey eggs, mindful of the Thanksgiving season, and these he set under blue jays, one egg to each jay. Strange as it may seem, he had very good luck with this rather odd form of incubation, since he seemed to have the same mysterious influence over the brute creatures that he had over men.

The efforts of Randolph P. Ruggle to establish a little New England were pretty successful, not withstanding that we were in a perfect wilderness and with no communication with the outside world. Our colony included a Congregational minister named Snow, and one of the first buildings erected was a church—meeting house Ruggle preferred to call it. This we used also for a school room on week-days, the oldest Ruggle girl assuming the position of school ma'am. Ruggle established town meetings, and we met and elected road overseers, though there were no roads, and a justice of the peace, though there wasn't any crime, and selectmen, though they had precious little to do. In fact, about the only thing we missed was the New England weather, or, rather, weather served in the New England style, samples of all the different kinds in one day; and sometimes we thought Ruggle was thinking about introducing that, as he spent a good deal of time gazing at the sky. But if this was his idea nothing came of it, and we had to get along with the regular native climate.

Thanksgiving Day was a great event with us, and we couldn't have seen it through in better shape if we'd been living at East Upper Puddleford Center, Conn. Early morning services in the church, and later pie of all kinds, not and cold, with and without upper crusts, and those blue-jay turkeys. It ran on till shortly before Christmas, when we noticed that Ruggle was getting very much worried over something. We thought it was about his wife's Christmas present. He set great store by his wife, and they were a most devoted couple—used to wander about hand in hand, presenting an impressive sight, he measuring about six feet four and she being somewhere in the neighborhood of the four-foot-six class. You see, he had always made it a practice to give her a Christmas present which nobody else ever got, and it rather stumped him to come at such a gift out there in the wilderness. He was about this just as he was about everything else—bound to be original. Once he'd given her a new sidewalk in front of the house, and another time he cut down a tree and gave her a view she wanted, and on still another occasion he had cleaned out the kitchen chimney and called the improved draft her Christmas present. But this time he couldn't seem to hit on anything, though we soon saw that this wasn't all that was worrying him. At last we found out that he had got his heart set on having a Christmas tree—about the most absurd notion that he could have got into his head. But that's the way he was—the greater the difficulties the more determined it made him.

You might think, of course, that, situated as we were, a Christmas tree would have been right in our line and easier than hanging up our stockings, but you would be wrong. Every tree within reach was in the neighborhood of 400 feet high and from 75 to 100 in circumference. Any man in the world except Randolph P. Ruggle would have seen the hopelessness of the thing. But he just kept the outer corner of one eye cocked up at those ridiculous redwoods and went on thinking. Most self-sufficient man I ever knew, Randolph P. Ruggle was.

One day, a week before Christmas, Ruggle happened to meet me near his house, and says he:

"Well, we're going to have a Christmas tree—that's one thing settled and off my mind."

"But, Mr. Ruggle," I answered, "I can't see how it's possible. The trees around here average 350 feet high and ——"

"Never mind their average," he broke in. "We aren't going to use the whole grove. I've found one over a quarter of a mile from here which is no size at all—a mere bush."

"How high is it?"

"Oh, not over 265 feet—just a dwarf. Perhaps 15 feet in diameter at the base."

"But the church isn't over 18 feet to the ridgepole. I don't see how we can get in even such a little sprig as that," I returned—pretty sarcastic, I'm afraid.

"I've been guessing myself that it would stretch the edifice somewhat," he answered, just as cool as when he first spoke. "Do you happen to know of any law against a Christmas tree sticking up a little mite through the roof?"

"No," I replied.

"That's what ours is going to do."

"But it seems to me that the job of moving this shrub that you're talking about is going to be something of a staggerer."

"I didn't say that we were going to move it. Did you ever hear of Mohammed and the mountain?"

"Yes."

"Precisely. Mohammed was all right in many ways, if he was a foreigner. We shall move that church over to the tree, take off the rear end, cut a 15-foot scallop in the floor and roof, back it up around the tree and then clap on the end; and there you are. I don't see what more any reasonable person could want. We're in a new country and we've got to make the best of things. It won't stick up but 247 feet, anyhow."

Well, of course when Randolph P. Ruggle made up his mind to a thing that settled it, and in three days everything was arranged as he had planned. "There!" said Randolph P. Ruggle; "there you are. The children won't have to go without their Christmas tree. Only a little over 150 feet to the first branches and plenty of room for the presents. A man can put on a house and lot or an ocean steamer if he wants to. No crowding of the wax candles and setting thing afire. Beats one of those little house trees all hollow. Everything shut off from the view of the audience and the element of surprise introduced."

But Ruggle couldn't get over his inability to think of something to give his wife. When people began to fetch things to put on the tree the last afternoon it brought this to his mind more than ever. "She'll be expecting something, and she'll be the only person who won't get anything," he said. "But I'll let her go without before I'll give her some commonplace gimcrack."

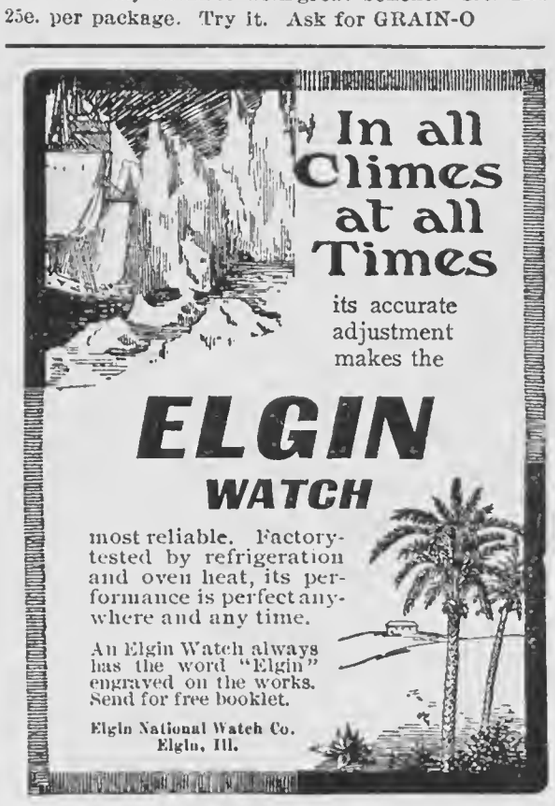
Of course the trimming of the tree and the putting on of the presents fell to Randolph P. Ruggle. We thought he was going to find it difficult to get up, but he didn't. The bark was pretty rough and he went up, like a cat, driving in spikes occasionally where the trunk was too smooth to afford a foothold. Before he started he tied the end of a ball of twine to the tail of his long blue coat, with the brass buttons, which he always wore; and when he reached the top he drew up a rope with the string and hoisted the other things with the rope. Trimmed it all up with festoons of popcorn and red apples, and tinsel, and candles, and it blazed and sparkled like a skyrocket just as it explodes. When it came time for the exercises Randolph P. Ruggle went up in the tree again and let the presents down with his rope, a dozen at a time, and we passed them through the window of the church, where Rev. Mr. Snow distributed them to the congregation with chirpy and good-natured little humorous remarks. When the last present was off Randolph P. Ruggle started to let himself down by tying one end of the rope around his body under his arms and then throwing the rope over a branch, taking it in both hands and paying it out as he descended. But he had miscalculated its length and he reached the other end while still 30 feet from the ground. Here he remained suspended, and the prospect looked pretty dark for Randolph P. Ruggle, as he wasn't able to pull himself back up. But finally we reached up with a long pole which had a hook on the end of it, and, getting the hook through the back of his blue coat, began lowering him. Somebody called out: "Pass him through the window for his wife's Christmas present," and this we did, Mr. Snow making appropriate remarks as we laid Randolph P. Ruggle down in front of the lady.

A very remarkable man was Randolph P. Ruggle—very remarkable—and I shall never see a Christmas tree or a blue jay either, for that matter, without thinking of him.—Harper's Magazine.

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

THERE IS A CLASS OF PEOPLE

Who are injured by the use of coffee. Recently there has been placed in all the grocery stores a new preparation called GRAIN-O, made of pure grains, that takes the place of coffee. The most delicate stomach receives it without distress, and but few can tell it from coffee. It does not cost over ¼ as much. Children may drink it with great benefit. 15c. and 25c. per package. Try it. Ask for GRAIN-O

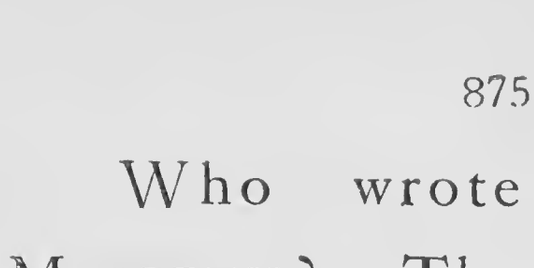


Who wrote MACBETH? The wise woman who got into some lamp trouble or other.

My name on every one.

If you'll send your address, I'll send you the Index to Lamps and their Chimneys, to tell you what number to get for your lamp.

MACBETH, Pittsburgh.



WELL DRILLING Machines

Over 70 sizes and styles, for drilling either deep or shallow wells in any kind of soil or rock. Mounted on wheels or on sills. With engines or horse powers. Strong, simple and durable. Any mechanic can operate them easily. Send for catalog.
WILLIAMS BROS., Ithaca, N. Y.

SPECIAL OFFER

High-Grade Watches.
WALTHAM AND ELGIN ONLY.

Orders will be filled by return mail for Christmas and New Year's presents.

We now offer some extra fine watches. Every watch offered is stem wind and set and has all improvements.

The "P. S. Bartlett" Waltham and the "G. M. Wheeler" Elgin are as good watch works for men as we have ever seen.

Men's Size Watches.
"P. S. BARTLETT" OR "G. M. WHEELER."

We give you your choice. They are full 17-jeweled watches. They are adjusted by experts and are first-class in every respect. They come cased at following prices, including free safe delivery:

In solid ore-silver case, open face	$12.25
In sterling silver case, open face	13.88
In sterling silver case, 3 oz. case, open face or hunting	16.15
In 25-year gold filled case, open face	18.56
In 25-year gold filled case, hunting	21.37

No. 7. Ladies' Waltham or Elgin Watch.

Can You

do a little pleasant and profitable work for us in your own town? No experience necessary. We will explain just what you have to do. The work will be light, and we will arrange for the time you shall be able to give to it. We can give you work for all your time or just for your spare time. Write for full particulars. THE RURAL NEW-YORKER, NEW YORK.

BUSINESS BITS.

WE are in receipt of the Sure Hatch Incubator Company's fifth annual catalogue. It is a book of 166 pages, over 200 illustrations, and contains a vast amount of poultry information, plans for poultry houses, yards, etc., chapters on practical poultry-raising, and how to make money on a small investment, etc.

THIS is the year for farmers to grind corn and cobs for feeding purposes. It has been quite clearly demonstrated at a number of the experiment stations that 70 pounds of corn and cob meal has, when fed to hogs, about the same feeding value as 70 pounds of pure cornmeal. Experiments are not so conclusive when fed to cattle, but many practical farmers have found in the past, even when corn was cheap, that cattle fed on corn and cob meal, with little or no other roughness, made remarkable gains. Whether it pays to grind corn and cob meal even under this showing depends largely on the price of corn. This year corn is high, and farmers cannot afford to pay toll. Get a good grinder and do your neighbors' grinding also.

AN ice crop has become just about as much of a necessity to the modern farmer and dairyman as his hay or grain crops. But how many invest in suitable ice tools? When the ice is just right it should be harvested in a hurry, and then is the advantage of having at hand a first-class plow, such as the Ice King, made by Wm. F. Wood & Co., Arlington, Mass. Catalogue, "How to Harvest Ice," free.

B. H. GREIDER, the well-known poultryman, of Florin, Pa., is breeding 50 varieties of poultry to a very high standard of excellence. Mr. Greider's catalogue for the year 1902 is now ready for distribution. It is illustrated in colors and describes all of his varieties of prize-winning poultry, and gives a great deal of interesting and valuable information on poultry topics. It is worth a great deal more than the 10 cents in silver or stamps asked for it. Address B. H. Greider, Florin, Pa.

IN regard to the peach orchard of the Vermont man, page 660, the one which does not bear, let me suggest that he treats it too well. Let him try it in sod for awhile. At our town fair, this Fall, fine peaches were exhibited, grown on one of the hills here. We are much farther north than he, and I think the tree or trees are not cultivated. G. S PAINE.

Maine.

Never let a little child's cold "run on." There is sure danger and perhaps death at the end of it. The infantile organs are always helped by Dr. D. Jayne's Expectorant, and the little ones like it.—*Adv.*

GLENN RANCH,

Glenn County, California,

FOR SALE IN SUBDIVISIONS.

This famous and well-known farm, the home of the late Dr. Glenn, "the wheat king," has been surveyed and subdivided. It is offered for sale in any sized government subdivision at remarkably low prices, and in no case, it is believed, exceeding what it is assessed for County and State taxation purposes.

This great ranch of 40,000 acres runs up and down the western bank of the Sacramento River for 15 miles. It is located in a region that has never lacked an ample rainfall, and no irrigation is required.

The river is navigable at all seasons of the year, and freight and trading boats make regular trips.

The closest personal inspection of the land by proposed purchasers is invited. Parties desiring to look at the land should go to Chico, California.

For further particulars and for maps, showing the subdivisions and prices per acre, address personally or by letter,

F. C. LUSK,

Agent of N. D. Rideout, Administrator of the Estate of H. J. Glenn, of Chico, Butte County, California.

For Sale Cheap.

A "New Era" Gasoline Engine, 14 Horse Power.
1,000 feet 2½-inch Iron Pipe.
One Rotary Force Pump; capacity 300 gals. per min.
Check Valves, Shut-Offs, etc.
WALTER F. TABER, Lakeview Farm, Poughkeepsie, N. Y.

Free Public Lands.

Free Homesteads, Free Timber Lands, Free Grazing Lands, Free Mineral Lands, Free Stone & Coal Lands — Located by Counties, and giving fullest information about free government lands and how to secure them.

100 pages packed full of information to Land Seekers.
A BILLION ACRES OPEN TO FREE ENTRY.

VACANT GOVERNMENT LANDS is the title of a new book just published giving the number of acres and the kind of land described that is open to settlement in each county of every public land State and Territory. The location of each land office to which applications are to be made, with blank form of application. It tells about irrigation and irrigated lands. About oil and saline lands. How to acquire townsites and millsites. With many diagrams and tables revised up to date. This book will be mailed to any address with six months' subscription to THE FARMER, St. Paul, Minn. The oldest and leading farm paper in the State, all for 25 cents.
Address, WEBB PUBLISHING CO., Publishers, 53 E. 4th, St., St. Paul, Minn.

As We Go to Press.

"A MERRY CHRISTMAS."

Once more the cycle of time has brought us to the greatest festive season in the calendar of the year. It is a time when every Christian heart is filled with new hope for himself and an ardent inspiration of charity and good wishes towards his fellow men. At the Yuletide above all other times we feel a spirit of benevolence. No matter how neglectful we may be of our kin or neighbor at other seasons of the year, at Christmas every one wishes to do something to make another human being happy. This yearning of the heart need not go unsatisfied because of want of means to express one's full feelings, since it is in the sentiment rather than in the means used to express it that we find the real source of happiness. A kind word, a letter to a distant friend, or any little token of remembrance may be more appreciated by some heart yearning for sympathy than the most costly gift to those who are already satiated with material comforts. Perhaps there is some one estranged from the family circle waiting in the shadow of his own mistaken pride for the kindly word to restore him or her to the full light and warmth of your affection and love. No one should hesitate to make the advance lest he should meet with an unkind repulse or for a just sense of wrong to himself. The effort will at least serve to bring under control and subjection the less desirable element of our own nature, and such a victory over self affords far greater satisfaction than can result from any other triumph.

Then, too, kindly acts, like all other human efforts, become easier of performance as we repeat them. As we feed the hungry, clothe the naked or relieve any distress we come closer to the objects of our charity or benevolence and feel a kindlier sympathy for them. So, too, in our daily service, whether performed in line of duty for a little child or for those by nature depending on us for support, or in the intercourse of business for mutual good, the effort to be of service to another—even for a reward—when pursued with an honest purpose inspires a feeling of interest almost akin to affection for those whom we try to serve, even though their faces and voices may not be familiar to us.

It is something of this feeling of interest and sympathy that we develop during the year in our constant efforts to be of service to our patrons and subscribers, and it is the reciprocation of this sympathy and interest we read with pleasure and satisfaction as our daily mails from you bring us encouragement and cheer in both word and kindly offices. In kindly appreciation of this mutual interest, with this the last message of the old year, we send our greeting to all members of THE R. N.-Y. family. We hope that cheer and happiness may abide in every home at this festive time, and that peace and prosperity may attend you from the beginning to the end of the new year.

BOOK BULLETIN

FOR SALE BY THE RURAL NEW-YORKER.

PRIZE GARDENING.—This compact volume of 322 pages gives a record of the experience of a number of practical gardeners who participated in a prize garden contest. The knowledge thus summarized extends over a wide range of country, and the contestants include all classes, from small amateurs to professional market gardeners. Gardening by men, women, boys and girls; farm gardens, town and city gardens—all are here described. The result is a mass of personal experience that could be obtained in no other way. There are numerous illustrations. Price, postpaid, $1.

THE GARDEN OF A COMMUTER'S WIFE.—This bright and entertaining book tells of a woman's country life and gardening experiences. It is very pleasant reading, and while it will appeal especially to those whose tastes are for rural pleasures, it will also point the way towards them to others who do not fully realize what a privilege it is to live away from bricks and mortar. There is a wholesome human interest running through the book. It is charmingly bound and illustrated, and would form a very desirable gift book for any flower-loving woman. Published by Macmillan & Co.; will be sent postpaid from this office. Price, $1.50.

THE MOHAWK VALLEY; ITS LEGENDS AND ITS HISTORY.—This book deals with the period between 1609 and 1780. It tells of the French and Indian wars and the Revolutionary period; links legend with history, and gives a vivid picture of the stirring adventures of the pioneers. We read in it of the French Jesuits who penetrated the wilderness as missionaries—in many cases to die for their faith by cruel martyrdom; of the early French and English settlers, and of the gradual change from deep forests to fertile farms. This book will be of absorbing interest to all students of American history, and especially to those who have any association with the picturesque Mohawk Valley. It is a handsome volume, sumptuously illustrated with numerous beautiful photogravures. Published by G. P. Putnam's Sons. Price, $3.50; postage additional.

THE RURAL NEW YORKER,
409 Pearl St., New York.

MARKET NOTES

EGGS are up one to five cents, the latter figure being the rise on fancy fresh. Cold weather in the producing sections has discouraged the hens, and they are taking a longer vacation than usual. The continued scarcity of fresh receipts has caused a decided firmness in the better grades of refrigerators.

MILK SHORTAGE.—The storm of December 14-15 did so much damage to the railroads supplying New York that milk trains were all delayed. Delaware and Ulster counties, from which large quantities come, were entirely cut off. Dealers say that Monday was the worst day in the milk business since the blizzard of 1888. Prices doubled, and in some cases went as high as $5 per 40-quart can. Middlemen, under contract to furnish hotels and clubs, telegraphed for all that they could get from nearby New Jersey dairies, and bought here and there of small dealers, who could neglect customers for one day without serious damage to their own trade.

APPLE WOOD.—We are asked whether there is any extensive demand for this wood in New York. Some time ago we made a quite thorough canvass of the dealers who might be expected to handle it, and were unable to find any who appeared to be much interested. Formerly large quantities of apple wood were used in the manufacture of pipes in imitation of briar, but a kind of gum wood, which can be worked to better advantage, has largely taken its place. There is a limited use for apple wood in the manufacture of tool handles, but most of these factories are in smaller towns, and are able to get all that they need from neighboring farmers at little above cord-wood rates.

LABEL AND QUALITY.—On page 749 "Niagara White Grapes," packed by No. 723, were mentioned as sought by a buyer because he had had the same man's pack before, and found them first-class. That label, with the quality behind it, was an excellent advertisement. The number gave the package a personality, showing the buyer that the packing had been done by somebody who was willing to stake his reputation on the contents of the basket. As a contrast to this, showing the worthlessness of a label unless it stands for merit and places the responsibility for packing upon some one in particular, the following is a fair illustration. I bought a small basket of Catawbas bearing the label of the Lake Keuka Grape Marketing Co., Lyon brand. The statement was made on the cover that every bunch was carefully selected. That might have been true, but evidently they had selected the smallest and poorest for that particular basket. The bunches on top were of fair size, but the others were so small and inferior that the packing could not have been an accident. Whoever fixed up those grapes meant to deceive the buyer. Of course, it does not necessarily follow that the company whose name was on the package was responsible for the poor quality of the fruit, for the label might have been stolen, and there was no special packer's number to lay the blame to. It is hardly to be supposed that a company would go to the expense of getting up a mark to advertise their goods, and then counteract all the good effect of the advertising by a wilful deception. This system of branding is certainly defective. A label without any personal packer's mark or number is easily stolen and used by others as a cloak for poor quality.

GYMNASTICS BY MAIL.—A reader asks:

"Are the offers of physical instructors so persistently advertised worth investing in or not? They charge from $10 to $15 for their system, to be paid in advance, of course, giving their assurance only as guaranty of satisfaction."

Probably the claims made by many of these people are rather extravagant, yet, as a rule, their methods of exercising are reasonable, and a healthy person who follows them out carefully will be surprised at the bodily development gained. The regular employment of the majority of people does not call for the use of nearly all the muscles, and hence any system that will exercise these unused muscles properly is a good thing. The blacksmith's arm is usually out of proportion to the rest of his body. About the only men whose bodies are uniformly developed are the professional athletes, and this uncommon bodily strength is not infrequently gained at the expense of mental discipline. While the suggestions of professionals are of value on account of the attention they have given to these matters, we should not care to pay any large sum for this instruction by mail, as a person by carefully studying himself and using common sense and persistence can get up a set of exercises that will to a certain extent answer the same purpose. There is great advantage in a regular system, for one is more likely to carry it out faithfully than if he goes at it in a haphazard way. Of course, those who have any weakness should be careful not to overdo in exercising, as this will result in more harm than good. Few people have the time for the training necessary to become athletes, but an intelligent use of 10 minutes a day in filling the lungs with air and stirring up the sleepy muscles will straighten up the hollow chested and give new ideas of life to many who continually feel worn out. "How to Get Strong," by Blaikie, is an instructive manual on this subject.

W. W. H.

NEW YORK STATE DAIRYMEN MEET.

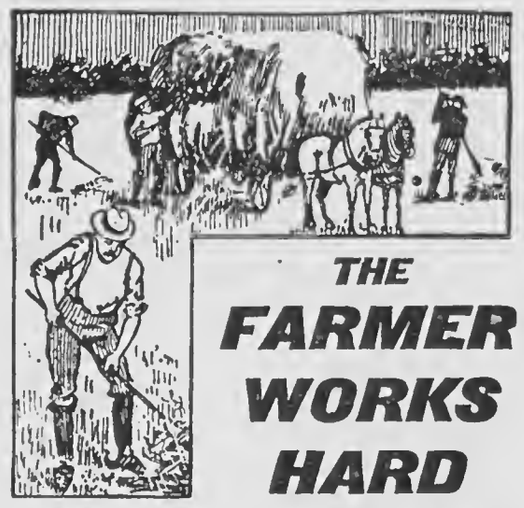
A Good Meeting at Olean.

PART II.

In speaking of oleomargarine legislation, Hon. Wm. Grout said: "In 1889 there were 104,000,000 pounds of this spurious stuff made and eaten as butter. Only a limited quantity of it found its way through the retail dealers, and the greater part of it was consumed at hotels, restaurants, large boarding houses, etc., these being furnished by the manufacturers direct. It sold at the price of butter. Whenever you took a meal away from your own house—not at the home of a neighboring farmer, for farmers don't have to use oleomargarine, but at a hotel, eating house, in city or village, it was one chance in nine that you were eating oleomargarine in the place of butter. What is the secret of this great fraud's success? There is money in it. The 104,000,000 pounds would give a clear profit to the makers of $15,000,000. The State laws have been as well enforced as they can with the means at command. The only remedy for this fraudulent sale is taxation by the National Government. The substance of the whole business is, here is a great fraud; shall it be stopped? That is the question in which the whole body of American people are concerned. Think what a reproach it is to us that it should be so. It puts under suspicion every pound of honest butter sent abroad. We can put this tax upon it. Let us do it."

Major H. A. Alvord spoke on some features of dairying in Europe. He said that in the islands of Jersey and Guernsey two grades of cattle have been raised and kept pure for centuries. Pasturage is high, and the cattle are tethered and watched by women and children. In Normandy, on the coast of France, we find larger, coarse-boned cattle. The farmers have no means of cooling milk, and know nothing of what they lose in butter fat. The butter is sold fresh, salt being used only as a cover for poor quality. The milk supply of Paris is shipped in on open flat cars in all kinds of weather, and is not expected to remain sweet for any great length of time. In Ireland there are many coöperative butter factories. In England and Scotland the production of milk comes first, and the demand for this is not fully met. The two types of English cheese are Cheddar and Stilton. "I found nothing in the length and breadth of Europe in which American dairymen do not excel, and we need not be ashamed to hold up our products in competition with those who have been engaged in the dairy industry for centuries."

Assistant Commissioner Flanders spoke on oleomargarine legislation, and the need of interstate laws to protect New York cheese makers. Mr. Grout made the statement that large quantities of oleo are annually sold in New York State, but Mr. Flanders showed how the State Department has been able to handle the fraud and corner it.

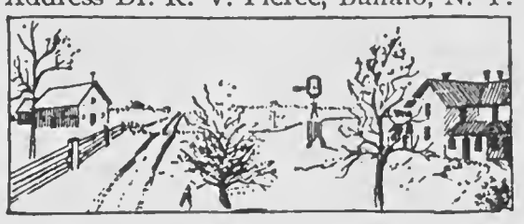


THE FARMER WORKS HARD

For a living. He has to. He must "make hay while the sun shines," no matter how he feels. The result is overwork. The stomach usually gives the first sign of strain. The organs of digestion and nutrition are deranged. Food does not nourish. Indigestion appears. In such a case Dr. Pierce's Golden Medical Discovery re-establishes the health by a complete cure of the diseased organs of digestion and nutrition. It cleanses the stomach, purifies the blood and removes the causes of disease. It is a temperance medicine, and contains no whisky nor alcohol.

"I was troubled with indigestion for about two years," writes Wm. Bowker, Esq., of Juliaette, Latah Co., Idaho. "I tried different doctors and remedies but to no avail, *until I wrote to Dr. Pierce* and he told me what to do. I suffered with a pain in my stomach and left side and thought it would kill me. I am glad to write and let you know that I am all right. I can do my work now without pain and I don't have that tired feeling that I used to have. Five bottles of Dr. Pierce's Golden Medical Discovery and two vials of his 'Pleasant Pellets' cured me."

Sick people can consult Dr. Pierce by letter free. All correspondence private. Address Dr. R. V. Pierce, Buffalo, N. Y.



RHEUMATISM

The Dr. Von Post great Holland Remedy, "QUICKRELIEF," in capsule form, QUICKLY CURES RHEUMATISM IN ITS WORST FORMS. No free doctors. No free samples. No free humbug, but an HONEST and special QUICK RELIEVING remedy. Don't wait and suffer. Price, by mail, $1 per hundred, or send 25 cents in silver and get 25 capsules for trial. Your "quarter" back if not satisfactory. JOHN H. POST, Deep River, Conn.

Live Stock and Dairy

AILING ANIMALS.

Gangrene of Tail in Cow.

My cow has gangrene of tail. How may I cure it? Will it affect the healthfulness of the milk for family use? Will her calf, dropped in May next, inherit the disease? If the cow cannot be cured, is it safe to butcher the cow or her calf? E. W. K.

New York.

If it be near the end of the tail amputate it one joint above. If near the roots a veterinary must treat it. If only a joint at the extremity is involved the cow's health will not be seriously affected, and her milk will be wholesome for human food. The calf will not inherit it. If she cannot be cured her meat is not wholesome food, but her calf would be sound at birth as far as the mother's disease is concerned.

Horse Out of Condition.

I have a horse about 13 years old, usually spirited and a willing traveler, scarcely ever needing spur or whip. For the past three weeks or so, he has been sluggish. Will start off briskly, but after going a short distance, frequently stops suddenly, as if out of wind. The horse was never known to balk in the eight years I have owned him. He will spurt up awhile from touch of whip. He shows this disposition more in mornings than at other times. In afternoons he appears to have more life and go about him. Can you tell me what the trouble is, and a remedy? Manure and urine seem to be normal. Feed—corn on cob and blade fodder. Eats heartily. J. F. C.

Charlotte Hall, Md.

Your horse may have no disease at all. If any it is a heart trouble of some nature which would require a personal examination to determine. My opinion, however, is that your feeding exclusively upon ear corn and fodder is the sole cause of his lifeless condition. Corn can fatten when digested, but a 13-year-old horse does not often masticate it properly, consequently the corn is not well digested, but even if it was it does not contain protein enough to furnish nerve and muscle energy. Your blade fodder no animal could work upon, and hardly live upon. An animal might eat of it to near the point of bursting its stomach, and yet not be fed. Get some good, fine, well-cured mixed hay and feed; procure some oats and mix two-thirds oats, one-third corn. Have them ground and feed, and, I think, you will have a horse of more life.

FEEDING BEEF CATTLE AND HOGS.

I wish to feed some two-year-old cattle for the Spring market. Would I better get my corn shredded at three cents a bushel, and mix with oats and get it chopped at six cents a bag for chopping, or would I better feed it just as it is and let shotes follow the cattle? My corn was planted with a drill four feet apart, and cut with a harvester, and I have it all in my barn. Would you advise keeping my cattle in the basement, or let them run out in a large roomy shed during the day? I have an abundance of water in the basement; also in the shed. I have mixed hay, wheat and oat straw for roughage. Would I better sell my wheat at 70 cents a bushel and buy shorts at $18 a ton for pig feeding, or grind my wheat at six cents a bag for grinding? What way would you advise feeding shorts to pigs, soak it from one feed to another, or scald it? U. G. B.

Ribble, Mich.

With the present high price of all feeding stuffs, the greatest economy should be followed in their use. Consequently I should rather pay six cents a two-bushel sack and feed ground feed, than feed whole grain. To be sure if hogs followed the steers, the loss of grain would be comparatively small, unless fed out of doors and snow covering the manure more or less. In feeding trials in Kansas, steers fed ear corn in one experiment made slightly better gains than those fed cornmeal, but it required six per cent more grain to do it. In a second trial, a saving of 35 per cent was made by grinding. This, however, was an excessive amount. Where shotes followed steers fed ear corn they obtained more than half of their feed from the droppings. As a general thing, however, it is my belief that well-ground feed gives greater returns per pound fed than does the coarse or complete grain or seed. It is simply a question then as to cost of grinding. At this time I believe it will pay to grind at the price given by U. G. B. If one can shred his stover and get it under cover in dry condition, he will not be likely ever to want to feed the entire stalk again. The shredded material is eaten more economically, keeps better through the Winter than shocks out of doors, handles better in the manger, feed lot or feed trough, and what may be left makes good bedding, and is readily converted into manure that can be handled easily. I would by all means turn the cattle into the open air and sunshine every day if possible, or let them run to a roomy shed for shelter. It is more healthy than the basement barn.

You certainly will do better to sell your wheat at 70 cents a bushel and buy shorts, rather than feed wheat. You can get more nutriment from a ton of shorts than from the wheat, and you will save money by the operation in addition. In feeding experiments at the Indiana Station hogs were fed cornmeal and shorts, dry, and also mixed with water in varying proportions. The pigs given the dry feed did slightly the best of the four lots fed. If one finds it somewhat more convenient to feed a slop, then it is advisable to use about twice as much lukewarm water in Winter as the grain amounts to, mixing the water with grain at the time of feeding. It is not necessary either to soak or scald.

C. S. PLUMB.

THE MILK SITUATION.

The milk business is not being carried on very extensively. Milk is bought at the shipping station by the Starlight Dairy Co., for which they pay $1.27 per can of 40 quarts. Feed is very high; meal, $1.50 per 100; middlings, $1.50, and other feeds in proportion. The hay crop was an average one. The cold weather which we have just been having has dried off the cows amazingly. Farmers had to commence feeding about one month earlier this year, which will make the feeding season a long one, and will undoubtedly make a scarcity of hay. The F. S. M. P. A. is not being conducted in this section. V. T. W.

Starlight, Pa.

Supplies of milk at shipping station here are running low. The cold wave and snowstorm that struck us a week or more since made it necessary for dairymen to yard and stable the stock and supply them wholly with dry feed. The change of feed and temperature has nearly cut the supply of milk in half, so that the shipping station and milk dealers in Towanda found themselves short, and have been out canvassing among butter-making farmers for milk to supply their regular customers. Our shipping station here is owned by Piollets, and leased by parties in Scran[illegible] pay the patrons the New York Exc[illegible] price, less 26 cents per can the year through, payment being made on the 15th of each month for all milk delivered in the month previous. At present there are 20 patrons hauling and about 13 40-quart cans received at station, leaving the shipper from 15 to 20 cans short on supply. The milk usually goes to Scranton and Wilkesbarre, but this Fall and Winter it goes to New York, a portion in cans and remainder in bottles. Cows are going into Winter quarters in fair condition, but the yield of milk is much less than it was last year at this time. Feed of all kinds is high, and farmers are not feeding to make milk, as they can see no money in it even at present prices. The calves are nearly all deaconed or vealed, mostly the latter, for which there is a good demand at fair prices. Farmers here are coming to the conclusion that making milk at middlemen's prices is not a very paying business, and are slowly reducing stock and giving more attention to other lines of farming that they hope will pay better. Our local F. S. M. P. A. is still alive, but not very active. Many of our original membership have dropped out, or failed to pay dues, leaving a few of the faithful who, though unable to accomplish much, are still pleased and rejoiced at the successful coöperative movement in other parts, believing that the time will yet come when the milk producers will have a word to say about the price of their valuable and indispensable product. E. G. O.

Wysox, Pa.

THE past year has been such a busy one that I raised two pigs instead of caring for chickens, and when my now big porkers are sold think for the time and feed spent upon them they will pay better than the hens would have done. MRS. G. L. ROSS.

Wisconsin.

My herd of 40 purebred Holsteins is doing extremely well and is in nice, thrifty condition. I have a herd of about 80 hogs, the major portion of which are purebred Berkshires. My hogs are also doing well. Pork is bringing a good price in this locality. There is a new creamery being erected at Delphi which we trust will help the farmers in this locality on the price of milk. Our milk at the present time goes to New York from the shipping station at Oran. W. W. CHENEY.

Manlius, N. Y.

INDIANA CATTLE DYING.—Many cattle are dying in certain localities in Indiana from the effects of eating cornstalks in the field. The theory was first advanced that the smut on the stalks occasioned the animal's death. This theory, however, has been proven erroneous. Dr. Klatz, Assistant State Veterinarian, proved this theory to be wrong by experimenting by feeding cows a bushel each of the smut gathered from the stalks each day. This he kept up for several weeks, and to his surprise the bovines thrived and gave more milk than usual. He is unable to explain the exact cause of the trouble, but advises all farmers to abstain from turning their cattle into stalk fields. R. D. F.

10 Weeks for 10 Cents. You have several neighbors and friends who need THE R. N.-Y. We are going to help you to see that they get acquainted with it. For our part we will send the paper to them now 10 weeks for 10 cents—a cent a week. We ask you to call their attention to this offer. Perhaps you can get up a club. The 23 largest clubs will each get a cash premium January 1. Will you be one of them?

Tuttle's Elixir

Cures all species of *lameness, curbs, splints, contracted cord, thrush, etc.* in horses. Equally good for internal use in *colic, distemper, founder, pneumonia, etc.* Satisfaction guaranteed or money refunded. *Used and endorsed by Adams Express Company.*

WHAT BULL FOR LARGE BUTTER COW

A reader in New York State says that he has a herd of cows that are purebred or are three-fourths Jersey. They are small, and in order to sell his surplus stock to advantage he must have a bigger and heavier animal. At the same time he wants to keep his cream yield up. He will have to buy a purebred bull next Spring, and wishes to know what breed he can get to increase the size of his cows, and at the same time keep up the butter yield.

It is doubtful whether your correspondent can combine with economy dairy and beef qualities. If this plan is to raise steers from the male offspring he might increase the size of his stock somewhat by the use of a Guernsey bull, and still get heifers of a good butter type. We would not advise the use of a bull of any of the beef breeds, nor even a Holstein, if butter is the chief object sought after. A Guernsey bull, of high breeding, from some good butter strain, will give larger offspring than a Jersey, and will probably transmit butter qualities fully equal.

C. S. PHELPS.

Your reader should purchase a Guernsey bull of a large family, that is, one from a large sire and dam. We have had them nearly as large as Short-horn bulls. If the larger specimens of the Guernseys are crossed with the Jerseys, the yield of cream will not be diminished, its color will be improved and the size of the offspring enlarged about 20 per cent. These breeds cross very kindly, whereas if the small Jersey be crossed with the Holstein, or, in fact, with any other of the milking breeds but the Guernsey, the likelihood is that the calves will be unlike in size and in milk and cream production. I. P. ROBERTS.

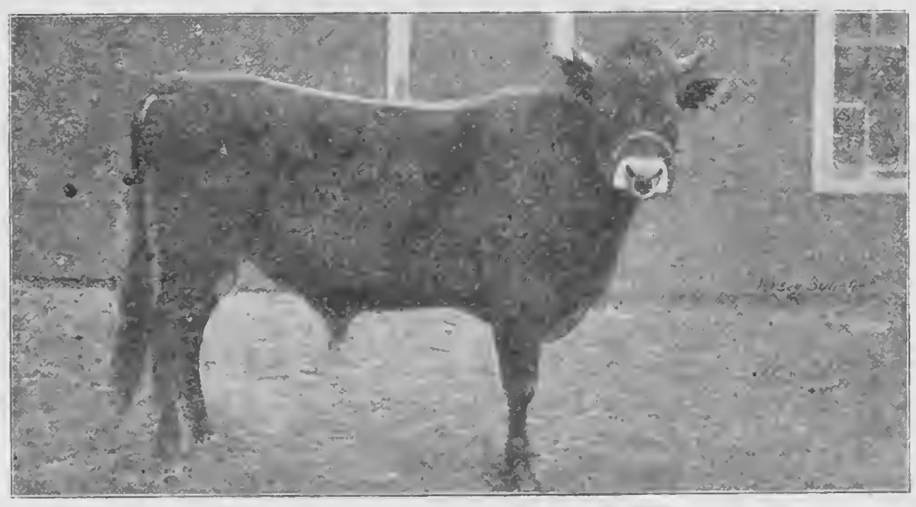
The use of a large, fleshy type of Guernsey male would naturally produce larger offspring, and still keep up the quality of the milk. Further, this cross would in all probability be a very harmonious one, as the Jersey and Guernsey come from a common ancestry, and even to-day have much in common. Logically, this is the best cross, if the surplus stock is to be sold for dairy purposes, and the heifers raised to become dairy cows. If, however, the butcher is the party to be catered to then another cross would seem more fitting. If, for example, an Ayrshire male could be secured, that came from an ancestry that produced milk rich in butter fat, the object might be attained. A Red Poll bull from a rich milk strain could also be used, and this last would give calves that would be the most salable to the butcher. Violent crosses on small cows are quite undesirable, and the suggested Red Poll male is the most violent of the three. A large bull will be more or less apt to sire large calves, and then the danger of difficult calving will be more likely to occur than where a more harmonious mating is used. Personally, I should be disposed to use the Guernsey male, and then if necessary mate the larger females of this cross to a larger type of bull if wanted. Why not buy and develop a high-class strain of deep-milking Short-horns or Red Polls instead of crossing at all? C. S. PLUMB.

There are two courses of action open to your correspondent. The first, and to my mind the more desirable one, is to select a Jersey sire from a family of this breed noted for their size, vigor and rugged constitutions. The individual should be large with a very masculine appearance. A great injury has been done the Jersey breed through the selection of Jersey sires having a "cowy look." It is not at all incompatible to have a bull full of strength, vigor and masculinity, and yet possessed of all the quality that could be asked for. Many of our breeders and dairymen have mistaken delicacy and effeminacy in a bull for quality, and the result has been disaster. There are a number of Jersey breeders, especially in the West, that are doing their utmost to undo much of the injury that has been done this magnificent breed of dairy cattle through the use of such bulls, and I should be very glad to give your correspondent the names of some of these men, whose first consideration in selecting a Jersey is evidence of a vigorous constitution. The second course that might be pursued, and one that has been followed by a number of dairymen in Wisconsin with very satisfactory results, is to purchase a strong and vigorous Guernsey bull possessed of dairy quality, and cross him on these grade Jersey cows. There is apparently something invigorating about the introduction of an outcross of blood from another breed with purebred animals that infuses them with fresh life and vigor at once. Why this should be so is not so easily explained, but the fact remains. The Guernsey and Jersey breeds are so nearly the same in their breed characteristics that the cross is not a violent one, and to use a common expression "nicks" remarkably well, the offspring being very uniform in type and quality, and make excellent dairy animals. The Guernseys as a breed are larger, stronger, and as a consequence are more popular to-day in many dairy districts than are the Jerseys. Either one of these courses should lead to the desired result. W. L. CARLYLE.

Madison, Wis.

A WELL-BRED JERSEY BULL.

George E. Peer says in regard to the young bull pictured at Fig. 395: "It might be stated that Melia Ann's King 56581 was bred to order. Having purchased his sire, I bred him to Lottie Melia Ann 100775 (who is a sister of Pride's Olga 4th, with a test of 17 pounds ½ ounce from 420 pounds nine ounces milk, both being sired by the same bull), with hopes of securing a bull fit to head my herd. In this my expectations were fully realized, and Melia Ann's King was the result. Next to his famous sire he is the highest standard-bred pure St. Lambert-Melia Ann bull living, and the only one with 50 per cent of old Melia Ann's blood." The picture was taken in his 17-month form. His sire was Melia Ann's Son 22041; he in turn being sired by Lucy's Stoke Pogis 11544, and out of the great old cow Melia Ann 5444, who has a butter record of 18 pounds ½ ounce in a week made upon grass alone. The dam of Melia Ann's King 56581 is Lottie Melia Ann 100775, with a test of 21 pounds two ounces from 305 pounds of milk in seven days, her sire being Melia Ann's Stoke Pogis 22042, sire of 10 tested cows, among them Pride's Olga 4th 96870, the sweepstakes cow at the Pan-American, whose record of 65¼ pounds of milk in one day, 420 pounds nine ounces in seven days, and 27 pounds ½ ounce of butter in a week, is well-known to the readers of THE R. N.-Y. The dam of Lottie Melia Ann 100775 is Melia Ann 3rd 68070—375 pounds eight ounces of milk and 28 pounds eight ounces of butter in a week. Melia Ann 3rd is a full sister to Melia Ann's Son 22041 and to Melia Ann's Stoke Pogis 22042.



THE JERSEY BULL MELIA ANN'S KING 56581. FIG. 395.

HOW MUCH MEAT FOR HENS?

My feed for my White Leghorn hens and pullets is one-third each of corn, wheat and buckwheat mixed morning and night (what they will pick up clean); at noon, one-half by weight of bran and gluten meal, one-third cooked potatoes, all wet up with sweet skim-milk, also meat scraps, cabbage or beets for green food. Can I better the ration? They are looking fine, but are not laying yet; were hatched in April and May. Could I use basswood boards, just sawed, from a tree cut last Spring to put on the under side of my rafters to henhouse, to stuff with straw (like Van Dreser), or would they be too damp? G. L. F.

G. L. F. does not mention the amount of meat scrap used in the mash, which is one of the most important parts of the food for good results in egg production. I have had the best results, usually, in feeding about four to five pounds daily to each 100 fowls. If the food is mixed with milk, as in this case, I should feed about one pound of meat to each 25 hens. I should either use cut clover hay, about one-half the whole bulk of the food in the mash, or else give them clover hay, cornstalks, etc., to pick at as they want. To anyone who has never given his fowls such it will be surprising the amount of these bulky feeds they will eat. On most farms there is a large amount of hay seed, clover leaves, etc., that will accumulate under the mows, where the hay is thrown down for the stock. This in many instances goes to waste, while if it were given to the fowls they would turn it to good account. The grain food should be fed in litter, so they will have to scratch for it; a busy hen is a healthy one. Cut cornstalks make the best scratching material I have ever tried. G. L. F. does not mention anything about grit and clean drinking water, but as he says they are looking fine I judge they are both supplied. I should not hesitate to use the unseasoned basswood boards for lining. If the roof does not leak and the location is high and dry, the house is opened on bright days and kept closed as tightly as possible on cold nights, there need be no fear of bad results from dampness. J. E. S.

A CARD.

PARIS SEPARATOR AWARDS.

The De Laval Cream Separators received the **GRAND PRIZE** award at the Paris Exposition, in the name of "SOCIETE ANONYME SEPARATOR," which is the French translation of "AKTIEBOLAGET SEPARATOR," the Swedish name of the De Laval European organization, both names meaning "SHAREHOLDER'S SEPARATOR COMPANY, LIMITED"

The repeated misrepresentation of the VERMONT FARM MACHINE Co. (manufacturers of the so-called "U. S." separator) in this regard, culminating with the malicious falsehood that no such award was made and that the De Laval Company is guilty of "lying" in so claiming brings the matter to a point where common business self-respect demands that some radical action be taken.

We have, therefore, this day instructed counsel to at once take such legal steps as may be justified and proper in the circumstances against both the VERMONT FARM MACHINE Co. and, where practicable, such papers as may have given advertising publication to these false and libelous statements.

THE DE LAVAL SEPARATOR CO.

New York, Dec. 17, 1901.

MORE PROOF SHOWING THAT THE DeLAVAL CO.
ARE TELLING THE TRUTH WHEN THEY ACKNOWLEDGE THAT THERE
HAS BEEN LYING ABOUT PARIS SEPARATOR AWARDS

In our last advertisement we referred to three statements that were in a recent DeLaval advertisement, by which they hoped to make readers believe that the name "Aktiebolaget Separator" did appear on the official list of awards distributed at the Paris Exposition and claiming "Aktiebolaget Separator" to be their European organization, regardless of the fact that less than a month before they claimed "Société Anonyme Separator" to be their European organization. However, they dropped this latter claim like a piece of hot iron when we proved that "Société Anonyme Separator" exhibited at Paris a Butter Radiator and not a Cream Separator, and are again claiming "Aktiebolaget Separator."

One of the letters referred to purported to be signed by U. S. Consul-General at Stockholm, Sweden, under the date of April 17, 1901, reads as follows:

"From evidence this day furnished me I am able to certify that the Separator Company, Ltd., (Aktiebolaget Separator) of this city did receive the 'Grand Prize' for their Alpha-DeLaval Separators at the Paris Exposition in the year 1900, as per announcement in the 'Journal Officiel' Paris, of August 18, 1900, this day presented at this office."

NOTICE, this statement says "as per announcement in the 'Journal Officiel' of August 18, 1900."

As to the truth of this we ask the readers to examine the photographic reproduction given herewith of the list of winners of the Grand Prize at Paris in Class 37, the one in which cream separators and other dairy goods were entered, as published in the 'Journal Officiel' dated August 18, 1900, and see if they can find the name of "Aktiebolaget Separator." We cannot and do not believe anyone else can.

Also notice the date of the statement—April 17, 1901, then bear in mind that seven months later, in November, 1901, the DeLaval Co. claimed their award through the "Société Anonyme Separator," but being cornered, they go back to their former claim that the award came through the "Aktiebolaget Separator."

In the light of this photographic re-production and these statements we claim that our statement that the Official List of Awards published and distributed at the Paris Exposition contained no mention of any award to the DeLaval Separator Co. or the Aktiebolaget Separator is absolutely true.

The sum and substance of the whole matter is it is terribly galling to the DeLaval Separator Co. to be continually beaten by the United States Separator, and they attempt to bluff off their defeats by publishing all sorts of statements in their advertisements, claiming first one thing and then another. It shows that they have very little respect for the intelligence of readers when they make separate and contradictory claims within two weeks of one another.

No. 3 "Prize"
The Best Feed Grinder Money Can Buy for Any Kind of Power, from 1 to 5 Horse Power.

WHY? Because it rapidly grinds corn, oats, barley, rye, etc., into splendid feed, and will make table meal and graham flour as well; has ample capacity for 4 or 5 horse power, and an automatic shake feed with perfectly adjustable feed slide which prevents choking down the lightest power; is built throughout of iron and steel, and will last a lifetime. Thousands in use for 10 and 15 years—still as good as new. We make 26 sizes and styles of Feed Grinders; also a full line of Fodder Cutters, Huskers, Shellers, Wood Saws, Sweep Horse Powers, Tread Horse Powers, Windmills, etc. Catalogue Free. Appleton quality is the best and is made only by the
APPLETON MFG. CO. 27 FARGO ST. BATAVIA, ILL.

IT TAKES TWO PAILS

to hold the milk of one cow when she is properly fed. Correct dairy feeding means the use of ground feed exclusively in the grain ration. Experienced men will tell you
The Scientific Grinders
grind ear corn and other grains faster and more cheaply than it can be done in any other way. We make numerous grinders, sweep and power. Don't buy until you see our catalog R Mailed free.
